The Rise of Prussia. It was reserved for Prussia to weld the fragments into a new and more powerful state. In the 15th century a Hohenzollern had received the March of Brandenburg; a series of able descendants gradually built up a considerable province. Prussia's greatness, however, begins with Frederick I; he laid the foundations of the military system, and saved the money to run it. His son, Frederick the Great (1740–86), had the genius to employ his heritage, and the ambition to increase it. No sooner had he ascended the throne than he advanced a claim of the house of Brandenburg to the Silesian principalities, and when Maria Theresa (1740–80) of Austria—which had tried to weaken Prussia's growing power—rejected the claim, he promptly seized the disputed territory. This seizure was confirmed, after the War of the Austrian Succession (1741–45) had ended in the recognition of Maria Theresa's husband, Francis I, as emperor, in the Peace of Dresden (1745). But Austria was still resentful, and the issue was finally fought out in the Seven Years' war (1756–63), in which Frederick's extraordinary military genius triumphed over apparently irresistible coalitions. Prussia was now a military power of the first rank, and in the foundation of the Princes' League (1785) assumed for the first time a leadership in German affairs.

This initial movement toward a union of the North German states was halted for many years by the French Revolution and the Napoleonic wars. Divided, Germany was an easy prey for the conqueror and lay helpless before him until 1813, when the war of liberation, in which Russia, Austria, and England participated, finally terminated his sway in the great battles at Leipzig and Waterloo (1815).

At the Congress of Vienna (1815) a German Confederation was formed, with Austria as president of the federal diet. Constant agitation for the recognition of popular sovereignty, encouraged by the Parisian revolutions of 1830 and 1848, led to constitutional government in several German states, and to the attempt to set up a federal constitution. The crown of the empire was indeed offered to Frederick William IV of Prussia, but on condition that the Prussian state should be broken up into its several provinces. To this the interests of Prussia were utterly opposed, and the entire plan met with shipwreck.

Founding of the German Empire. Enmity to Austria had already borne fruit in her exclusion from the new constitutional state; and when, after the Schleswig-Holstein campaign of 1864, Prussia and Austria could not agree on the partition of the acquired territory, the step to armed conflict was not great. Hence the war of 1866, in which Austria was decisively defeated, and which resulted in the formation of the North German Confederation. Neither Austria nor the South German states were members, but the latter had formed with Prussia a secret offensive-defensive alliance. The time was nearly ripe for a closer union of the German states, and it was a sudden political crisis that made it possible. The war of 1866 had brought Germany and France near to the breaking point, for the insensate ambition of Napoleon III saw a threat to his power in the imminent union of the German people. A point of honor, arising out of the disputed succession to the Spanish throne, led to a declaration of war in 1870, in which, however, Napoleon found himself opposed both by the North German Confederation and by the South German states, whereas neither Austria nor Italy was ready for war. The struggle was brief, and in 1871 William I of Prussia was proclaimed German emperor.

Industrial and Social Progress. Germany now entered upon a long period of peaceful growth, marked at the same time by extraordinary industrial activity. France had been compelled to pay as indemnity the enormous sum—as it was then considered—of five billion francs; and the investment of this money in Germany resulted in a fever of speculative enterprise in every direction. At the same time there were profound social changes going on. The rise of the industrial magnate had done two things: it had weakened the power of the old landed gentry (Junker); and it had developed a new class, the proletariat. Thence originated the spectacular rise to power of the Socialists, who, despite measures designed to limit their voting strength, rapidly grew to such proportions as a political party that they had to be seriously reckoned with. Only the astute policy of Bismarck, the "iron chancellor," prevented grave disturbances. His plan was, essentially, to steal the thunder of the Socialists by putting into effect the reforms which they advocated.

International Rivalry. It was not hard to suggest to this newly self-conscious nation an ideal of military prominence, if not of world domination, and such a program appealed to the young kaiser, William II, who ascended the Prussian throne in 1888. Gradually the entire foreign policy was shaped along lines of power and military action. The army was steadily strengthened, its organization improved; presently a navy came to the fore. And the German people approved, for they were convinced that their national life was threatened.

The European situation had indeed grown more and more tense. The Triple Alliance (1882), between Germany, Austria, and Italy, was balanced in 1892 by a similar understanding between France, which wanted revenge for the loss of Alsace-Lorraine (1871), and Russia, which had become estranged from Germany. The age-long desire of Russia to play a dominant rôle in the Balkans and to gain control of Constantinople threatened to force a conflict with Austria, which would bring in Germany.

Meanwhile, Great Britain also had been drifting into the hostile camp. In the year 1884 Germany had inaugurated a colonial policy which eventually led to the development of a large navy. In this step England saw a menace and a challenge which she could not ignore. The lifeblood of England is overseas commerce; her food is largely imported in ships; a naval blockade could starve her out in three months. Vainly she attempted to secure Germany's consent to a halt in the race of armaments. And Germany's attitude toward the efforts for international peace, signalized by the Hague Conferences, served to strengthen the suspicion that she was bent upon war. In another respect also Germany had crossed the lines of English policy. William II had cultivated the friendship of Turkey with a view to securing valuable concessions in Asia, the fruit of which was to be the famous "Berlin to Bagdad" railway, with its allied plans that threatened to imperil British interests in the Orient.

It was natural, then, that England should begin to feel a community of interest with France, one of the first fruits of which was the agreement of 1904 with respect to Morocco. Germany felt in this a blow at her commercial interests there, and forced the conference at Algeciras (1906) to grant her recognition as the price of peace. But Europe had now heard the rattling of the German sword, and plot and counterplot followed on each other's heels. The next dispute that threatened the peace of Europe arose from the annexation of Bosnia and Herze-

govina by Austria in 1908. Serbia protested, and Russia supported the protest, but finally withdrew her opposition, feeling herself weakened by the disastrous war with Japan (1906), and hence not yet ready to try conclusions with the powerful military machine of Germany. Nevertheless, she remained secretly unreconciled, and proceeded on her part with military preparations.

World War I. By this time Germany had become the most efficient military power the world had ever seen. Such was the situation when, in June 1914, the Austrian heir apparent and his wife were assassinated in the streets of the Bosnian capital. Within two months the enmities of western Europe had burst forth into conflict and produced the then-greatest war of history. (See *World War I.*)

The German Republic. One of the most dramatic events attending the armistice was the German revolution of November 9, 1918. The disaffection on Germany's "home front," as von Hindenburg called it, had reached the point of open rebellion. The kaiser, forced to abdicate, fled to Holland, and within a short time every hereditary ruler in Germany had abdicated or been deposed. A temporary government provided for a constituent convention, which drew up a democratic constitution. Two armed attempts were made by communist groups to establish a socialist commonwealth similar to that in Russia. These were the so-called Spartacan revolts in Berlin and a communist revolt in Munich, all in the early months of 1919. They were ruthlessly suppressed, and the constitution was adopted on July 31, 1919.

There were two attempts by monarchist partisans to overthrow the democracy. Under the leadership of Kapp, in 1920, this group held Berlin for five days but was defeated by means of a general strike. In 1923, a similar insurrection broke out in Bavaria, led by Erich von Ludendorf and a young Austrian named Adolf Hitler. The leaders were captured, and Hitler was imprisoned.

Friedrich Ebert was the first president of Germany. His policy, pursued also after his death in 1925 by his successor, Paul von Hindenburg, was directed toward a peaceful defeat of the Versailles treaty by combined sabotage and conciliation.

Reparations Problem. The peace treaty fastened on Germany the payment of large annual sums as reparations. The result was a runaway inflation. The Allies declared Germany in default, and French troops, in January 1923, seized the Ruhr valley. Germany then refused all payments. The deadlock was broken by the Dawes plan, named from Charles G. Dawes, the American chairman of the commission framing it. The amount of the annuities was fixed, and the French left the Ruhr in 1925. Four years later a new arrangement fixed also total reparations. In 1931 came the depression, and the Allies cancelled their claims.

Nazi (*nä'tsē*) **Rule.** Hitler, having failed in the revolt of 1923, proceeded to organize a political party (Nazi) from the extremists of the right and the discontented middle class. It was anti-communistic and ultra-nationalistic. Its power grew phenomenally, and Hitler was a close rival of Hindenburg for the presidency in 1932.

Appointed chancellor in 1933, Hitler seized the opportunity of a fire in the Reichstag to ask for dictatorial power to suppress the Communists, who were accused of causing the fire. Receiving the powers sought, Hitler proceeded to establish a totalitarian state, suppressing all other parties. His policy aimed at aggrandizement abroad and was based on glorification of the Nordic race. Aspects of this policy involved persecution of the Jews and the encouragement of a revised form of Protestantism, based on old Teutonic myths.

Under Hitler's leadership, Germany ignored the disarmament clauses of the Versailles treaty, withdrew from the League of Nations, and proceeded to build up her military might. One immediate aim of German foreign policy remained union with Austria, although consideration of Italian jealousy and of French opposition counselled delay in its realization. The method used in seeking control of Austria and other countries was to foster the organization of a Nazi party, which, with German help, was expected eventually to obtain the reins of power. This technique facilitated the acquisition of both Austria and Czechoslovakia in 1938-39. France and Britain agreed, in a conference at Munich, to Germany's taking over a part of Czechoslovakia. But when the remainder was taken over contrary to agreement and Poland was next attacked in 1939, these countries declared war on Germany in the face of a German-Russian non-aggression treaty.

World War II. During the first three years of the war, Germany was everywhere victorious. She conquered Poland, Denmark, Norway, Holland, Belgium, France, and the Balkans. But Britain remained unsubdued. Then in 1941, Hitler threw his armies against Russia, penetrating as far as the Volga and the Caucasian oil fields, but failed to take Moscow or Leningrad. The United States entered the war in late 1941. In 1942, the tide turned. Defeated at Stalingrad and in North Africa, the German armies everywhere gave ground. In 1944, Germany itself was invaded. She fought to the end against hopeless odds until Hitler committed suicide and the armies surrendered. See *World War II.*

The Two Germanies. After the war Germany was divided into two parts: East Germany, which had been occupied by Russian armies, became a satellite of Russia; West Germany, which had been occupied by American, British, and French troops, became a federal republic in 1949. Under its first chancellor, Konrad Adenauer, West Germany became a member of NATO and a participant in the Common Market. Trade and industry grew at a phenomenal rate.

By 1955, all foreign controls were removed from West Germany except in West Berlin, where the new constitution was in abeyance. The Russians had tried to drive the western powers from the city in 1948–49 by cutting off supplies, the city being surrounded by East German territory, but a gigantic airlift defeated the move. Berlin remained an outpost of defense against Russia. Germans by the millions migrated to the west, the tide increasing after a revolt in 1953 was swiftly suppressed. Finally, in 1961, the East German government erected a wall between the two zones in Berlin.

Adenauer resigned in 1963, and was succeeded as chancellor by Ludwig Erhard, belonging to the same political party, the Christian Democrats. He had been economic minister under Adenauer and was given much of the credit for Germany's postwar economic resurgence. He looked to integration with other western powers as the best hope for eventual reunion with East Germany.

Erhard was succeeded in 1966 by Kurt Kiesinger, who moved to establish ties with Eastern Europe. During his term, U.S. and British troops in West Germany were reduced in number.

Willy Brandt, elected as West Germany's first Social Democrat chancellor in 1969, moved still further to close the gap between East and West, pursuing a policy of reconciliation with the Communist nations. He has been described as the first West German politician to accept the full consequences of Germany's defeat in World War II, and sought to shape a unifying course in the arena of European politics. For his efforts in the area of detente with Eastern Europe, Brandt received the 1971 Nobel Peace Prize. Throughout the next three years, his popularity declined somewhat as he faced multiple domestic and foreign policy problems. Then in 1974, a member of Brandt's personal staff, Günter Guillaume, was arrested as an agent for East Germany. The scandal forced Brandt's resignation. He was succeeded as chancellor by Helmut Schmidt, another leading Social Democrat.

NAME	LINEAGE	Period of Rule		Birth	Death
	CAROLINGIAN EMPERORS				
Louis the German	Son of Emperor Louis I. He is regarded as the founder of the German Empire. Kingdom divided on death of Louis the German.	A. D. 843	A. D. 876	A. D. 804?	A. D. 876
Charles the Fat	Son of Louis the German; sole king through death of his brothers, Carloman and Louis; crowned emperor 882	876	887	832	888
Arnulf of Carinthia	Illegitimate son of Carloman; elected by the nobles	887	899	850?	899
Louis the Child	Son of Emperor Arnulf	899	911	893	911
	HOUSE OF FRANCONIA				
Conrad I	Duke of Franconia, elected king of Germany	911	918	?	918
	HOUSE OF SAXONY				
Henry I, the Fowler	Son of the duke of Saxony	919	936	876	936
Otto the Great	Son of Henry I; crowned emperor 962	936	973	912	973
Otto II	Son of Otto I	973	983	955	983
Otto III	Son of Otto II	983	1002	980	1002
Henry II, the Saint	Son of Henry the Quarrelsome of Bavaria	1002	1024	972?	1024
	SALIAN OR FRANCONIAN EMPERORS				
Conrad II	Crowned emperor 1027	1024	1039	990?	1039
Henry III	Son of Conrad II	1039	1056	1017	1056
Henry IV	Son of Henry III	1056	1106	1050	1106
Henry V	Son of Henry IV	1106	1125	1081	1125
	HOUSE OF SAXONY				
Lothair II	Crowned emperor 1133	1125	1137	1060?	1137
	THE HOHENSTAUFENS				
Conrad III	Duke of Franconia	1138	1152	1093	1152
Frederick I, Barbarossa	Nephew of Conrad III; crowned emperor 1155	1152	1190	1121?	1190
Henry VI	Son of Frederick Barbarossa; crowned emperor 1191	1190	1197	1165	1197
Otto IV (Double Election)	Son of Henry the Lion; crowned emperor 1209	1198	1215	1174	1218
Philip of Swabia (Double Election)		1198	1208	1177?	1208
Frederick II	Son of Henry VI; crowned emperor 1220	1215	1250	1194	1250
Conrad IV	King of Germany, not emperor	1250	1254	1228	1254
An Interregnum		1254	1273		
	HOUSE OF HABSBURG				
Rudolf I	Son of Albert IV, count of Habsburg	1273	1291	1218	1291
	HOUSE OF NASSAU				
Adolphus	Elected king of Germany and deposed	1291	1298	1252?	1298
	HOUSE OF AUSTRIA				
Albert I	Eldest son of Rudolf I	1298	1308	1250?	1308
	HOUSE OF LUXEMBOURG				
Henry VII	Son of the count of Luxembourg, crowned emperor 1312	1308	1313	1262	1313
	HOUSE OF BAVARIA				
Louis IV (Double Election)	Son of the duke of Bavaria	1314	1347	1286?	1347
Frederick the Fair (Double Election)	Son of Albert I; minority choice	1314	1330	1286?	1330
	HOUSE OF LUXEMBOURG				
Charles IV	Son of John of Luxembourg; crowned emperor 1355	1347	1378	1316	1378
Wenceslas	Son of Charles IV; elected king of Romans 1376, deposed from German throne	1378	1400	1361	1419
	HOUSE OF PALATINATE				
Rupert	Elector of the Palatinate	1400	1410	1352	1410

GREECE

The history of Greece is the story of a group of tiny states which grew up as independent units and resisted to the end any plan of federation among themselves. Consequently, Greece never became a military power which could present a united front to the world, and her greatness did not lie in the field of political organization. Yet, despite the serious menace of foreign invaders and devastating wars between the states themselves, these states maintained their independence long enough to produce literature, philosophy, art, and architecture.

The Coming of the Hellenes. Greece was occupied by the Hellenes, an Indo-European people, at some time after 2000 B. C. They came as undeveloped tribes in search of homes, and immediately demolished an earlier civilization which had flourished in the prehistoric period, established themselves as masters of the entire peninsula, and made it their home henceforth, while the earlier occupants were entirely driven out or annihilated. This was probably accomplished by a gradual process covering several hundred years; for the Hellenic people comprised different groups, who may be supposed to have swept down into the peninsula in successive waves. These groups were closely related to one another but showed different characteristics. They were known in later times, when the Greeks were reconstructing their own ancient history, as Achæans, Æolians, Dorians, and Ionians, and, with the development of the Hellenic civilization, the special characteristics of each group produced a distinctive culture.

The Hellenes, thus established in a permanent home, began immediately to display the vigor and aggressiveness of a virile race. They soon spread over the neighboring islands of the Ægean, and then passed over these as by stepping-stones to the western coast of Asia Minor and to Crete. The sea was their highway and they became essentially a seafaring people. They developed a vigorous commerce and were ultimately competing for markets with the Phoenicians, whose powerful colony, Carthage, was dominant for a time in the West.

Greek Colonization. There followed a period of colonization which cannot be defined as to its beginning, but it was over by the end of the 6th century B. C. The colonies were founded as private enterprises by groups who were led to leave their native homes, sometimes through dissatisfaction with political conditions, sometimes through lack of land or by economic distress; they were not in the first instance commercial enterprises. The colonies thus established became independent units, but each maintained a close association with the mother state.

In this way colonies were sent to the shores of the Black Sea, to Egypt, to southern Italy, and to Sicily. A few of the important Greek colonies were: Byzantium (modern Constantinople), founded by Megarians in 660 B. C.; Naucratis, "Mistress of Ships," in Egypt, founded by Milesians about 640 B. C.; Cyrene on the northern coast of Africa, founded by Therans about ten years later; Syracuse in Sicily, founded by Corinthians in the 8th century B. C.; and Croton in southern Italy, founded by Achæans about 700 B. C. These and many other colonies were trading centers for Greek commerce.

The large cluster of colonies established in southern Italy gave a distinctive character to this district, which was called by the Romans *Magna Græcia*. This was to the Greeks a land of promise and opportunity such as the American "great West" has been. Here wealth was accumulated in great abundance, and the colony of Sybaris came to be spoken of as typifying extravagance and luxurious living. It was from these particular colonies that the first gleams of Greek culture began to reach the vigorous Roman people, and hence came the mellowing influence which was destined to make over the Roman character and bring about Rome's willing acknowledgment of the supremacy of Greece in the world of the spirit.

Greek Division and Unity. The segregation of the Greeks into tiny political units was brought about, first and chiefly, by the character of the people themselves and, secondly, by the nature of the country in which they settled. The Greek was by instinct strongly individualistic, thoroughly devoted to the interests of his family and immediate community, but inclined to be jealous and suspicious of those not so closely connected with him, even though they might be Greeks like himself. He was also ready to defend his own views, with prolonged argument if necessary, and unwilling to let any other man do his thinking for him. The land of Greece, on the other hand, with its endless succession of mountains and narrow valleys, each with a limited area of arable land, made isolation natural and easy, and strongly encouraged—indeed, almost made inevitable—the formation of small units which came to have a sense of independence and self-sufficiency.

Yet the centrifugal tendency was not the only one at work. The Greeks were led by a sort of national pride to designate all who were not Greeks as "barbarians," or people without the pale. This term was at first used without the reproach now attaching to the word, but it soon came to have a distinct suggestion of inferiority, and finally it indicated downright contempt. Then the songs of Homer, which were known and sung throughout Greece, strongly encouraged the same feeling; for in them the Greek states were represented as fighting together against

a foreign power. Furthermore, the religious worship of the Greeks was, broadly speaking, the same; and so they came together at stated intervals to honor special divinities in great festivals which assumed a national character. Such festivals were held at Olympia and at Nemea, in honor of Zeus, at Delphi, in honor of Apollo. and at the Isthmus, in honor of Poseidon. While these festivals were going on, it was customary to observe a religious truce throughout Greece. Mention may also be made of a council or league of several states in northern Greece, called the Amphictyonic League, which met primarily to discuss and settle questions pertaining to religious matters, and which naturally fostered a close bond of sympathy between all the participating states.

The City-State. The political unit throughout Greece was the *polis*, or "city-state," an independent organization composed usually of the inhabitants of a single small town. Occasionally, a town associated neighboring villages with itself in a small federation; this was done by Athens with the country villages of Attica, and by Sparta with those of Laconia. The population of these city-states was astonishingly small, and this characteristic remained one of the determining factors in Greek political development. The typical city-state of early times was ruled by a king, and this was doubtless the only form of government known in Greece during several centuries, after the tribal organization was outgrown and before the time when the record of Greek history commences, about the 8th century B. C.

At this time we find a state of political unrest prevalent throughout the land, for the reigning families were being overthrown in many of the states. The power was being taken over by small groups of nobles, or by individuals who succeeded for a time in getting sufficient support to maintain themselves supreme; in the former case the government came to be called an *oligarchy*, in the latter, a *tyranny*. Many of the tyrants were men of real ability and proved to be excellent rulers.

The spirit of political unrest, however, did not always lead to violence. In some states men of conspicuous wisdom and integrity were designated to draw up and codify a new system of laws. Such a service was rendered by Draco, and later by Solon, at Athens, and by Pittacus at Mytilene. This, of course, implies that writing was by this time in common use throughout Greece. The alphabet had been adopted from the Phœnicians at some time after 1000 B. C.

Government in Athens. The fortunes of the city-state of Athens may be considered typical of what was taking place throughout Greece prior to the end of the 6th century B. C. The early Athenian monarchy was gradually transformed into an aristarchy, which finally gave place to a pure democracy. This was accomplished as follows: First, the king's power was curtailed by the introduction of two new magistrates, the *polemarch* and the *archon*, elected by the people. Later, the kingship became elective, and six new magistrates were added, making the "nine archons." Meanwhile, unfavorable economic conditions were causing distress among the common people. The introduction of money to replace the old system of barter produced serious disturbance in the economic development of Athens, as it did in all Greece. The first coinage is said to have come into the Greek world from the wealthy kingdom of Lydia in Asia Minor in the 7th century B. C. This and other causes brought about a situation which demanded a remedy, and Draco was appointed an extraordinary legislator (*thesmothetes*) and commissioned to draw up a new code of laws. This he did in 621 B. C., but the penalties imposed by his laws for wrongdoing were so severe that it was found difficult to use his code; in later times an Athenian orator said that Draco's laws were written in blood, not in ink.

About thirty years later Solon was chosen to perfect the work of Draco. He undertook his task with a statesman's skill and was remarkably successful. By his social legislation he relieved the poor of their unbearable burdens, and by his political reforms he erected the framework of the Athenian democracy, making the people the sovereign power of the state, with complete control over all their executives, and giving all free men some degree of right as citizens.

The Athenian democracy, however, was not even yet fully established. Party strife continued, and Pisistratus, a popular and successful general, backed by the discontented element of the population, was able to grasp the supreme power. He proved himself a wise and able ruler; for he kept the form of the constitution laid down by Solon, while holding the guiding power in his own hands. The diversity and importance of the various enterprises carried on by Athens during his rule bear testimony to his tireless activity. Among these, may be mentioned the re-editing of the poems of Homer, the foundation of a huge temple of Olympian Zeus,—which had to await the wealth of a Roman emperor to bring it to completion,—the establishment of the great annual festival of "Dionysus in the City," in which tragedy, one of the richest fruits of the Greek genius, was performed, and the prosecution of successful military operations on the Hellespont.

The rule of Pisistratus was carried on by his sons after his death, until the tyranny was brought to an end, with the help of Sparta, in 510 B. C., and the descendants of Pisistratus were forever debarred by law from the rights of citizenship. Athens now began her career as a democracy, first modifying the constitution of Solon by the reforms of Cleisthenes, which provided for a new and more satisfactory grouping of the citizens.

Sparta and Other States. The other states had meanwhile been working out practicable constitutions, each in its own way. In contrast to the pure democracy finally achieved by Athens, a constitution of a strangely mixed character was adopted in Sparta. Here there were two hereditary kings, holding office for life, and a board of five ephors, elected annually; these ephors exercised most of the important civil functions which had belonged to the kings, and represented the common people as against the nobility. The senate or *Gerusia*, however, was composed of nobles and naturally represented the interests of that class. The Spartans had grown to be a conservative people devoted to a strict military discipline—in fact, a military state composed of a limited number of free warriors imposed upon a larger number of serfs or *helots*. The strictness of the Spartan discipline, which has become proverbial, did indeed produce a remarkably efficient corps of fighting men, but it repressed rather than encouraged the free development of the individual citizen.

Thus, by the end of the 6th century B. C., all the Greek states had passed through the period of political readjustment, and, temporarily at least, tyrannies were at an end. The period under discussion had witnessed notable achievement in many fields of activity. There had been great commercial expansion, as noted above, with marked progress in local industry, and real achievement in architecture and in literature. Indeed, the Greeks had by this time attained a high level of culture which marked them out as a peculiarly gifted people.

Religious Conceptions. The Greek had been wrestling also with the problems of life as expressed in his religion. The old anthropomorphic gods of Homer, whose writings were to the Greeks almost sacred, were little better than humans and had ceased to fulfill the ideal of an awakening age, and a more spiritual interpretation of godhead than that found in Homer was coming to be adopted by thoughtful men. Yet the outward form of the old polytheistic religion remained, with its temples, its priests, and its ritual worship.

A widespread yearning for immortality is evidenced by the prominence of societies which gave promise of this boon to mortals. The Eleusinian

Mysteries, a kind of Passion Play of the sorrows of Demeter, were open to all, even the humblest. Here great numbers found comfort in the hope of salvation and purification from the sins of the world. There was also the Orphic Sect, of widespread influence, and, in southern Italy, Pythagoras had founded his brotherhood.

On the other hand, many had been turning to seek a rationalistic explanation of the universe, as a protest against the mysticism of such bodies as the Orphic Sect. This movement grew up in Ionia in Asia Minor, and it was here that Greece was saved from the tyranny of religion interpreted by a priestly class. Beginning with crude speculations upon the nature of the material composition of the world, and progressing very slowly at first, a succession of serious and able men prepared the way for the great achievement of Greek philosophy in the 5th and the 4th century B. C. Thales, the pioneer of this movement, proposed that water is the primary element of all things.

Athens, Sparta, Thebes. At the beginning of the 5th century B. C., the important Greek states were related as follows: Sparta, with her wonderfully efficient army and her iron discipline, was unquestioned leader in the Peloponnesus, having come to overshadow Argos, whose ancient importance was waning. This pre-eminent position of Sparta placed her automatically at the head of a kind of league of Peloponnesian states. Even Athens, as we have seen, was indebted to Sparta for deliverance from her tyrants, and was for a time strongly under her influence. Athens, at the head of the federation of the villages of Attica, had outstripped her nearby rivals and held a secure and easily defended position as a sea power. The rival of Athens on the north was Thebes, the dominant power in Bœotia.

Persian Wars. At this time a new age dawned on Greece. The expanding Persian power was turning toward European conquest. Meanwhile the Athenians had sent aid to the Ionian cities in Asia Minor during a revolt against Persian rule. With this revolt crushed, Darius planned to punish Athens. His first expedition, in 492 B. C., was destroyed by storms, but two years later he sent a fleet and an army across the Ægean, which landed on the plain of Marathon, about twenty-five miles distant from Athens. His forces were guided by Hippias, son of Pisistratus, former tyrant of Athens. The Greeks, remembering the terrible Persian punishment of Asiatic cities, were panic-stricken. But Miltiades, who was familiar with Persian methods of warfare, roused their courage by his confident plans for meeting the invader, and under his leadership the Greek citizen-soldiers, with their spears, broke the attack of the Persian bowmen. The Persians fled, leaving 6000 dead on the field, while the Greek loss was only about 200. The grateful Athenians, who had borne the brunt of the battle almost without assistance, raised a memorial mound, which may still be seen on the field of Marathon.

Ten years passed, and Xerxes, son of Darius, in 480 B. C., entered Greece with an army of overwhelming size, accompanied by a great fleet. Sparta, on this occasion, stood solidly with Athens, and the Persian advance was opposed at strategic points on land and sea. Treachery, however, enabled Xerxes to enter by the pass of Thermopylæ—but only over the dead bodies of the heroic Leonidas and his loyal band of Spartans. Athens was burned. But the Athenians, wisely advised by Themistocles, had built a navy, and in the strait of Salamis they crushed the Persian fleet. The next year, 479 B. C., the remnant of Xerxes' army was defeated by the Greek spearmen at Platæa. Never again did a Persian army enter Greece. In the West also, the year 480 B. C. saw the Hellenic world freed from an Asiatic menace through the overwhelming defeat of the Carthaginians by the Greeks of Syracuse.

The generous co-operation of Athens and Sparta ceased, unfortunately, as soon as the danger was passed, and the old spirit of jealous rivalry again manifested itself. The Spartans looked with apprehension upon the energetic preparations of Athens to meet another possible emergency; sullen distrust and mutual suspicions prepared the way for the internecine struggle which was destined to ruin the fairest city of Greece.

The Athenian Empire. The Athenians, led by Themistocles, rebuilt their city with strong fortifications and improved and protected the harbor of the Piræus. Next, in order to secure complete protection against the menace of Persia, they organized the Confederacy of Delos, whose guiding spirit was Aristides, known as "The Just." This was a union of Athens with the Greek cities of Asia Minor and the Ægean islands and was at first a purely co-operative league. Its name arose from the fact that its treasury was located on the island of Delos under the protection of Apollo. The allies at first contributed ships, with which Cimon, son of Miltiades, freed the entire Asia Minor coast from Persian control, as far as the mouth of the Black Sea. Under his leadership, Athens gradually brought the states of the league into the position of dependencies, while maintaining friendship with Sparta. In 454 B. C. the transfer of the treasury to Athens marked the beginning of the Athenian "empire." But Cimon's policy of co-operation with Sparta was unpopular with the radical, democratic party at Athens, and he was ostracized.

At this period most of the offices of the Athenian democracy were filled by lot; hence the men selected were often inefficient. But the ten generals were elected by the votes of the people, an arrangement which gave a single powerful man his opportunity to direct the state. For about thirty years this position in the Athenian state was maintained by Pericles. His supremacy coincided with the most brilliant era of Athenian culture, though this period was marred by the first of those contests with Sparta which finally resulted in the complete ruin of Athenian political power.

The Periclean Age. Pericles' ambitious plan of establishing an Athenian land empire led to conflict with Sparta, and after years of fruitless struggle the so-called Thirty Years' Truce, in 445 B. C., restored the *status quo*. Both sides were exhausted. Meanwhile Athens had carried on a disastrous campaign against the Persians in Egypt. The next fifteen years in Athens are known as the Periclean age. Commerce brought the wealth of the world to the port of the Piræus. Tribute from allied and subject cities filled the public treasury. Rich citizens and the state lavished money without stint upon festivals and public buildings. Sculptors and architects of genius were employed to raise statues and temples in honor of the gods and of great men, and to express in marble the beauty and dignity of the human form. Contests and public prizes stimulated poets and dramatists. The democracy, by opening offices to all save the poorest citizens, encouraged a keen interest in politics. Schools flourished, oratory became a fine art, and the sophists, disturbers though they were, challenged the skill of the cleverest by the subtleties of their art of dialectics. Athens had become the center of Greek culture, and her influence extended far beyond the limits of Greece.

The Fall of Athens. But the other cities of Greece were jealous and hostile, and in 431 B. C. the truce of 445 B. C. was broken. The armies of Sparta, Thebes, and Corinth, with their allies, entered Attica and devastated the country about Athens. The people who were thus driven within the city were stricken with a plague due to crowded, unsanitary conditions. Pericles fell a victim to the disease, and Athens, lacking capable leadership, was thrown into confusion. The war continued for ten years. Athens managed to maintain control of the sea, and in 421 B. C. a truce of fifty years was arranged. But this peace failed to settle any real issue or to check the brutal passions that the war had aroused.

At this stage of affairs, Alcibiades, a high-spirited young man of remarkable ability, rose to power as champion of those opposed to the peace party in Athens. He incited the Athenians to undertake an expedition against the Corinthian city of Syracuse in Sicily, 415 B. C. But Alcibiades, who sailed as a general with the expedition, found himself recalled to Athens to answer a charge of impiety. He promptly deserted to Sparta. By his advice a Spartan general and a few troops were sent to Syracuse. The Athenian fleet and army were annihilated, 413 B. C., and the Spartans, who had been making annual invasions of Attica during the early years of the war, now definitely locked her within her walls by occupying the fortress of Decelea, a few miles to the north. For ten years the city held out, though forced to see her flourishing farms devastated and to import all supplies by sea. At length, in the battle of Ægospotami, 405 B. C., the entire Athenian fleet was captured or destroyed by the Spartans, and Athens, faced by starvation, surrendered. Her fortifications were leveled, and she was forced to recognize the supremacy of Sparta. After enduring a reign of terror carried out under Spartan protection, her democratic constitution was again restored, but her strength was broken.

Sparta and Thebes. There followed a dreary period of negotiations with Persia, both Athens and Sparta bidding in turn for an alliance which would gain the support of Persian gold. The King's Peace, 387 B. C., gave Greek leadership to Sparta. She had won her final battle with Athens by means of Persian funds, under the guise of champion of the free Greek cities. Now she revealed her purposes by overturning every democratic government and establishing in each state an oppressive and irresponsible Spartan governor supported by a garrison of Spartan soldiers. On a fateful night, a young Theban noble entered Thebes with a band of followers, killed the leaders of the oligarchic party, and forced the Spartan garrison to an ignominious surrender. Pelopidas and his friend, Epaminondas, thus challenged Sparta and made Thebes, for a few years, supreme in Greece. Epaminondas, who gave evidence of possessing a high type of statesmanship, was killed at the battle of Mantinea in 362 B. C.

It is worth noting that, even during the stress of her life-and-death struggle with Sparta, Athens had still been able to continue the work on the noble buildings which crown her acropolis. The shameless mismanagement of Athenian affairs after the death of Pericles had been subjected to the biting satire of Aristophanes, the dramatist, and the sophists had been ably and fearlessly met by the challenge of Socrates The story of the nations was being completed by Herodotus the very year in which Pericles succumbed to the plague, and Thucydides was engaged in setting forth in his history the lessons of the Greek wars while the greatest of them was actually in progress. In the years after the war, Plato, a pupil of Socrates, wrote of the ideal city-state, but he failed to see the larger problem of statesmanship, the union of cities. Isocrates, understanding the weakness of the Greek policies, pleaded for united action against the foreigner, and Xenophon endeavored to rouse Greek patriotism through his story of the Ten Thousand. But Greece was not to see political unity realized until her many quarreling states were welded into a dependency by the Macedonian power.

Alexander the Great. Macedonia, peopled by a race which was Greek in language as well as in blood, had been slowly assimilating the culture of its southern neighbors since the period of the Persian wars. In 360 B. C., Philip, a man of Greek education and military experience, came to the throne. He at once adopted a policy of Macedonian expansion. The battle of Chæronea in 338 B. C. gave him control of all Greece except Sparta. Death cut short his ambitious plan of invading Persia, but he left to his son Alexander a remarkable body of trained and devoted councilors and officers. Alexander, however, coming to the throne at the age of twenty, was soon to display a genius that outshone them all. He had been taught by Aristotle, who not only instructed him in history and science but also fired his imagination with the vision of a world empire resting on the firm basis of Greek culture and Greek traditions and headed by Macedonia.

In 334 B. C., after crushing a rebellion at Thebes, Alexander crossed the Hellespont and began the march which was to make his dream a reality. During the next twelve years he led his armies along the ancient highways of Asia, subjugating the cities which had been seats of civilization from hoary antiquity. He conquered Egypt, where he founded the great city of Alexandria, and penetrated the trackless desert as far as the shrine of Ammon, in order to win assurance from the god himself that he was, in very truth, son of Ammon; here he stood on the confines of the Carthaginian empire. His eastward march carried him into India, and only the restlessness of his army drew him back from the valley of the Ganges. In Babylon he made his capital with the magnificence of an Eastern potentate, and in that ancient city of the marshes, fever struck him down. He had brought Greek culture to the East; the Hellenistic age, which he ushered in, saw this culture thriving in many flourishing cities, from his own Alexandria in Egypt to the central plains of Asia.

The Greco-Roman World. But, if this age Hellenized the East, it also Orientalized the West. Oriental ideas of religion and statecraft found their way into the thinking and practice of the Greeks and of the Romans as well; for, although Alexander did not march into the West, Rome had long been under the spell of Greek influence. The religious cults of the Egyptian Isis and the Persian Mithra became widely popular in the Roman world, which was soon to include Greece among its provinces. Likewise, the Romans became acquainted with the notion of the divine character and right of kings, which may be traced to Alexander's practice of having himself proclaimed the son of Zeus. This may have seemed to him necessary in order to sustain his great authority, but it must be said that his assumption of divine right alienated loyal followers from him and, in the end, proved disastrous to his plans.

The death of Alexander destroyed the last hope of a unified Greek empire. Within a generation the vast realm he had conquered was divided among three of his generals. Macedonia and Greece fell to Antigonus; Syria, to Seleucus; and Egypt, to Ptolemy. One more attempt was made by a group of states in the Peloponnesus to assert Greek independence. But this Achæan League, as it was called, though led by able and patriotic men, was only partially and temporarily successful. For 150 years, under the Ptolemies, Alexandria was the center of that later widespread Greek civilization known as Hellenism. Here the Hebrew Old Testament was translated into Greek. The Museum of Alexandria was in effect a great state university. The schools of Alexandria were rivaled by those of Pergamum and of Rhodes; but it was an age of scholarship rather than of creative activity.

The strife and internal weakness of the Greek kingdoms left by Alexander gave Rome an opportunity to extend her power over all the East and to hammer the Greco-Roman world into a stable empire, a realm of Greek culture and Roman law.

Modern Greece. Greece was merged in the Eastern or Byzantine Empire when the Roman world was divided, and, after the fall of Constantinople in 1453, it became a part of the Turkish empire. From the 4th century B. C. until 1821, when the Greeks rose in revolt against the Turkish power, they were at no time a free people. During the 18th century an intellectual revival had taken place in Greece, and this had aroused national pride and brought about a restoration of the Greek language. This

revival of the national consciousness of Greece had stirred the interest of enlightened people in all the nations of the West. England, France, and Russia finally intervened; by the treaty of Adrianople in 1829 Greek independence was acknowledged by Turkey, and guaranteed by the three powers. In 1833 Otto of Bavaria became king.

Otto was deposed in 1862; in the next year a brother of the Danish king succeeded him as George I. In the same year a new constitution established a legislature, the *Boule*, elected by universal suffrage. In 1881 Greece gained Thessaly, but lost a part by the Turkish war of 1897. King George was assassinated in March 1913.

World Wars and After. At the outbreak of World War I, the Greek prime minister, Venizelos, supported the cause of the Allies against the wishes of King Constantine, whose sympathies favored Germany. Venizelos was compelled to resign, Oct. 7, 1915. In October of 1916 he set up a provisional government at Saloniki, which was recognized by the Allies. After great pressure on the part of the Allies, Constantine abdicated on June 11, 1917, and his son Alexander ascended the throne. Venizelos now brought Greece officially into the war on the side of the Allies. The Treaty of Sèvres, which was never fully ratified, gave to Greece important accessions of territory. Venizelos, however, defeated at the polls, left the country. On King Alexander's death, Constantine was recalled. This act estranged the Allies, who consented to a revision of the Treaty of Sèvres. Constantine took the field to enforce against the Turks the favorable arrangements previously agreed to, but was defeated.

Greece was obliged to sign the humiliating peace of Lausanne in 1923, by which Turkey recovered her control of Istanbul and the Anatolian coast of the Ægean. Over 1,500,000 Greeks were expelled from Turkey and settled in Greece. Constantine was forced to abdicate a second time. His successor, George II, was later compelled to leave the country and, on May 1, 1924, a republic was proclaimed. A royalist movement, however, slowly gathered force and, after a futile revolt led by Venizelos, it succeeded in re-establishing the monarchy in 1935. George II returned to the throne. The next year power was seized by a military group under John Metaxis. Greece was forced into World War II by an Italian attack in 1940. She was conquered by the Germans the next year and liberated by the British in 1944.

George II was recalled in 1946. Revolts broke out led by leftists and aided by neighboring Communist regimes. The Greek government faltered and Britain announced it could no longer help. Greece then appealed to the U.S. and Congress voted $250 million in aid. At the same time, Yugoslavia fell out with the Communist bloc and stopped infiltrating guerrillas into Greece. Order was soon re-established. George II was succeeded in 1947 by Paul I, who was followed by his son, Constantine II, in 1964.

In the 1960's Greece hovered on the verge of war with Turkey over control of Cyprus, whose Greek population wanted union with Greece. Constantine's reign was also marked by continuing internal crises and by 1968 he and Premier Papandreou were forced to flee by the military junta that seized control of the country and formed a new government and constitution. The Greek colonels who ran the country were headed by George Papadopoulos. Most civil liberties were suspended and thousands of dissidents were jailed. In June 1973, Papadopoulos abolished the monarchy and proclaimed himself head of a new Greek republic. In November, he was deposed by another military junta. Their rule lasted until the abortive attempt to topple Cyprian President Makarios in 1974. The debacle caused the military's downfall and former premier Constantine Caramanlis (1955–1963) returned from exile to head the country again. Elections in November made Caramanlis premier under a new constitution and rejected a reinstitution of the monarchy. In reaction to U.S. support of the fallen junta and the alleged U.S. favoritism toward Turkey, Greece dropped out of NATO in 1974.

GREENLAND

The discovery of Greenland is credited to the Norwegian, Eric the Red, who is said to have spent three years on the coast of the country (982–985). Within the next few years, several Norwegian settlements were made. These colonies had originally a republican organization but they fell under the authority of the Norwegian kings about the middle of the 13th century. Christianity had already been established about the year 1000. During the 15th and 16th centuries, Greenland disappeared from history, and, in 1585, the explorer John Davis found only Eskimos on the coast. After a lapse of 150 years, Hans Egede, a Norwegian clergyman, established a Lutheran mission settlement near Godthaab, under the authority of the king of Denmark. Greenland, like Iceland, was left in Danish hands at the separation of Norway and Denmark in 1814.

In consequence of the invasion of Denmark by Germany, the United States in 1941 assumed temporary control of Greenland to prevent any transfer or hostile use by the colony. In 1951 a Danish American agreement for the common defense of Greenland was concluded. Two years later Greenland was made an integral part of Denmark with the same rights of self-government with other divisions of the country.

Holland. See *Netherlands*.

HOLY ROMAN EMPIRE

The Roman Empire succeeded the republic and began its history with the rule of Augustus Cæsar in 29 B. C. After the death of Theodosius the Great in 395 A. D., the Western Roman Empire was separated from the Eastern, sometimes called the Byzantine, or Greek, Empire. The Eastern Roman Empire lasted until the fall of Constantinople in 1453 A. D.; the Western had come to an end as early as 476 A. D. In the year 800, Charlemagne at Rome inaugurated anew this Western empire as the Holy Roman Empire and was crowned as its first emperor by Leo III. After the extinction of the Carolingian line, there ensued a period of feudal disturbance, when the empire existed only in name. The title of emperor was, however, again given substance by Otto I, king of the East Franks. At the invitation of the pope, he entered Italy with his victorious armies, and at Rome in 962 was crowned emperor. In the reign of Henry IV (1056–1106) began the momentous contest for supremacy between the emperors and the popes.

On the death of Henry V in 1125, the imperial office became elective, the first elected emperor being Lothair II. In 1356, the emperor Charles IV promulgated the Golden Bull, which determined the imperial electors.

In 1273 Rudolf, the first emperor of the house of Habsburg, was elected, and from 1438 the succeeding emperors belonged to this house. Not until 1806, when the Empire was broken up by Napoleon, did Francis II relinquish his title as emperor of the Holy Roman Empire. See *Austria*, *Italy*, *Spain*.

HUNGARY

The Magyars, an Asiatic people of Turanian race, allied to the Finns and the Turks, dwelt in what is now southern Russia before they descended, under Arpád, into the plain of the Danube, toward the end of the 9th century, and conquered the whole of Hungary and Transylvania. During the first half of the 10th century their invasions and incursions spread terror throughout Germany, France, and Italy; but at length their total defeat by Otto I of Germany put an end to their maraudings, and under their native Arpád dynasty they settled down to learn agriculture and the arts

of peace. Stephen I (997–1038) was the first who was successful in extending Christianity generally among the Hungarians; and he was rewarded with a crown from Pope Sylvester II and the title "apostolic king" (1000). Stephen encouraged learning and literature, and under him Latin became the official language of the government.

About the end of the 11th century the boundaries of Hungary were extended by the conquest of Croatia, Slavonia, and Dalmatia. In the 12th century the Hungarians first attained, through French connections, a certain refinement of life and manners. About the middle of the 13th century, King Bela induced many Germans to settle in the country, which had been depopulated by Mongol invasions. With Andrew III (1290–1301) the male line of the Arpád dynasty ceased, and the sovereignty now became dependent upon an electorate. Charles Robert of Anjou was the first to be thus chosen (1309). Louis I (1342–82) added Poland, Red Russia, Moldavia, and a part of Serbia to his kingdom.

Decline of the Kingdom. From the accession of Sigismund, elected emperor of the Holy Roman Empire, dates the beginning of the decline of Hungary. His reign (1387–1437) was marked by the Turkish invasion and the Hussite war. He nevertheless introduced various reforms and founded an academy at Buda. Matthias Corvinus (1458–90), surnamed the Great, combining the talents of diplomatist and general, proved successful against his enemies at home and abroad. He was an ardent patron of learning, and he founded a university at Pest.

During the early 16th century, domestic troubles and the rapacity of the magnates brought the power of Hungary to a low pass, and the battle of Mohács (1526) reduced a part of the country to a Turkish province. The rest was left to the opposing claims of Ferdinand of Austria and John Zapolya. Eventually, with the aid of the Protestants, the quarrel was settled in favor of Ferdinand, who was proclaimed king of Hungary. In 1687 the sovereignty was made hereditary and remained until 1918 under the scepter of the Habsburgs. In 1686 Leopold I took Buda and recovered most of Hungary and Transylvania from the Turks. In 1723 Charles VI, by a decree known as the Pragmatic Sanction, secured from his several hereditary states their promise of allegiance at his death to his daughter, Maria Theresa. In this way the Hungarian crown passed to the female descendants of the house of Habsburg. Charles died in 1740, and the loyalty of the Hungarians to his daughter was at once proved by the support they gave her in her struggle against the encroachments of Frederick of Prussia and the insidious designs of France.

Movement for Independence. Despite the War of the Austrian Succession, Maria Theresa did much for the improvement of Hungary, particularly in the founding of schools and colleges. Her son and successor, Joseph II (1780–90), tried to break down all the ancient Magyar institutions of self-government. Opposition to this policy was increased by his edict of 1784, making German the official language. However, on the advent of the French Revolution and during the wars that ensued, the Hungarians once more played a prominent part in support of the Habsburg crown. Leopold II (1790–92) had revived the power of the Hungarian diet. But the Revolution had given an impetus to ideas of national and popular rights, which the Hungarians, long stifled under the Germanic traditions and tendencies of their rulers, were among the first to feel. For a time, Francis I and Metternich stood stiffly out against all concessions, and tried to govern by pure absolutism, but they ended by summoning a new diet in 1823, controlled by Magyars.

Successive diets made new demands for religious equality, suffrage, and abolition of privileges. The Austrian government responded by imprisoning Deak, Kossuth, and other leaders, but the diet of 1839 forced their release and other concessions. The revolution of 1848 in Austria drove out Metternich and gave new force to the Magyar struggle.

The Dual Empire. Prince Metternich fled to London and the court at Vienna made concessions but planned reprisals. In December 1848 the Austrian army, reinforced by the Slav dependencies of Austria, renewed the war. The Hungarians held their own, and the Austrians, in despair, called on Russia for assistance. The Hungarian revolt was cruelly suppressed, but a constitutional agitation continued, and, after her defeat at Sadowa, in 1866, Austria, facing a nation as strong as herself, was compelled to make terms. In 1867 Hungary became an equal partner in the empire; the emperor and empress were crowned king and queen of Hungary.

The dualism of the Austrian empire was thus finally constituted. But Hungary itself was made up of people of several races, the Slavs constituting more than half of the population, although the Magyars, or rather the Magyar nobles, alone held political power. About 1875 this ruling class began a policy of "Magyarizing" the entire state through manipulating the suffrage laws and insisting on the universal use of the Magyar language. Until the outbreak of World War I, this policy was a source of increasing bitterness among the Hungarians.

Hungary in the World Wars. At the opening of World War I Hungary followed Austria and Germany. In the collapse of 1918 the Slav population went to the new states, Czechoslovakia and Yugoslavia; the Rumanians, with over a million Magyars, to an enlarged Rumania; leaving Hungary practically a Magyar state, with about half its former area.

In November 1918, Hungary proclaimed the Hungarian People's Republic, with Count Karolyi as provisional president. This government lasted until March 1919, when a soviet administration, under Bela Kun, was set up. A socialist government succeeded the soviet, and after an interim of seven months, Admiral Nicholas Horthy was elected regent, March 1, 1920, by the National Assembly. A "party of Unity," under Stephen Bethlen, succeeded in stabilizing the political situation. In 1921 Charles IV, former emperor of Austria and king of Hungary, attempted unsuccessfully to regain the throne.

In World War II Hungary was forced to side with the Axis powers. She recovered some of her territory, lost to Rumania and Yugoslavia, joined Germany in her wars against Yugoslavia and Russia, and declared war against the United States, December 13, 1941. Upon invasion by the Russians in 1944, her government was taken over by the Germans, but Russia occupied the country. A provisional anti-German government made an armistice with Russia. A republic was established November 1, 1945, after elections which had given a majority to a non-Communist Small Land Owners party. Under Communist pressure the economic situation grew steadily worse, and inflation ran rife. Hungary signed a peace treaty, prepared by the Allies, in February 1947.

In May the Communists holding key positions in the ministry discovered a "conspiracy against the government," implicating the leaders of the Small Land Owners party. The premier, Ferenc Nagy, was forced to resign. With Russian connivance and support, a Soviet regime was set up. February 1, 1949, Hungary was declared a "People's Republic." In 1956 a popular revolt against the government flared into revolution, which was suppressed with the aid of Russian tanks and troops. Russian control was further evidenced by Hungary's execution of former premier Nagy and other patriots, announced in 1958. The Soviets placed Janos Kadar at the head of the party. Although loyal to the U.S.S.R., his regime cautiously liberalized social and economic life in Hungary. Under a new economic plan introduced in 1968, Hungary has become much more consumer-oriented than other Eastern European countries.

ICELAND

Though the Culdees, an ancient order of Irish monks, are said to have settled in Iceland as early as 795 A. D., it was not until between 870 and 930 that Iceland was discovered and colonized by the Norsemen or Scandinavian vikings. The earliest immigrants came in three successive movements,—from Norway, then from the Norse kingdom of Dublin, the Orkneys, and the Hebrides, and, latest, again from the kingdom of Norway. Christianity established itself about the year 1000.

In the beginning the government of Iceland was a species of aristocratic republic made up of small landowners whose laws were framed and sanctioned by a national assembly called the *Althing*, which met once a year in summer time. But, between the years 1262 and 1271, a period of internecine strife brought the island under the sway of the Norwegian kings. From 1280, Iceland, through the union of the Scandinavian crowns, became a dependency of the Danish crown, though it was not until 1381 that it was constituted such by law.

This medieval period under foreign rule saw a sad decline in the spirit and enterprise of the Icelandic people. The Black Plague decimated the population. Ancient arts and crafts perished, and song and story languished. The Reformation kindled anew the intellectual life of the country, but this wrought little change in the economic state of the people. Moreover, throughout the 16th and 17th centuries the island was the prey of pirates and buccaneers. In the 18th century plagues of smallpox, famines, and volcanic eruptions caused the death of about a fourth of the population.

When Norway was separated from Denmark in 1814, Iceland remained a dependency of the latter kingdom, but eventually was granted home rule and virtual independence. On Germany's invasion of Denmark in 1940, the Icelandic parliament took charge, and, in 1944, Iceland, again a republic, formally separated from Denmark. For protection, Iceland has permitted U.S. troop bases, despite vigorous protests from the Soviet government.

INDONESIA

The former Netherlands East Indies, a part of the Malay archipelago, including the islands of Java, Sumatra, Borneo, Celebes, and many others, became the United States of Indonesia, December 28, 1949.

Two-thirds of the population is centered in Java. The first Europeans to settle in Java were the Portuguese in 1511. They were driven out by the British and Dutch in 1595. Then the Dutch evicted the British. The Dutch East India Company, organized in 1602, conquered the islands, and governed them until the Company was dissolved in 1798. From 1916 until the Japanese conquest in 1942 the islands were ruled by the Netherlands home government. Following the Japanese surrender in 1945, the Dutch returned, but the Indonesians declared their independence, and for more than four years there was recurrent fighting between Dutch and Indonesian forces. Finally, at a conference held at the Hague in November 1949, it was agreed that complete sovereignty should be transferred to the Republic of Indonesia. Indonesia's self-chosen president, Sukarno, issued a decree in 1960 enabling him to control the political parties.

Under his rule, the economy drifted into disorder but was saved by massive aid from the United States and Russia. In 1965, leftist groups attempted a coup, but it was put down by military forces under the leadership of General Suharto. The subsequent purge of Communists left thousands dead. Suharto became president in 1968 and was reelected, running unopposed, in 1973.

IRAQ

Modern Iraq covers approximately the territory of ancient Mesopotamia. The ancient name means "between the rivers" of the Euphrates and Tigris. Mesopotamia, "the cradle of civilization," was the site of mankind's earliest civilization. Here were invented the first form of writing (cuneiform script) going back beyond 3500 B.C., the wheel, the division of the day into twelfths, the earliest irrigation works, the smelting of iron, and the development of astronomy and mathematics. These inventions followed the so-called agricultural revolution, which is placed at least as early as 7000 B.C., and the political development which was thereby made possible.

The earliest known inhabitants were the Sumerians. The country was conquered successively by the Amurru, the Akkadians, the Kossites, the Hittites, the Babylonians, and the Assyrians. Later came the Persians, Greeks, Romans, Parthians, and the Sassanids, the last named ruling from 226 to 637 A.D., when the Arabs conquered the country. Their capital, Baghdad, founded in 762, became the world's chief center of learning and art. In 1259, the Mongolian prince Jenghis Khan utterly destroyed Baghdad and ruined the canal system. The country lay a desert for nearly 700 years.

The British army occupied Mesopotamia in World War I and set up a state called Iraq, which was declared a British mandate by the League of Nations. Iraq promptly revolted and set up a monarchy with Faisal I as the first king. In 1945, Iraq joined the Arab League of Egypt's Nasser, but withdrew in 1958 after a revolution in which the king, Faisal II, was killed. A republic was declared. First aligned with the western powers, Iraq later accepted arms from Russia. It discussed political union with Egypt and Syria, but the proposals failed. Various coups followed. Then, in 1968, Gen. Ahmed Hassan al-Bakr took power along with the councils of the leftist, nationalistic Baath party, which established a police state.

The year 1925 was a landmark in Iraq's history. Oil was discovered that year, and Iraq became one of the world's leading producers of oil. The revenues were applied toward modernization and also to build irrigation works.

IRELAND

The early history of Ireland rests on narrative songs entirely oral until the middle of the 7th century A.D. The story teller (*fili*) held a position of high honor, having received long training and being customarily in the pay of the kings and nobles.

Before the Christian era, Ireland was divided into five kingdoms, or "fifths," and later into seven, sometimes called the heptarchy. Petty kings owed fealty to the seven kings, and they in turn owed fealty to a high king. This feudal organization differed from that on the European continent in that subordinates were less easily replaced, their power being based on family descent and the loyalty of their followers.

Christianity and St. Patrick. Although there were a few Christian societies in Ireland before 432 A.D., when St. Patrick was sent there by Pope Celestine, St. Patrick was the founder of Christianity in the island. He organized these communities and converted most of the rest, having won the protection of the high king Tara. Schools and monasteries were founded. In the next three centuries, Latin manuscripts were copied and illustrated, scholars from abroad studied in Ireland, and Irish missionaries spread Christianity in England and every land in Europe.

Invasion of the Danes. But the progress of civilization was checked at the close of the 8th century by the invasions of the Danes, who left destruction and ruin behind them wherever they went. After 200 years of this marauding, the Danes were completely overthrown in 1014 at the battle of Clontarf by Brian Boroihme, who paid the price of victory with his life.

Anglo-Norman Period. Henry II was the first English king to attempt to control Ireland. Beginning in 1172 he invaded the land and for two centuries the Irish were subjected to almost constant plunder and persecution. The next century saw the conquest by the Irish of their conquerors. The descendants of the Anglo-Norman knights who ruled in Erin became more Irish than the Irish themselves and English influence by the dawn of the 16th century seemed on the wane.

The Tudor Period. Trouble began again when Henry VIII repudiated the authority of the papacy. The clergy and people of Ireland could not be won from Rome. Immense properties of the Church were confiscated, much of it given to the nobles to pay them for their allegiance to the English crown. Queen Mary began the practice, continued by the later Tudor rulers, of driving out the Irish to provide land for English colonization.

In the reign of Elizabeth, a series of rebellions took place under Shawn O'Neill, Desmond, and Hugh O'Neill, earl of Tyrone. After ten years' fighting, Hugh O'Neill was defeated in 1603, and the whole of the island passed into the hands of the English. No less than 600,000 acres of land belonging to Irish chieftains were divided among English colonists.

The Stuarts and Cromwell. James I, the first Stuart king (1603–25), continued the policy of confiscation, making Ulster County a home for Protestant settlers and permanently dividing the country religiously. Under Charles I, continued confiscation resulted in another general rising, called by the British "the massacre of 1641," when thousands of the new settlers lost their lives.

In 1649 Cromwell landed with 10,000 troops and quelled all rebellion. At Drogheda, he put to the sword 2000 Irish soldiers who formed the garrison. It has been said that 20,000 Irish were deported and 40,000 fled the country. Under Charles II confiscations ceased and some 600 land owners had their lands restored.

William of Orange. In the English revolution of 1688, the Catholics of Ireland rallied to the side of James II, while the Protestants supported William of Orange. William crossed over to Ireland in 1689 and defeated the Irish forces under James at the battle of the Boyne. The English Parliament decreed that one million acres of land should be divided among the Protestants. All Irish trade with the English colonies was prohibited, and commerce and industries, including the great woolen trade which had been built up by Irish Protestants, were crushed. Thus it was that the best elements of the country were forced to emigrate.

The Act of Union. The British government under Pitt now decided to unite the English and Irish parliaments. To effect this, $8 million was spent in bribing and in buying up the petty boroughs which held the majority of the seats in the Irish House of Commons. The Act of Union was accordingly proclaimed in 1801.

George III refused to sign a measure introduced by Pitt to emancipate the Catholics of Ireland; thereupon the Catholic Association was inaugurated and, under the leadership of O'Connell, forced the government to bring in an emancipation bill which received the assent of George IV on the 13th of April, 1829. Following this victory, O'Connell founded an association for the repeal of the Union. The government, fearing sedition, suppressed the association.

In 1847–48 Ireland was stricken by an appalling famine due to the failure of the potato crop. The British government distributed relief but on a piteously inadequate scale. It is estimated that over 1,500,000 persons died of starvation, while another 1,000,000 emigrated, chiefly to Canada and the United States.

In 1864 a conspiracy originating with the Fenians, having as its object the separation of England and Ireland, was discovered and likewise suppressed by the British government.

From this time onward there were two views taken among British politicians regarding Ireland, one favoring coercion, the other supporting a policy of conciliation. Gladstone, in 1869, disestablished the Protestant Episcopal Church of Ireland, but he was unable to carry the whole of the Liberal party with him on his Home Rule bill of 1886. Again, in 1892, with a small majority of forty, he failed to force his second Home Rule bill through an antagonistic House of Lords.

In August 1914, World War I broke out. Asquith was now prime minister. He had been elected on a Home Rule platform and had succeeded in placing his Home Rule bill on the statute book. But Ulster had to be reckoned with. Four of the Ulster counties opposed the Act and threatened armed resistance. The government, thus intimidated, showed signs of vacillation, and it was arranged that the act should not come into force until the termination of the war.

Sinn Fein's Proclamation. Meanwhile, two great forces had long been silently leavening the life of the Irish people socially and intellectually. One of these forces was the Gaelic League, whose main object was the rejuvenation of the national language and the popularizing of all things Gaelic. The other was that of Sinn Fein (*shĭn fān*), a revolutionary society of young Irish intellectuals. The Sinn Fein, in Easter week of 1916, rose in rebellion against England and proclaimed Ireland a republic.

Irish Free State. After a week of fighting in Dublin, the republican army was defeated. The Sinn Fein party turned to guerrilla tactics and terrorism; it and its opponents, the Black and Tans, chiefly from Northern Ireland, engaged for over two years in an undeclared civil war. At the general election of 1918, the Sinn Fein party swept the country and set up a parliament (Dail Eireann), declared to be for all of Ireland. At length a truce was declared and the British government, on December 6, 1921, signed a treaty in which Ireland, exclusive of Ulster, was given the status of a free state in the British Commonwealth. Northern Ireland had already been given a parliament but remained an integral part of the United Kingdom of Great Britain and Northern Ireland.

Eamon De Valera, who had been president of the de facto republic, would not accept the treaty. He placed himself at the head of the extremists and waged a civil war against the constitutional party, which lasted until 1923. By 1924, political prisoners were released, and the government, headed by Cosgrave, made marked progress toward a better day. The process of land distribution, begun in 1870 by the British government, was completed in 1931.

End of British Tie. The election of 1932 brought De Valera to power as president. His first moves were to abolish the oath of allegiance to the sovereign of the Commonwealth and refuse to continue payments due to Great Britain for land purchases made by it. Tariff war followed. Ensuing economic stress and internal dissention led to a gradual abandonment of this policy.

In the election of 1937, De Valera was returned to power as prime minister. By the same election, he secured a new constitution declaring the country an independent republic under the Irish name of Eire. During World War II, Eire remained neutral. After the war, in 1949, it withdrew from the Commonwealth, although not under the leadership of De Valera, who had been defeated in the elections of 1948. He served again as prime minister, however, in 1951–53 and 1957–59. He had the Sinn Fein organization outlawed when it advocated direct

action to take over Northern Ireland, and interned members who resisted. He was elected president in 1959 for a seven-year term. During the 1960's, substantial progress was made toward industrialization for the first time in Ireland's long history. Eire supplied troops to the United Nations for several police actions, including the Congo.

Israel. See *Palestine.*

ITALY

The history of ancient Italy is the story of Rome down to 476, when Odoacer, the strongest of the German generals in Italy, having deposed the boy-emperor Romulus Augustulus, made himself master of the western half of the Roman Empire. In 493, however, he was overthrown by Theodoric, leader of the invading Ostrogoths (East Goths), a powerful and able man who established himself as king and ruled until his death in 526. The strong and statesmanlike policy of Theodoric seemed to promise order and the preservation of the remnants of ancient Italian civilization. But, just after his death, Justinian succeeded to the throne of the Eastern Empire, and he sent his general, Belisarius, to conquer the Goths. They were so completely defeated that they withdrew from Italy.

The Lombard Supremacy. After the death of Justinian (565), his successors at Constantinople were unable effectively to protect their reconquest of the Western Empire. In 568 they lost a great part of it to the invading Lombards, who poured from the north over the Alps into the plain of northern Italy, which still bears the name of Lombardy. Originating from near the Baltic, these barbarians, unlike the Ostrogoths, had had little intercourse with the Empire and were consequently far less civilized. Their leader, Alboin, who came to a violent end in 573, was in no way comparable to Theodoric. Though the Lombards overran the North and strips of territory down the center of Italy without meeting serious resistance, they lacked military and administrative capacity to complete the conquest of the peninsula. Their kingdom, which endured two centuries (568-774), consisted of a loose confederation of over thirty duchies which the central authority at Pavia was too weak to weld together.

The period of the Lombard domination is noteworthy for the rise of the power of the papacy, especially in the time of Gregory the Great, bishop of Rome from 590 to 604, under whom was begun the conversion of the heathen Germanic tribes who had conquered Britain. The term "pope" (father), formerly the title of every Christian bishop, came to be applied exclusively to the successor of St. Peter; and as the bond between Rome and the Eastern Empire gradually weakened, the people of Rome came to look for protection more and more to the pope as their temporal as well as spiritual ruler.

The final rupture between Constantinople and Rome occurred following a rebellion in Italy, supported by the pope, against the image-breaking decree promulgated by the emperor Leo III in 726. In this strife the Lombards intervened in the hope of completing their conquest of Italy. They captured Ravenna and the coast cities that had been held by the Eastern Empire, and threatened Rome; but their king, Liutprand, out of deference to Pope Gregory II, desisted from an attempt on the city, and even presented the pope with some conquered towns, thus laying the foundation of papal temporal sovereignty.

Overthrow of the Lombards. From this time on, the popes worked steadily and successfully to undermine the Lombard power. In 754, ten years after Liutprand's death, Pope Stephen II crossed the Alps and appealed in person to Pepin, the first king of the Franks of the Carolingian line, for aid against the Lombard king, Aistulf, who was threatening Rome. In requital for being anointed king of the Franks by the pope, Pepin twice made war on Aistulf, forcing him to surrender his conquest of the same coast cities that had been taken 26 years before by Liutprand, and handing them over to the pope.

Twenty years later, Pepin's son Charles, known to history as Charlemagne, for a personal grudge against Desiderius, then king of the Lombards and his own father-in-law, and in response to an appeal from the pope, led his army into Italy and made an end of the Lombard rule. In view of his great power in Italy, Gaul, and Germany, it seemed very natural and wise that the pope, on Christmas Day in the year 800, should crown him emperor of the Romans. This act, however, was to bring Italy little good, as it was the origin of frequent and far-reaching struggles between emperors and popes over supremacy of authority. For a time Italy found herself in close relationship with northern Europe, but the Treaty of Mersen in 870 established her once more as the Kingdom of Italy, and for many centuries this ancient land, the center of the Christian Church, was the battle-ground of her own jealous cities and of contending foreign armies. Southern Italy and Sicily were overrun by the Byzantines, Lombards, and Saracens, until the Normans drove them out in the 11th century and established the rich and strong Kingdom of the Two Sicilies.

In 962 Otto the Great, who had subdued the rebellious Lombards in the North, was crowned emperor, and later the rise of the Norman power in the South, the strengthening of the papal states, and the growth of the city-states, such as Florence and Venice, practically displaced the imperial authority. The northern Italian cities formed the Lombard League and successfully opposed the attempts of Emperor Frederick Barbarossa (reigned 1152-90) to establish his authority over their local affairs.

Italian City-States. These Italian cities were usually governed by an oligarchy composed of the wealthier citizens. They were continually at war with each other. But, in spite of all their disorder, they grew rich and powerful. Venice and Florence achieved rank among the important states of Europe. In the 14th and the 15th century, Italian cities became the centers of the revival of art and learning known as the Renaissance.

At the beginning of the 14th century the kingdom of Naples occupied southern Italy, the papal states extended in a diagonal band across the center of the peninsula, and the North was divided among the city-states. The greatest of these were Venice and Florence. Most of the cities fell at one time or another into the control of despots. Venice was a city of merchants, ruled by an aristocracy; Florence was a republic, but its government came to be directed by the family of the Medici. Rome was governed by the popes, and after the return of the papacy from Avignon (1417) they rebuilt the city and employed the greatest artists and architects of the time to adorn their capital with splendid buildings, paintings, and sculptures.

Period of Foreign Rule. The latter years of the 15th century mark the beginning of the long series of struggles of France, Spain, and Germany in the peninsula. Naples and Sicily were in the hands of the Spanish kings of Aragon. Charles VIII of France determined to seize the Spanish territory and, if possible, unite Italy under his authority. But, after a campaign in which he lost but one battle, he was compelled to withdraw. His successors, Louis XII and Francis I, endeavored to extend the French power in Italy, and protracted warfare ensued, especially between Francis I and the emperor Charles V, in which Francis I was repeatedly worsted. By the Peace of Cambrai in 1529 the Habsburgs secured a grip upon Italy that was not broken until the establishment of the Kingdom of Italy in the 19th century. The most important result of these campaigns, however, was the revelation of the treasures of Italian learning and art to the northern nations.

In the course of the struggle between France and Austria in the 17th century and the early part of the 18th, the house of Savoy secured Sardinia, and the

duke of Savoy took the title of king of Sardinia. From the growth of this power in Piedmont sprang the modern national strength of Italy.

Napoleon in Italy. After the French Revolution, the French armies entered Italy and drove the Austrians out of the North, leaving them, however, in possession of Venice, where the ancient republican government was destroyed. The French set up the Cisalpine, Ligurian, Roman, and Parthenopean republics. But the democratic movements which were thus encouraged received sharp repression from Napoleon when he was firmly in power. He took for himself the iron crown of Lombardy and gave Naples to his brother Joseph and later to Joachim Murat. Rome became part of the French Empire. After the fall of Napoleon, the Congress of Vienna restored, with few changes, the 18th century order.

Struggle for Italian Freedom. The despotisms maintained in Italy by Austria and the Holy Alliance met with continued opposition from patriotic Italians. The ideal of a unified and independent Italy gained more and more adherents. The strong movement toward the realization of this ideal began in 1831, when Charles Albert, King of Sardinia, began steps to liberate Italy. Pope Pius IX introduced reforms in the papal states, and several other states secured constitutions in 1848. Failing in a campaign against the Austrians in Lombardy, Charles Albert abdicated in favor of his son, Victor Emmanuel II. Meanwhile, the people of Rome, led by Mazzini and Garibaldi, had abolished the temporal rule of the pope and set up a republic. This was overthrown by the French. The kingdom of Sardinia, now under a liberal constitution, became the rallying point for the party of United Italy. The statesmanship of Cavour (1810–61), the prime minister of Sardinia, secured attention to the claims of Italy in the Congress of Paris in 1856.

In 1858 Cavour secured the aid of Napoleon III in an attempt to drive the Austrians from Lombardy. After the victories of Magenta and Solferino (1859), Napoleon suddenly weakened and signed the preliminary treaty of Villafranca. However, in spite of Napoleon's lapse, Piedmont had acquired Lombardy. Soon the duchies of Tuscany, Parma, and Modena, and the papal state of Romagna united with Piedmont. On April 2, 1860 a parliament of the enlarged kingdom met at Turin.

On May 5, 1860 Garibaldi, whose name was worth an army, embarked from Genoa with a thousand men for the conquest of Sicily and Naples. This was one of the most audacious and brilliant exploits of modern history. On September 6 Garibaldi, with a few companions, entered Naples by rail. The king had fled. Victor Emmanuel entered the city on Nov. 7. On the 18th of February 1861 a parliament representing all Italy, except Venetia and Rome, met at Turin, and the title of king of Italy was bestowed on Victor Emmanuel. Austria, crippled by her disastrous war with Prussia in 1866, was forced to yield Venice to Italy in that year, and when, in 1870, the French, at war with Prussia, withdrew their garrison from Rome, the sole support of the temporal rule of the popes was gone, and Italy could at last claim the Eternal City for her capital.

The Kingdom of United Italy. Many serious problems confronted the new state. The people, more than 75 per cent of whom were illiterate, had to be educated. A compulsory education law was passed in 1877, and since that time the percentage of illiteracy has been largely reduced. In 1881 and again in 1912 the suffrage was greatly extended; in 1920 it was made universal for men and women. Relations with the pope were difficult. The Law of Papal Guarantees, passed in 1871, gave the pope sovereignty over certain parts of the city of Rome and an annual grant of money. This arrangement was never accepted by the pope in its original form. In 1882 Italy joined the Triple Alliance.

In 1885 Italy embarked upon a colonial policy and became involved in a disastrous war with Abyssinia. Popular discontent increased under heavy taxation. In July 1900 King Humbert was assassinated; Victor Emmanuel III succeeded.

Great increase of population and consequent emigration to other countries turned the attention of the Italian government to the acquisition of colonies. In 1912, after a war with Turkey, Italy acquired Tripoli and twelve Ægean islands. She long looked upon the region around the city of Trent, Trieste, and Istria as properly Italian territory, *Italia Irredenta*, or "unredeemed Italy." On the outbreak of World War I, Italy remained neutral until May 1915, when she entered the war on the side of the Allies. By the Treaty of St. Germain her territory was greatly enlarged at the expense of Austria.

Fascist Rule. The years 1920-21 were marked by conflicts between communist and nationalist groups. The latter, known as Fascisti, seized power in 1922, under the leadership of Benito Mussolini.

Dictatorial power was conferred on Mussolini. He established a form of modified capitalism which he described as a corporative state, Fascism. Mussolini made peace with the Vatican in 1929, yielding to the papacy the sovereignty over Vatican City.

In 1935–36 Italy conquered Ethiopia, in defiance of League of Nations sanctions, and assisted the insurgents in the Spanish civil war, 1936–39.

Before World War II, Mussolini made an alliance with Hitler's Germany. After Germany had conquered France, he brought Italy into the war to join in what he thought was the kill. But it turned out otherwise. See *World War II*.

The Republic. When the allies entered Rome, the king retired and formally abdicated in May 1946. In a popular referendum, held in June, 54 per cent of the people voted for a republic, which came into effect by a new constitution in 1948.

After World War II, Italy was plagued by unemployment and civil dissension. The Communist party tried to win power but, under the influence of the Vatican and the U.S., the country turned to the West and joined NATO. In 1957, it became a member of the European Common Market.

Mariano Rumor became premier in 1968, succeeding Aldo Moro. Student strikes, civil disturbances, and a series of government crises, often concerning factional fighting between the Socialists and the Christian Democrats over the status of the Communist party, brought the collapse of the Rumor government. Emilio Colombo, sworn in in 1970, promptly began a program of anti-inflation measures and social reforms to aid Italy's threatened economy. Succeeding governments of Giulio Andreotti, Rumor, and Moro failed to meet the growing economic and political crises. In the 1976 national elections, the Communist party made wide gains. No majority existed in parliament, so Andreotti formed a weak minority government while Communists headed many of the legislative committees. By August of 1976, the Communist party controlled the local government of every major Italian city.

JAPAN

Early Japanese history is interwoven with myths and legends. Tradition says that Jimmu Tenno set up his government near the present Kyoto in 660 B. C. Modern historians place the event about the beginning of the Christian era. Koreans were the civilizers of Japan. Confucianism is thought to have been introduced about 415 A. D.; Buddhism, in 552. In 604 the earliest Japanese laws were written in Chinese. The government was modeled upon that of China.

Medieval Government. From the middle of the 8th century onward, the country was governed by military families or by armed monastic communities, whose heads exercised a regency, while the emperor, often a minor, was a mere figurehead.

Near the end of the 16th century, Nobunaga attempted to subjugate the armed Buddhist communities. He was assassinated. Hideyoshi followed

and established peace. About 1600, Iyeyasu established a feudal government, known as the Tokugawa Shogunate, with its capital at Yedo, the present Tokyo. Nominally, the shogun was appointed by the emperor, but the emperor could not remove or punish him, so long as the shogun's family possessed the power. On the other hand, the shogun sometimes removed and exiled an emperor.

Early Relations with Western Nations. It was during the 16th century, too, that Europeans made their first acquaintance with Japan. Mendez Pinto, a Portuguese, was shipwrecked on the coast of Japan in 1542. This led to a visit by St. Francis Xavier in 1549. Thousands of Japanese became Christians. Missionaries and merchants of various nationalities followed the Portuguese. Much rivalry was created. Religious jealousy mingled with political intrigue and the strife of feudal clans. Hideyoshi, moved in part, perhaps, by the fear of foreign domination, sought to banish the missionaries. The attempt failed, and in 1596 the authorities, in order to terrify the Christians, seized several of them, together with a number of missionaries, and crucified them at Nagasaki. This persecution led to a rebellion of the Christians, which was punished in 1606 by an edict forbidding the exercise of the Christian religion. Another Christian conspiracy in 1611 brought about the expulsion of the missionaries in 1614. In 1636 an edict excluding all foreigners and prohibiting all intercourse with foreign countries was issued.

Commercial Treaties. In 1852 the American government, in order to secure the protection of American sailors shipwrecked on the coasts of Japan, and in the hope of opening ports where American vessels might obtain supplies, sent Commodore Perry to Japan to attempt to establish treaty relations. He arrived in Japan in July 1853 and delivered the president's letter to the shogun. In February 1854 he returned for a reply, and in March that year signed the treaty that opened Shimoda and Hakodate to the use of American vessels. A commercial treaty between the two countries was signed in 1858. The example of the United States was followed by other countries.

The signing of the treaties by the shogun provided a rallying cry for the clans that opposed the Tokugawa Shogunate. A civil war was followed in 1867 by the restoration of the emperor to real power and by the removal of the capital from Kyoto to Tokyo in 1868.

Modern Progress. In 1871 feudalism was abolished. Western laws and military organization were introduced. Teachers from America and Europe were invited to establish schools. A constitution was proclaimed in 1889, and the first Parliament assembled in 1890.

The extraterritorial jurisdiction enjoyed by foreign powers over their nationals resident in Japan was surrendered in 1899. Tariff autonomy was not fully recovered until 1911. These two accomplishments were perhaps aided by Japan's triumph over China in the war of 1894–95.

Russian intrigue in Korea led in 1904 to war with Russia, which secured for Japan a protectorate over Korea and the transfer to herself of Russian leases of railways and ports in southern Manchuria, together with certain mining rights. In 1910 Japan annexed Korea.

Japan in World War I. During World War I, Japan, assisted by Great Britain, expelled the Germans from Kiaochow, leased territory in China, and took possession of the former German rights in the province of Shantung. These rights were eventually relinquished to China by treaty in 1922.

World War I gave Japan also a mandate over the islands north of the equator, formerly belonging to Germany. The mandate was not recognized by the United States until the Treaty of Yap was signed on February 11, 1922, in which Japan acknowledged certain American rights in Yap.

Recent Developments. The Anglo-Japanese defensive alliance of 1902 was replaced in 1922 by an agreement between the United States, Great Britain, France, and Japan to respect one another's rights in their insular possessions in the Pacific. In 1924 the Japanese Diet abolished the dual nationality of Japanese born in foreign lands, thereby removing a serious objection in certain countries to Japanese immigration.

A serious earthquake, resulting in great loss of life and enormous destruction of property occurred September 1, 1923. The emperor, Hirohito, succeeded to the throne on Dec. 25, 1926. The first parliamentary election under a new manhood suffrage act was held in 1928.

In 1931, Japan began a career of expansion by attacking Manchuria, and turning it into a puppet state, called Manchukuo. Further aggressions on northern China followed, including the seizure of Peiping. From 1937 to 1940 Japan conquered, without a formal declaration of war, a half million square miles of China, including its six largest cities. All this was pursuant to the policy of establishing in Asia a "co-prosperity sphere," which aimed eventually at driving out the Europeans. The government believed that an opportunity offered when Hitler's Germany proposed an alliance in 1936. In 1940, Japan attacked Germany's enemies in Asia, chiefly the dependencies of Great Britain, and in a surprisingly short time overran all southeastern Asia. Then Japan suddenly attacked Hawaii and wiped out most of the American fleet. For the turning of the scales against Japan and her final defeat, see *World War II*.

Japan surrendered formally and unconditionally September 1, 1945. Complete authority now passed to the Allied Supreme Commander, General Douglas MacArthur, and the Allies began a complete reorganization of Japan. Emperor Hirohito abjured the myth of his divine origin and that of his race. The old feudalism and the modern monopolistic industrialism were attacked. The power of the ruling classes was broken, and their leaders excluded from office or brought to trial as "war criminals." Parliament was summoned and a new constitution was prepared and promulgated November 3, 1946. On September 8, 1951, a treaty of peace was signed by Japan and the representatives of 48 countries at San Francisco. Japan again became a sovereign nation April 28, 1952.

Postwar Japan amazed the world by the speed with which the people adapted themselves to their new situation. Democratic government took root. Agricultural productivity, following on land reform, radically reduced the need for imports. Although without iron ore, Japan broke into the front rank of steel producers and became the world's largest shipbuilder. Relying on American protection, Japan was able to spend comparatively little on armaments since its new constitution forbade it to engage in war.

THE JEWS

The word *Jew*, derived from *Judah*, designates the Hebrew people as a religious group, a church, in contrast to the terms Israel and Israelites, which designate them as a national group. The Hebrew people, like all the kindred Semites, were cradled in the Arabian desert. They migrated thence in small tribal groups between the 15th and 12th centuries B. C. and settled in Palestine. In this movement, Moses and Joshua were the main figures. Moses led a few small tribes forth from Egypt, where they had been dwelling, federated them with other small tribes of the desert, established for them the worship of Yahwe, founded certain legal institutions that became the nucleus of the later Israelite law code, and settled his followers in southern Palestine. Joshua was the leader of another group of tribes that settled in the central part of Palestine.

The Early Kingdom of Israel. There the Israelite tribes encountered powerful enemies, especially the Philistines. After a century-long struggle with them, Israel finally triumphed about 1000 B. C., chiefly through the able leadership of David. This struggle welded the originally independent tribes into one compact nation with many national traditions. Among these was the tradition of the descent of all the Israelite tribes from one common ancestor, Abraham, and his descendants, Isaac and Jacob. Many stories and traditions about these prehistoric figures are recorded in the book of Genesis. Some may possess a basis of historic truth. Furthermore, the figures of Moses and Joshua have been enveloped in legend until the true story of these men and their times is not definitely known by historians.

Israel's recorded history begins with the entrance of the tribes into Palestine. But we tread firm historical ground only when we reach the time of David. After his conquest of the Philistines, David subdued the surrounding nations. His empire was consolidated by his son Solomon. A rebellion of the northern tribes, provoked by taxation, after Solomon's death in 932 B. C., divided his realm into the Northern and Southern kingdoms, called Israel and Judah respectively.

Northern and Southern Kingdoms. The Northern Kingdom lasted until 722 B. C., when the Assyrians destroyed the capital, Samaria, and deported a considerable number of people. These mixed eventually with other Eastern nations and disappeared. Tradition speaks of them, though incorrectly, as the Ten Lost Tribes. The Southern Kingdom endured until overthrown by the Babylonians in 586 B. C. Many of the people were carried away to exile in Babylonia, while others, among them the prophet Jeremiah, fled to Egypt.

The Prophets. But, while Israel's national existence was brief and ill-starred, during this period the beginning of Israel's chief contribution to human civilization was made. Amos, Hosea, Isaiah, Jeremiah, and their fellow-prophets gave to the old tribal and national religion a significant reinterpretation. They conceived of Yahwe as Creator of the entire universe, the loving Father of mankind; all men, God's children, therefore, they regarded as brothers, forming one human family. They denounced idolatry, immorality, and social injustice, and proclaimed that above all else God desires that men do justice, love mercy, and walk humbly with Him. They thus established ethical monotheism, a universalistic conception of both God and man, and justice and love as the basic forces of human conduct.

The Return from Exile. Cyrus, founder of the Persian empire, permitted the exiles in Babylonia to return to Palestine in 536 B. C., undoubtedly for political reasons. But only a comparatively few did so, and that no longer as an independent nation, Israel, but solely as a religious community. Henceforth they are known as Jews. Under Ezra and Nehemiah, Judaism was definitely established. From 536 B. C. on, the Jews of Palestine were successively vassals of Persia, Alexander the Great, Egypt, and Syria. During this entire period, with the exception of the short reign of Alexander, increasing oppression was their lot.

The Dispersion. Finally, in 166 B. C., under the Maccabees, they revolted against Syria, and through marvelous heroism against tremendous odds they regained independence and set up their own kings, the Asmonean dynasty. But this new independent Jewish state was short-lived. It crumbled with the conquest of Syria by Pompey in 63 B. C. For a while it continued as a Roman vassal under a semi-Jewish dynasty, Herod and his successors. During this period Jesus of Nazareth lived and worked and Christianity arose. Finally, in 70 A. D., after a heroic but fruitless defense, the Romans under Titus captured Jerusalem, destroyed the Temple, massacred thousands of Jews, and sold other thousands as slaves throughout the world. A heroic attempt to regain independence under Bar-Cochba in 132–135 A. D. failed miserably. Hadrian completed Titus's work of dispersion.

During the next two centuries the interest of the Jews remaining in Palestine centered in their religion. About the year 200 the *Mishna*, an extensive legal code, was compiled, and about 330 the *Palestinian Talmud*. At nearly the same time Constantine closed the great rabbinical schools.

Since the Babylonian Exile a large Jewish population had flourished in Babylonia. This now became the chief center of Jewish life and thought. There the *Babylonian Talmud* was compiled about 550. Under the Mohammedan rulers the lot of the Jews improved materially.

The Jews in Europe. But, with the decadence of Mohammedan power in the East, the center of Jewish life gradually shifted to Europe, particularly to Spain, where Jews attained great influence in both learning and commerce, and occasionally even became royal counselors. In southern Russia in the 7th century the entire Tatar kingdom of the Chazars was converted to Judaism. During this period Jewish scholars translated much of Arabic literature into European languages, thus giving Arabic science and philosophy to Europe.

The religious zeal and bigotry fostered by the Crusades reacted unhappily upon the Jews. Increasing oppression became their lot. They were successively banished from England, France, Spain, Portugal, and many of the small German states. However, Italy, Poland, Turkey, and especially Holland granted them refuge. Cromwell finally permitted them to return to England. In Holland, Baruch Spinoza, the Jew, laid the foundations of modern philosophy. In many cities of Italy, however, and of other countries to which Jews were admitted, ghettoes were established—districts where Jews were required to dwell and out of which they might pass only if wearing a distinctive garb. See *Ghetto*.

The French Revolution and the rise of liberalism had a tendency to dissolve anti-Jewish animus. Since that time, waves of anti-Semitism have swept over parts of Europe.

Anti-Semitism. The characteristic of more recent anti-Semitism is that it is based less on religious considerations than on national, racial, and economic ones. This turn was first given as a result of a pamphlet published in 1873 by a Hamburg journalist, *Jewry's Triumph over Germanism*. This book attributed to international Jewry a severe economic depression that followed three years after Germany's triumph over France. The book had a great influence throughout central Europe and Russia. Anti-Jewish political parties were formed in several countries.

The movement was gradually discredited in Germany. In France it did not survive the Dreyfus Affair as a political factor. See *Dreyfus Affair*. In Russia, it exploded in the pogrom of Easter, 1881.

The second wave of anti-Semitism likewise took its rise in Germany. Hitler rose to power in the 1930's by fanning the flames of German nationalism and pride of race, the chief enemies of which he declared were the twin evils of Jewry and Communism. His ascendency brought laws which deprived Jews of civil and political rights. He then began a systematic extermination of all persons of Jewish origin. An estimated 5 million were put to death before Hitler's overthrow in 1945.

The Jews in America. In the 17th century, Jews sought in North America a refuge from European persecution. The first notable migration was that of a group from Brazil to New Amsterdam, in 1654, while that colony was under Dutch rule. In 1658, a few Jews settled in Newport, R. I., under the conditions of religious toleration which prevailed in that colony. There were Jewish settlements in other colonies before the Revolution.

Zionism. In general this was a plan to establish an autonomous Jewish state in Palestine. It had a twofold source, the ancient dream of a restored Israel and the need of an asylum for oppressed Jews. The Zionist Organization was founded in 1897, under the leadership of Theodore Herzl.

Balfour Declaration. On November 2, 1917, Lord Balfour issued the following statement on behalf of the British government: "His Majesty's government view with favour the establishment in Palestine of a national home for the Jewish people, and will use their best endeavours to facilitate the achievement of this object, it being clearly understood that nothing shall be done which will prejudice the civil and religious rights of existing non-Jewish communities in Palestine or the rights and political status enjoyed by Jews in any other country."

A mandate for Palestine was assigned to Great Britain after World War I, and, in 1923, effect was given to the Declaration. See *Palestine.*

JORDAN

This Arab state, included in the British mandate of Palestine, was given a separate administration under Emir Abdullah in 1923. Britain recognized its independence in 1946 and the Emir became King Abdullah ibn Hussein of the Hashemite Kingdom of Jordan. When Israel declared its independence in 1948, Jordan became the battleground for the war in which the Arab League tried but failed to crush Israel. A truce agreement gave Old Jerusalem to Jordan and designated eastern Palestine as an asylum for Palestinian Arabs. Annexation of this area with its million refugees by Egypt and Jordan created many problems. Abdullah was assassinated by a League member in 1951. His son Talal, mentally ill, was deposed and Talal's son became Hussein II in 1952. Considered pro-Western, Hussein was frequently in dispute with his Arab neighbors. In 1958 he turned from Britain to the U.S. for financial aid. The Arab League urged Hussein to a sterner attitude toward Israel, culminating in the 1967 Arab-Israeli war. Defeat brought Jordan the loss of Old Jerusalem and the territory west of the Jordan River. Throughout 1968 serious clashes continued between Israel and Jordan-based guerrillas. In 1970, Palistinian refugees attempted to take power but were defeated and confined to a few camps in the north. Jordan was only briefly involved in the 1973 Arab-Israeli War and continued good relations with the U.S.

KOREA (CHOSEN)

Tradition carries the story of the Asiatic country of Korea (*kô-rē'a*) back to about 1122 B. C., when Ki-tse is said to have founded a state. The first authentic date marks the annexation of the country to China in 108 B. C. About 960 A. D. a period of great prosperity and progress began, which continued for several centuries. Art, religion, literary forms, and governmental methods were borrowed from China. In 1392 Buddhism was displaced in favor of Confucianism. In the 16th century the Japanese, led by Hideyoshi, the Japanese regent, occupied much territory for a time, being driven out finally by Chinese forces. Early in the 17th century the rising Manchu power overran the country and exacted tribute, which was afterward paid annually to the Manchu rulers of China until 1894.

Until very recently, most of our scanty knowledge of Korea was obtained from the narratives of Dutch sailors who were wrecked on the Korean coast in 1653 and detained in the country some years. For Korea was determined to seclude herself from the world.

From 1835 till 1860, several French missionaries contrived to find shelter, and, in spite of persecutions, the Christian community, founded in the 18th century, continued to increase. In 1864 a reactionist was made regent, and he encouraged persecution of Christians.

In 1876, however, Korea made a treaty with Japan, and, later on, through Admiral Shufeldt, with the United States,—followed by others with England, Russia, France, Germany, and Italy. After Japan's victory over China, in 1895, Korea's independence was recognized by both powers. In 1907, pursuant to the recognition of Japan's interests by the Treaty of Portsmouth, Korea practically passed under a Japanese protectorate and in 1910 was annexed to that empire, under the ancient name of Chosen. In 1945 it was taken from Japan, and was promised ultimate independence. The Americans occupied southern Korea up to 38°; the Russians, the north. As a result of disagreements between the two powers, two governments were set up in 1948, a Communist government and a republic under U.S. protection. See *Korean War.*

LEBANON

Owing to its cross-roads position, Lebanon enjoyed a flourishing trade with neighboring countries as early as the 13th century. Lying between Israel and Syria, with which it was formerly combined, Lebanon was made a republic under French mandate after World War I, and was recognized as an independent state in 1941. The constitution of the country provided for governmental separation along religious, or "confessional," lines. The Maronite Catholics controlled the presidency, the army, and a majority in parliament while the Moslems remained second-class citizens. The situation was complicated by the influx of Palestinian refugees and the establishment in Lebanon of the main base of the Palestine Liberation Organization (PLO). By 1975, Moslems made up 60 percent of the population. The country experienced strife in 1958, when American troops landed to help restore order, and in 1969, when war was narrowly averted. In 1975, full-fledged civil war erupted as Moslems and the PLO tried to gain more control. As the fighting escalated, other Middle Eastern countries became involved. The Moslems received support from Iraq and Egypt while Israel aided the Christians. In late 1976, Syria, which had tried to help in negotiations, invaded Lebanon to crush the PLO and to gain influence in the eventual resolution of the civil war.

LIBERIA

Liberia is an independent Negro republic on the west coast of Africa. It had its origin in the plan of the American Colonization Society, founded in 1817, to colonize free Negroes from the United States. The name is derived from the Latin word *liber*, meaning "free." Settlement of the territory acquired by the Society began in 1822, and in 1838 a government called the Commonwealth of Liberia was organized. The independent Republic of Liberia was established in 1847. Only persons of Negro blood may become citizens. Liberia declared war on Germany in 1917, and again in 1942. She has permitted the United States to establish military bases in her territory.

LIBYA

The former Italian colony of Libya on the Mediterranean coast of North Africa has been a coveted prize for the last 2000 years. It was dominated successively by Carthage, Rome, the Vandals, Islam, the Ottoman Empire, and, from 1911 until World War II, by Italy. The British and French then held control until it was declared an independent federal kingdom in 1951 under King Idris I, pursuant to resolutions passed in the United Nations. Idris ruled until 1969 when he was deposed by a military junta led by Muammar al-Qaddafi. Under the new leadership, foreign oil interests were nationalized and Libya became a leader in efforts to unify the Arab world.

LIECHTENSTEIN

Liechtenstein (*lĭĸ'tĕn-shtīn*) is a principality lying between Austria and Switzerland. It consists of territory which came into the possession of the house of Liechtenstein at the beginning of the 18th century, and it was made a principality by the emperor Karl VI in 1719. From 1815 to 1866 it formed part of the German Confederation. Later it was practically a dependency of Austria, but in 1918 the Diet resolved to establish independence.

LUXEMBOURG

Luxembourg (*lŭk'sĕm-bûrg*) is a grand duchy bordering France, Belgium, and Germany. It was made a duchy within the German Empire by Charles IV in 1354. In 1814 it was raised to a grand duchy under the king of Holland but passed to the duke of Nassau in 1890. It was included in the German Confederation from 1815 to 1866. The Treaty of London in 1867 declared Luxembourg neutral territory and guaranteed its independence. It was overrun by the Germans in 1914, but regained its independence in 1919. On May 10, 1940, the Germans again occupied it, and Grand Duchess Charlotte took refuge in Canada. It was liberated by American troops in September 1944.

MALAGASY (MADAGASCAR)

This island off the southeast coast of Africa was given its name Madagascar by Marco Polo, although he did not actually visit the island. Diaz disembarked there in 1500. France made it a protectorate in 1885. The last native monarch was Queen Ranavolona III, who was deposed in 1895, and the island became a French colony. Despite some abortive efforts to secure independence, the island remained under French rule until 1958. In that year a referendum was held under French auspices, and the people chose independence within the French Community. By a constitution adopted in 1959, it became the Republic of Malagasy.

Mesopotamia. See *Iraq*.

MONACO

Smallest state in the world, the principality of Monaco (*mŏn'-ā-kō*) occupies a strip of Mediterranean coast about two miles long and not more than three-fifths of a mile wide at any point. On the landward side, the country is entirely surrounded by France. Italian is the language spoken, but finances and custom privileges are under French control. As a winter resort, and especially as a gambling center, Monaco is world-famous. Income from the gambling concession and from the issuance of postage stamps has provided most of the revenue.

Politically, Monaco has a long history of independence, or near-independence, dating back to the 14th and 15th centuries, when it was ruled by the Genoese family of Grimaldi. Albert I, who reigned from 1889 to 1922, changed Monaco from an absolute to a limited monarchy in 1911. His grandson, Prince Rainier III, became ruler in 1949.

MOROCCO

This country was held by the Romans under the name of Mauretania. It was taken by the Vandals in the 5th century A.D. The Arabs conquered it about 700 A.D. and imposed the Mohammedan religion upon the native Berbers. Morocco later became independent under a Berber dynasty and extended its power as far east as Egypt, conquered Spain, and penetrated deep into France until checked by Charles Martel in 732 A.D. These Moors, as they were generally known in Europe, were driven from Spain in the early 13th century. Morocco was one of the so-called Barbary states until the 20th century. Spain held a portion of the territory from 1860. In 1894, an American citizen Ion Perdicaris was seized and held for ransom by Raia-Uli, a Moroccan chief. He was released after American and European pressure. France held most of Morocco as a protectorate from 1912 to 1956, when Morocco was recognized as an independent country. Under a constitution adopted in 1962, it became a limited monarchy.

THE NETHERLANDS

The northern European kingdom popularly called Holland. Originally, the name, meaning "low countries," applied to all the territory now included in Holland, Belgium, and northeastern France. Julius Cæsar found this country peopled by the Frisii in the north, the Batavi in the center along the lower Rhine, and the Belgæ in the south. Cæsar brought the Gallic Belgæ into subjection to Rome, but the Germanic tribes of the Batavi and the Frisii resisted Roman conquest somewhat longer. They finally made peace and were recognized as allies. The low-lying territory of the Batavi between the Waal and the Rhine, known as the "island of the Batavians," was long an important outpost of the empire. Batavian soldiers served in Roman armies and formed a large part of the Prætorian guard. By the end of the 3d century, when the Franks began their inroads, the Batavi, as well as the other tribes within the Roman frontier, had become Romanized. But the Frisii, or Frisians, allied with the Saxons, held the seacoast from the Scheldt to the Ems in defiance of the Franks, until the time of Charlemagne. They resisted Christianization as well as Frankish conquest, and their conversion was more the result of armed compulsion than of missionary zeal.

The division of Charlemagne's empire in 843 gave the part of the Netherlands east of the Scheldt river to Lothair, to be known as Lothair's kingdom, or *Lotharii Regnum*, whence comes the name Lorraine. It finally passed to the East Frankish power, and in 953 Otto the Great transferred it to Bruno, archbishop of Cologne. Bruno divided his lands into Upper and Lower Lorraine, giving the charge of the latter to Godfrey of Verdun. This territory, difficult of access, far removed from both French and German seats of government, but open to the ravages of the Northmen on its rivers and coast line, now became for two centuries the scene of pirate raids and petty dynastic struggles.

Rise of Free Cities. At the close of the 11th century, stable government began in these feudal states, and then the Crusades opened a new era. The soldiers of the Netherlands distinguished themselves with a valor equal to that which had made their ancestors famous in Roman times. New avenues of trade were opened up, and the cities of the Low Countries began their wonderful growth in industry and commerce. Free cities and communes, governed by burgomasters and sworn councilors, flourished as practically self-governing republics. This development was slower in the North than in the South. The charters of the free cities of Holland and Zealand date from the 13th century, while those of the communes of Flanders date from the 12th. The latter also came earlier into conflict with the dukes of the great Burgundian power. In the 15th century the house of Burgundy brought all the Netherlands under its control; but lack of statesmanship wrecked the promising schemes of Duke Charles the Bold, and in 1477 the marriage of his daughter Mary to Maximilian of Austria threw the Netherlands into the power of the Habsburgs.

Period of Spanish Rule. In February 1477, the provinces secured Mary's signature to the Great Privilege, a charter confirming their political rights and local liberties. Her grandson, who in 1519 became emperor as Charles V, was born and brought up in the Netherlands, and his policy, administered first through his aunt, Margaret, and later through his sister, Mary, was moderate and progressive. But the notable spread of Protestantism, especially in the northern provinces, moved him to severe measures of restraint. His son, Philip II, a thorough Spaniard, who lacked sympathy with the Netherlands, used every means at his command to suppress both civil and religious liberty. By the year 1566

the most violent passions had been aroused, and fanatical mobs, called iconoclasts or "image breakers," spread ruin among the churches and religious houses. In 1567 Philip sent the duke of Alva to curb the disturbance with Spanish and Italian troops. Six years of pitiless, bloody severity served to bring him the curses of the Netherlands as well as the disfavor of Philip. He resigned in 1573.

The most important result of Alva's rule was the revolt of the northern, Protestant provinces under the leadership of William of Orange. Their struggle for independence is one of the most splendid episodes in history. Again and again they cut their dikes and flooded hard-won land to baffle the foreign troops. The University of Leyden is a memorial founded in 1574 by the province of Holland in honor of the deliverance of the city of Leyden, accomplished by the help of a great flood over the broken dikes. In 1576 the southern provinces, terrified by the outrages of the mutinous Spanish troops, joined with the northern provinces in the Pacification of Ghent. But the policy of Alessandro Farnese won the southern, Catholic provinces back to Spain, and in January 1579 Holland, Zealand, Utrecht, Gelderland, Friesland, Overyssel, and Gröningen bound themselves together in the Union of Utrecht, thus founding the modern state of the Netherlands.

Independence of Dutch Republic. William, called "the Silent," was murdered in 1584, but the struggle was continued by his son, Maurice of Nassau, stadholder of Holland and Zealand. The merchants of these two provinces had prospered and achieved a Dutch supremacy in trade, which continued through the 17th century. They had no other thought but that of independence. In 1609 a twelve years' truce was concluded with Spain, but not until the close of the Thirty Years' war was the independence of the United Provinces finally recognized. During this time the Union was a confederacy of sovereign states, among which Holland was leader. In 1651 the office of stadholder was abolished, and the head of the Union was called the grand pensionary. For twenty years this office was held by the statesmanlike John de Witt; but in 1672, when Louis XIV attacked the Netherlands, the prince of Orange, afterward William III of England, was made stadholder and captain general.

The Kingdom of the Netherlands. During the 18th century the United Netherlands, or Dutch Republic, played a secondary rôle among the nations, and internal government with the old machinery was becoming more and more difficult when the French Revolution broke out. In 1795, under French direction, the Batavian Republic was organized on the wreck of the United Netherlands. In 1806 Napoleon made the country a kingdom, and in 1810 he incorporated it in the French Empire. The Congress of Vienna united it with Belgium in the Kingdom of the Netherlands, but the Belgians withdrew in 1830.

The people of the United Netherlands, under their old republican, stadholder system of government, had been pioneers in many features of modern democracy. The ideas of a written constitution and a state-supported school system are rightly credited to them. Religious toleration made the Netherlands the refuge for the persecuted of all nations in the 17th century. The rights of the provincial states and the States-General had been jealously guarded. The Fundamental Law of 1815, however, quite in the spirit of the Congress of Vienna, provided for a constitutional monarchy in which the king was more powerful than the Parliament, or States-General, which could not originate or amend legislation.

The Dutch maintained their neutrality in World War I under difficult conditions. In World War II they were less fortunate. The Germans invaded the country in May 1940. The queen and ministers escaped to England and carried on from there. (See *World War II*).

Queen Wilhelmina returned in May 1945. On September 4, 1948, she abdicated the throne, and was succeeded by her daughter, Princess Juliana of Orange and Nassau. Queen Juliana, born in 1909, is married to Prince Bernhard, who received the title of Prince of the Netherlands on her accession.

NORWAY

Like the other Scandinavian peoples, the Norwegians have a long legendary story preserved in sagas. But the authentic history of Norway begins in the latter part of the 9th century A. D. in the time of Harold Fairhair, who united the petty tribal kingdoms under his authority and died about 933. This was the period of the Norse sea rovers. Contact with the more civilized peoples of Europe resulted in the establishment of Christianity in Norway in the 10th and the 11th century. Olaf the Saint, who was a zealous apostle of the new faith, ruled the turbulent chieftains from 1015 to 1028. He was slain in 1030 in war with rebellious subjects who invited Canute of Denmark and England to come to their aid. Olaf's son, Magnus I, recovered the throne from Canute's son Svein in 1035, and henceforth, till 1319, Norway was governed by native kings.

Union with Sweden and Denmark. During this period the country was prosperous. The small landholders gained political control, and Norse colonies were established in Iceland and Greenland. The death of Hakon V in 1319, without male heirs, threw the election of a new king into the hands of the National Assembly, who, after many discussions, made choice of Magnus VII of Sweden, the son of Hakon's daughter. He was in turn succeeded by his son Hakon and his grandson Olaf V, who, having been elected king of Denmark in 1375, became ruler of the sister Scandinavian kingdoms on the death of his father in 1380. This young king, who exercised only a nominal sway under the guidance of his mother, Queen Margaret, heiress of Waldemar IV of Denmark, died without issue in 1387. Margaret's love of power and capacity for government brought about her election to the triple throne of the Scandinavian lands, and from this period till 1814 Norway continued united with Denmark.

While Norway shared in the general fortunes of Denmark, it retained its own constitutional mode of government and exercised its right of electing its monarchs. After a time, like the sister kingdom, it agreed of its own free will to relinquish this privilege in favor of hereditary succession to the throne. The Napoleonic crisis may be said to have severed this union, which had existed for more than 400 years; for Denmark, after having given unequivocal proofs of adhesion to the cause of Napoleon, was compelled, after his defeat, to purchase peace at the cost of sovereignty over Norway. Crippled in her resources and almost bankrupt, she saw herself constrained to sign the Treaty of Kiel in 1814, by which it was stipulated by the allied powers that she should resign Norway to Sweden, receiving in return, by way of indemnity, some portion of Swedish Pomerania and the island of Rügen, which were subsequently exchanged with Prussia for Lauenburg.

Union of Norway and Sweden. The Norwegians, having refused to admit the validity of the Treaty of Kiel, nominated Prince Christian, heir presumptive to the throne of Denmark, as regent and subsequently king of Norway. This nomination was made by the Constitutional Assembly, which also drew up a constitution based on the French constitution of 1791. These measures found, however, neither supporters nor sympathizers among the other nations. With the sanction of the great allied powers, Charles John Bernadotte, crown prince of Sweden, led an army into Norway and, after taking Frederikstad and Frederikshald, threatened Christiania. Norway, being utterly destitute of the means necessary for prosecuting a war, accepted union with Sweden on the basis of equality of the two kingdoms. Norway retained self-government.

Independence of Norway. The growth of parliamentary government brought about a desire on the part of the parliaments of both Sweden and Norway to control the king's selection of ministers and his foreign policy. This condition kept alive Norwegian impatience with the union. Besides, Sweden was aristocratic, while Norway was strongly democratic. In spite of the royal veto the Norwegian parliament abolished the orders of nobility in that country. Meanwhile, Norway became prosperous and developed a large commerce. This led to demand for a separate consular service. After several years of dispute, the Norwegians declared the union with Sweden dissolved in 1905. Their decision was confirmed by the Treaty of Karlstad. Prince Charles of Denmark became king of Norway as Haakon VII.

The World Wars. Norway remained neutral and fairly prosperous during World War I. In World War II the Germans invaded Norway in April 1940, and conquered it after a stiff resistance. They set up a puppet government under Vidkun Quisling, which most of the people resisted. The great merchant fleet and all other resources outside of the kingdom were put at the service of the Allies. On June 7, 1945, King Haakon returned amid popular rejoicing.

PALESTINE

Previously to the 16th century B.C., it appears that Palestine was subject to the power of Babylon. Babylonian culture persisted even when the territory was mastered for a time by the Amorites. Early Egyptian records disclose the fact that the peoples of Canaan, as Palestine was at that time called, had commercial relations with Egypt. Canaan was conquered by the Egyptian king, Thothmes III, in the first half of the 15th century B.C.

The period of Egyptian supremacy was interrupted for some time by the inroads of the Hittites from the north. About 1350 B.C., however, the power of Egypt was again dominant in Canaan. It was within the following two centuries that the country was subjected to invasion by the Israelites.

For a brief period in the 10th century B.C., the entire land of Canaan, with some adjacent territory, was brought under the power of the independent kingdom of Israel and was ruled by David and by his successor, Solomon. The subsequent division of the realm between northern Israel and Judah left the land an easy prey to the Assyrian and the Babylonian empire. The northern kingdom fell in 722 B.C., and the southern, Judah, in 586 B.C. The inhabitants of the latter kingdom, known as Jews, were taken as captives to Babylon. Being permitted by Cyrus, the Persian, to return in 536, they became the nucleus of a small Jewish community.

The conquests of Alexander, at the end of the 4th century B.C., brought a strong Greek influence to bear on the country. After the death of Alexander, Palestine passed first under the control of the Ptolemies of Egypt, and, later, in 197 B.C., it came into the power of Antiochus of Syria. In 168 B.C., the Jews, led by the Maccabean princes, threw off the tyranny of the Syrian ruler and set up an independent state extending throughout southern Palestine from the river Jordan to the sea.

In 63 B.C., internal strife opened the way for intervention and conquest by the Romans. A revolt of the Jews in 66-67 A.D. resulted in the destruction of Jerusalem (70 A.D.). A second rebellion, in 132-135 A.D., terminated in the final dispersion of the people.

For a brief period in the early part of the 7th century, Palestine was under Persian control. In 636, Jerusalem surrendered to Mohammedan armies under Omar.

Toward the end of the 11th century, Palestine became the goal of the crusaders, who, in 1099, established in the Holy Land the Latin kingdom of Jerusalem. This kingdom lasted barely a century. The country remained in the hands of Mohammedan powers until it was conquered by Allied troops in 1918, and assigned as a mandate to Great Britain.

Britain held out hope of a Jewish homeland in Palestine. The Jewish Zionist organization fostered immigration, especially from Nazi persecution, but the Arabs bitterly opposed it. British proposals for partition were rejected. In 1948 Britain resigned its mandate and withdrew. Jewish leaders promptly proclaimed Israel independent. Arab forces invaded from all landward sides. The UN proposed dividing Israel into an Arab and a Jewish state. Meanwhile, Israeli forces drove back the Arabs and conquered 50 per cent more territory than allotted to it by the UN. An armistice ensued, but the Arabs refused to make a peace treaty.

Despite Arab economic boycotts, Israel, led by Premier Ben-Gurion, grew rapidly. In 1950 the "law of return" gave every Jew the right to enter as an immigrant. The Jewish population increased from 130,000 in 1930 to 2,700,000 by 1968. Loans from the U.S. and indemnities paid by West Germany were used to develop the country.

When Egypt seized the Suez Canal in 1956, the Israelis drove them from the territory east of the canal, but withdrew when the UN raised a special force to guard the Egyptian border. In May 1967, Egypt had the UN force withdrawn, then closed the Gulf of Aqaba to Israel. Attacking on June 5, Israel defeated the combined Arab forces in 6 days. The UN arranged a cease-fire but no peace treaty. Frequent skirmishes continued in 1968, but Israel, awaiting direct Arab negotiations, held on to the Golan Heights in Syria, the entire west bank of the Jordan, the Gaza Strip, and the Sinai Peninsula.

In addition to the Israeli-occupied Arab territory, a main obstacle to peace was the plight of the Palestine refugees. Displaced by the creation of the Israeli state, as many as 2 million Palestinians had been living since 1948 in camps in adjacent Arab nations. Arab nations refused to absorb the people, claiming that it would imply recognition of Israeli sovereignty, while Israel claimed that it was Arab aggression that had caused the problem. Attempting to regain their homeland, refugees began terrorist activities in the 1950s. By the late 1960s, most of the refugee groups had consolidated into the Palestine Liberation Organization (PLO) led by Yasir Arafat. Recognized by many countries as a government in exile, the PLO considered itself the "third front" (with Syria and Egypt) in the fight against Israel.

Plagued by Palestinian terrorist activities, Israel nevertheless felt militarily secure after the 1968 war. But a surprise attack by Egyptian and Syrian forces in October 1973 dealt a severe blow. Only with massive U.S. military aid were the Israeli forces able to repel the attack. After two weeks of fighting, the Israeli army had regained lost ground and was advancing on Cairo when pressure from the U.S. and the Soviet Union produced a cease-fire. By the 1975 Sinai agreements, a large UN buffer zone was created between Israel and Egypt, and U.S. aid was guaranteed to Israel. Although the threat from Egypt had been lessened, Israel still had many problems. Golda Meir, prime minister since 1969, resigned in 1974 and was replaced by Yitzhak Rabin. Rabin resigned as his party's candidate in the 1977 election because of illegal personal bank accounts in the U.S. Manachem Begin became prime minister. He faced spiraling inflation and widespread dissatisfaction caused by the large amount spent on national defense. The solution to the Palestine question remained unanswered and Syria still threatened from the north. See *Jews*.

PARTHIA

Parthia is the name of the ancient empire of the Parthians, a people related to the Mongols. Their original territory lay to the southeast of the Caspian Sea. They were conquered by Cyrus the Great of Persia in the 6th century B.C., but in 250 B.C. they revolted. From that time the empire of Par-

thia was rapidly extended as far as the Euphrates and Indus. It successfully repelled Roman attacks until 217 A. D., when, after the battle of Nisibis, both sides were ready to make peace. In 226 the Parthian empire, weakened by factional conflicts, passed to the Persian dynasty of the Sassanidæ.

PERSIA (IRAN)

The ancient Persians were an Aryan people who occupied territory to the east of the Persian Gulf and were for a time subject first to Assyria and then to Media. In 553 B. C., under the leadership of Cyrus the Great, they revolted against the Medes. Three years later the union of the Persians and Medes began the Persian empire.

The Reign of Cyrus. Cyrus pushed the boundaries of his domain westward to the Mediterranean and the Ægean coasts, eastward almost to the Indus. He subdued Babylonia and Lydia. The return of the exiled Jews to Palestine was part of his scheme to have loyal colonists on the western borders of his empire. His successor, Cambyses (529–522 B. C.), brought Egypt within his control, and Darius the Great (521–486 B. C.) added Macedonia and Thrace in Europe and the Punjab in India to the Persian dominions. Darius organized the civil government under satraps, or governors, thus separating the civil from the military authority in each province. He built splendid roads, the most important of which, the Royal Road from Susa, the capital, to Sardis in Lydia, was 1500 miles long.

Greco-Persian Wars. But the "great king," with his formidable masses of soldiery, met a new type of foe when he attempted to push his conquests farther into Europe. The Athenians, realizing the danger in the Persian advance, gave aid to the Ionian cities of Asia Minor in a revolt (499–493 B. C.). Darius crushed this rebellion and then set out to punish the Athenians. But at the battle of Marathon in 490 B. C. the Greeks, under Miltiades, gave the Persian forces a defeat that sent them back to Asia. Ten years later, Xerxes bridged the Hellespont with boats and built a canal through the promontory of Mt. Athos. Treachery alone gave his troops access to Greece through Thermopylæ, but the Greek fleet practically destroyed the Persian fleet in the strait between the island of Salamis and Attica. A land battle at Platæa and a naval engagement at Mycale, in 479 B. C., forced the final withdrawal of the Persians from Greece.

After Alexander's Conquest. One hundred and fifty years later the Persian empire yielded to Alexander, and at his death in 323 B. C. the greater part of it came under the family of the Seleucidæ. The Parthians ruled it for a time, until the dynasty of the Sassanidæ restored a large degree of Persian power about 226 A. D. This new Persian kingdom was long the chief foe of the Byzantine Empire. In the 7th century the Mohammedan conquests engulfed Persia; between the 11th and the 16th century the land was held by various dynasties of the Seljuk Turks and the Mongols. From 1501 to 1722 the Sufi dynasty, a native Persian family descended from the ancient Sassanidæ, ruled Persia. In the 18th century an Afghan dynasty ruled Persia.

Modern Persia. Modern relations with Russia and Britain began in the 19th century, and the conflict of foreign interests injured Persia's development. In 1906 the first national assembly met and a short-lived constitution was granted.

An Anglo-Russian treaty in 1907 divided Persia into three "spheres of influence," the north to be Russian, the southeast, English, the remaining section to be neutral. The finances of the country were chaotic, and in 1911 Mr. Morgan Shuster, an American, was selected to take control. His vigorous administration of eight months resulted in his dismissal under pressure from Russia. Anarchy increased, and at the opening of World War I, although Persia was neutral, German agents fomented uprisings. A British force was organized in 1916, which did much to restore order.

In 1919 Persia made a favorable treaty with Great Britain. In 1921 she repudiated it, and made a more favorable treaty with Russia. A constituent assembly, in 1925, placed the government in the hands of a hereditary shah. In 1935 the name Persia was officially changed to Iran.

In World War II Iran became important as a corridor through which Britain and the U. S. could send munitions to Russia. Iranian oil deposits were also significant. By the Tehran agreement, Britain, Russia, and the U. S. guaranteed the independence of Iran.

In 1946, the Russians attempted a takeover by setting up a puppet regime in the Azerbaijan region, but it was forcibly driven out. In 1951, under the leadership of Mossadegh, the legislature voted to take over the Anglo-Iranian oil industry, which provided a large proportion of governmental revenue. This led to a break of diplomatic relations with Britain and a cessation of oil exports. After three years, Mossadegh's party was overthrown, and a new contract was made with foreign oil companies. Shah Mohammed Reza Pahlavi, who assumed the throne in 1941, regained full control after Mossadegh's downfall. The Shah's programs of evolutionary reform, called the "white revolution," have slowly modernized the country. Iran again nationalized foreign oil interests in 1973 and has been a leading member of the Organization of Petroleum Exporting Countries (OPEC).

PHILIPPINE REPUBLIC

The Republic of the Philippines occupies a group of islands, lying off the eastern coast of Asia, extending from Formosa to Borneo. Discovered by Magellan in 1521, they remained a Spanish colony for over three centuries, and then became an American dependency for nearly 50 years. In 1933 an act of Congress provided for their independence, after a ten-year transition period, as the Philippine Commonwealth. On July 4, 1946, the islands, with Manuel A. Roxas as their first president, became independent, although closely connected by treaties and economic relations with the United States.

Immediately after independence, the government was confronted by jungle warfare conducted by partisans of the Communist party, and this was put down only after several years of conflict. In 1957, under President Carlos Garcia, the Communist party was outlawed. During the early 1960's, the Philippine Republic was a leader in the efforts to unify the countries of the Southeast Asia area.

Ferdinand Marcos was elected president in 1965. With an increase in guerrilla activity, martial law was imposed in 1972. Under a new 1973 constitution, Marcos appointed himself prime minister. Martial law continued into 1976 with wide opposition.

PHOENICIA

Phoenicia comprised a strip of land about 120 miles long and hardly more than 12 miles wide, between the Lebanon mountains and the eastern shore of the Mediterranean. The Phoenicians were probably a Semitic people related to the Hebrews.

Our earliest acquaintance with Phoenicia comes through records of Egyptian control from 1600 to 1300 B. C. The city of Sidon then became powerful and withstood the advance of the Israelites. Tyre assumed leadership about 1250 B. C. and held it for nearly 400 years. Hiram, king of Tyre, furnished Solomon with ships, workmen, and building materials.

The forests of Phoenicia supplied excellent wood for shipbuilding, and its coast furnished good harbors. Under these conditions, with the smallness of the country, the Phoenicians became the greatest sailors and traders of the ancient world. They supplied ships to Egypt, and Phoenician vessels and sailors made up the sea forces with which Darius and Xerxes attacked Greece. It is probable that there

were Phoenician colonies on the Ægean islands as early as 1500 B. C. By 1100 B. C. Phoenician ships had passed Gibraltar, and the coasts of Europe and Africa were dotted with colonies and trading posts.

Phoenician traders brought tin from Cornwall in England, silver from Spain, linen from Egypt, and copper from Cyprus. Phoenician mechanics knew how to work the metals skillfully and how to dye cloth in the purple hue so highly prized among the ancients, while Phoenician scholars gave to the Western peoples a simplified alphabet.

Assyria broke the power of Tyre in the 9th century B. C. Control by Egypt and Babylon followed, and under the Persians Tyre became important again as the center of their sea power. After a siege in 332 B. C., in which Alexander captured Tyre, the history of Phoenicia ended.

POLAND

Poland was an important kingdom of Europe, with its capital at Krakow from about 1320 to the reign of Sigismund III (1587–1632), when it was removed to Warsaw. At the period of its greatest extent, previous to 1660, it had an area of about 375,000 square miles, extending northward to the Baltic Sea and the Gulf of Riga, westward to Brandenburg, southward to Hungary and almost to the Crimea, and eastward throughout most of the basin of the Dnieper.

Poland was a state of much influence and promise until it was weakened by serious factional troubles in the 18th century and fell a prey to the more powerful neighboring states of Russia, Prussia, and Austria. In 1772, 1793, and 1795 occurred the three successive partitions of Poland whereby all the territory of the kingdom was divided among these three great powers.

At the outbreak of World War I in 1914, about six-sevenths of this area was comprised in Russia, including Russian Poland, Lithuania, Volhynia, and a major part of Little Russia, Livonia, and Courland. The portion of Poland which belonged to Austria comprised the crownland of Galicia. The portion belonging to Prussia comprised Posen, West Prussia, and Ermland, in what is now known as East Prussia.

In November 1918 the independence of Poland was proclaimed at Warsaw, and the powers signatory to the Treaty of Versailles guaranteed the independence of the new state, within the limits of the 18th-century Polish Commonwealth. The success of Polish claims at the Paris peace conference was due in no small part to the diplomacy of the pianist Paderewski, who became the first prime minister. Poland attacked Russia in 1919 but in turn was invaded in 1920 by Russian forces, which were turned back with French aid when near Warsaw. The Treaty of Riga, in October 1920, terminated hostilities and increased Poland's territory by about one-third at the expense of Russia. An insurgent Polish army seized Vilna, the capital of Lithuania, in 1920. It later withdrew, but the city was reoccupied by Poland in 1922 after a plebiscite favorable to Poland and was awarded to her in 1923 by the League of Nations. A republican constitution was adopted in 1921. General Pilsudski, the hero of the war with Russia, made himself dictator in 1926. On his death in 1935 a new constitution was adopted. World War II, which began with Hitler's invasion of Poland in 1939, resulted first in a new partition by Germany and Russia, and second, in a partially reconstituted Poland, augmented by a slice of East Prussia but existing since 1945 as a Soviet satellite.

Wladyslaw Gomulka came to power in 1956, in the wake of bloody strikes in Poznan. Gomulka denounced Stalinism and bettered relations with the Catholic church. In 1968, there was a wave of antisemitism, in which 15,000 Jews were driven into exile. By the end of 1970, economic crises, riots in Baltic cities, and strikes suppressed by police in Gdansk and elsewhere, forced Gomulka's resignation and brought to power Edward Gierek, a close follower of the Soviet line. Gierek and U. S. President Ford exchanged visits in 1974 and 1975. The ensuing negotiations helped to better U. S.-Polish relations.

PORTUGAL

The Portuguese people are descended originally from the ancient Iberians, who occupied the country when Carthaginian and Greek settlers appeared on the west coast of the Iberian peninsula. The Romans conquered the country, and they were followed by the Visigoths and the Moors.

At the end of the 11th century, Portugal, then called Portucalia from the old Roman name of Oporto, *Portus Cale*, was an obscure fief of the kingdom of León. In 1095 Alfonso VI gave this fief to Henry of Burgundy, one of the northern adventurers who came to Spain to fight the Moors. Henry extended the boundaries of his realm, and his son, Alfonso I, became the first king of Portugal. Within the next two centuries, despite wars with the Moors and opposition from the pope, the boundaries of the kingdom were extended to their present limits, and Portugal became a power in Europe. The 13th century saw the end of war with the Mohammedans, and an era of prosperity and organization of government began in the 14th century. King Ferdinand, who came to the throne in 1367, was successful in correcting the abuses of the corrupt court and making war with Spain. On his death in 1383, the legitimate Burgundian line ended. In 1385 John I was chosen by the Cortes. His reign is notable for beginning the series of explorations inaugurated by his son, Henry the Navigator.

The voyages of Portuguese sailors led to the building of a great commercial empire. Portugal secured possession of Madeira and the Azores, a part of Morocco, the Cape Verde islands, and the Guinea Coast. At the close of the 15th century, Vasco da Gama discovered the route to India by way of the Cape of Good Hope. The opening of the 16th century saw the establishment of Portuguese settlements in Brazil, India, Malacca, and the Sunda islands. Portugal then ranked as one of the strongest European states. But her decline was at hand, and was hastened by policies of bigoted oppression and tyranny at home and in the colonies. The Jews, who controlled the wealth of Portugal, were expelled, and other emigration weakened the state. In 1580 Philip II became king of Portugal, and the country was the victim of his imperial schemes.

Portugal's friendship with England brought her into the wars following the French Revolution. In 1807, at the approach of Napoleon, the regent, Prince John, transferred his government to Brazil. He returned to Portugal in 1821, although he had reigned as king of Portugal and Brazil since 1816.

The 19th century was a period of almost continual struggle between the party of absolute monarchy and the friends of constitutional government. The reign of Carlos I, which began in 1889, was a period of demoralization. He and his son, the crown prince, were assassinated in Lisbon, Feb. 1, 1908. Prince Manuel came to the throne, but in 1910 he was deposed. A republican government was then set up, which survived several stormy crises but was at length overthrown by a military *coup d'état* in 1926.

In 1932 Oliveira Salazar became premier and soon after assumed dictatorial powers. Portugal remained neutral in World War II but joined NATO after the war. Salazar retained firm control over the affairs of Portugal until 1968, when he became ill and was forced to resign. He was succeeded by Marcello Caetano who continued Salazar's policies. In 1974, a bloodless military coup ended more than 40 years of civilian dictatorship and 2 years later the first free parliamentary elections in over half a century took place. Ramalho Eanes was elected president and he appointed Mario Soares premier. A new constitution which committed future governments to socialist principles was also adopted in 1976.

PROVENCE

Provence (*prô'vāNs'*) is the district of southeastern France which corresponds roughly to the ancient Roman province, *Provincia Romana*, whence the name. This province was organized in the 2d century B. C., after the Greek city of Massilia (Marseilles) had appealed to the Romans for protection against the invading Ligures. In the first four Christian centuries the province was the seat of a rich and cultured life which centered at Arles and Marseilles. Many interesting remains of this Roman period, such as the theater at Arles, are still preserved. Provence was the field of the conflict between Cæsar and Pompey, and between the Franks and the Saracens. It became a part of France under Louis XI. In the 12th and the 13th century Provence was the seat of a splendid poetic literature, and the Provençal dialect still persists, in both speech and writing.

Rhodesia. See *Government and Politics*.

ROME

The Roman Empire was built on the foundation of a strong local state in Italy. The geography of the peninsula and its ethnographic condition in the early period would scarcely have led us to predict a united Italy. The peninsula is not compact, but long and narrow. The Alps with their many easy passes set up no barrier to the north; a long coast line and frequent harbors along the southern coasts tempted immigrants from overseas. When recorded history begins, then, we are not surprised to find Italy occupied by six or seven peoples of entirely different racial stocks. The most important of these peoples were the Italians, who had entered the peninsula by a land route, and the Greeks and Etruscans, who had come by sea. The Etruscans held north central Italy; the Italians, the central and southwestern part of the peninsula; while the Greeks settled along the southern coast. The factors which gave unity to Italy and in the end made Rome mistress of the Western world were: the sturdiness of the Italic peoples; the strength of their compact political organization, when pitted against the lack of political unity which their principal rivals, the Greeks and Etruscans, showed; the convenient position of Rome near the center of the peninsula and on a navigable river; and the position of the broad fertile strip of Italy west of the Apennines, with the more important harbors on the western coast.

The Latin People. The people who were to build the Roman state were tribes of Indo-European stock, who very early descended through the Alpine passes into the valley of the Po and thence spread into the highlands of the East and the plains of the West and South. The tribes who occupied *Latium*, or the "flat lands" to the south of the Tiber, were the Latins, a hardy race. They were neighbors of the Etruscans, who lived north of the Tiber. From these people the Latins acquired many of the arts of civilization, but they were at the same time forced to defend themselves against the encroachments of the Etruscans and against the Sabines, a highland people in the upper valley of the Tiber. Perhaps it was this situation which brought about the formation of the Latin League, a union of several settlements whose peoples met annually at the town of Alba Longa, where there was a temple of Jupiter. His worship brought the tribes together.

At a ford of the Tiber, near the Palatine mount, was an ancient market, where the Latin peasants came to purchase the wares of the Etruscan merchants. Here the rude Latins had their first glimpse of the civilization and industry of the East, for the Etruscans did business with Greek and probably with Phœnician merchants. By this route too the alphabet may have come to the Latins, as they learned to spell out the accounts and invoices of traders. The earliest settlement to which we may properly give the name Rome was made on the Palatine and the neighboring hills, with its stronghold on the Capitoline. Recent excavations carry the foundation of the city back to a very early date; the Romans fixed 753 B. C. as the year of its founding, and they dated events from that year. The population of the early city was probably made up of Latins, Etruscans, and Sabines, but the Latins predominated.

The Early Latin Republic. For a time this Latin state was ruled by kings, assisted by a council of old men (*senes*), or a senate, but toward the close of the 6th century B. C. the monarchy was displaced by a republic. At the head of the state were two consuls, elected for a year. In an emergency, supreme power was sometimes granted to a single official, who was called a dictator. The two annually elected officials were chosen from among the patricians, as the governing class was called, and they did not treat the plebeians, or common people, fairly. With the establishment of the republic, therefore, began a struggle on the part of the plebeians to compel the patricians to grant them a share in the government. This contest lasted for more than two centuries. The first step in the progress of the plebeians was the election of tribunes of the people. The persons of these officers, ten of whom were elected annually, were declared inviolate, and they were given the power of vetoing any act of a magistrate that seemed to bear too hard upon a citizen. A long step toward securing the rights of the average citizen was taken in 449 B. C., when the laws, which previously had been known to the priests only, were codified, engraved on twelve bronze tablets, and set up in the Forum where they could be read by anyone. In course of time, these laws were developed into a system which has proved one of the richest legacies left to the world by the Romans.

By the middle of the 3d century B. C., the plebeians had won the right to hold the highest offices of the state and had attained equality with the patricians before the law. The republic was really what the words *res publica* implied,—an "affair of the people." Yet the popular assembly never had the right of discussion. It could only vote *yes* or *no* upon measures proposed by the magistrates; debate was reserved to the Senate, which, throughout the period of the republic, in the main, guided the state wisely.

Besides the tribunes and consuls, ancient Rome had also prætors, who served as judges; quæstors, who had charge of the treasury; and censors, whose business it was originally to take a census of the people and assess the taxes. The office of censor grew in importance, and after a time the censors assumed the power of expelling senators for immorality and of depriving citizens of their votes because of misconduct. These offices are interesting, not only for their original character in the republic, but also because the Roman emperors acquired their power by assuming the functions of some of them, and because the old Roman titles appear frequently in modern history, as in France and in the Latin states of South America.

Growth of the Roman State. The task of the Senate and the consuls in the growing Roman state was not an easy one. While the struggle for democracy within the republic was going on, constant warfare was the price of safety from attacks by the Etruscans and the neighboring highland tribes. In the midst of all this, the Gauls, in the early part of the 4th century, captured and burned the city of Rome. But when this danger had passed, the Roman armies pursued the business of conquest until, by the year 338 B. C., when Greece was surrendering her freedom to Philip of Macedon, Rome was supreme in Latium and had extended her power over southern Etruria. The beginning of the 3d century B. C. saw her victory over the Samnites in the South, and, in 264 B. C., Roman arms had triumphed over the Greek cities in the extreme

South, or Magna Græcia. Italy was united, from the Strait of Messina on the south to the Arno and Rubicon rivers on the north.

Citizenship and Colonies. A new problem in government now presented itself to the Romans. The idea of citizenship was at this time confined to residence in Rome or the nearby territory. All elections were held in the city, and election days were numerous. Consequently, even those who held Roman citizenship but lived at a distance from Rome found attendance upon elections impossible. It thus came about that, even while Roman conquests were confined to Italy, elections and legislation were controlled by the Roman populace. This defect in the Roman system was never wholly corrected, and it led to grave evils. It might have been remedied by the introduction of a representative system. This concession, however, the city of Rome was unwilling to make. But immediate trouble was avoided by allowing the conquered peoples to manage their own local affairs, and by demanding only that they should furnish soldiers for the Roman armies in time of war. The loyalty of the new territory in Italy was secured by the planting of Latin and Roman colonies at various points. The Latin colonists were mainly poor plebeians and veterans who wanted their own farms. Although possessing the private rights of Roman citizens, they had not yet acquired the right to vote and hold office, whereas these rights and privileges were possessed by the members of the Roman colonies, who were able to exercise political power by going to Rome. Both classes of colonies, however, were loyal to Rome and served to spread Roman customs and the Latin language throughout Italy. Moreover, what was quite as important as anything else, the agricultural development of the land was assured through these farmer settlements.

These colonies were connected by splendid roads, which served both as a means of rapid military movements and, since they were free to the public, as arteries of trade and routes of travel. In later centuries this admirable system of roads was extended throughout the empire, from Britain to Asia Minor, and so well were the highways built that many stretches of them are even now in good condition. By such means, the people of Italy were brought to feel their national unity, even though they belonged to many separate tribes and spoke widely differing dialects and languages.

The long wars which had resulted in making Rome mistress of Italy had developed the Roman citizen army into a military machine of wonderful efficiency. The basis of it was the legion, in which all citizens from 17 to 46 years of age were liable to service. Added to this was a body of auxiliaries, recruited from the subject states. The severe discipline of these troops, their open order of fighting, and the skillful use of reserves carried the Roman standards to victory.

Rome and Carthage. Such was the preparation of the Roman state for its life and death struggle with its greatest rival, the commercial Carthaginian power. The first stage of this long contest was the fight for Sicily, begun in 264 B. C. The Romans remedied their one weakness, lack of sea power, by building a navy, with which in 241 B. C. they won a complete victory. During the next twenty years they prepared for a second contest by subjugating the Gauls in the Po valley and by seizing Sardinia and Corsica, while the Carthaginians were making good their losses by developing the resources of Spain. In the summer of 218 B. C. the Carthaginian commander, Hannibal, carried the war into Italy by successfully leading his army from Spain through Gaul and over the Alps. At first the rapid movements of this great captain took the Romans by surprise. They appointed Quintus Fabius Maximus dictator. He earned the title of "delayer" through his policy of avoiding a direct conflict until he could drill his troops. The Romans were impatient of delay, and the new consuls of 216 B. C., yielding to the popular demand for speedy action, joined battle with the numerically inferior force of Hannibal at Cannæ. They were disastrously defeated, and 35,000 of the 50,000 men who made up their army were killed or captured. For nearly fifteen years Hannibal maintained himself in Italy with forces inferior to those of the Romans, but he failed to arouse the Italians to revolt, and when, in 202 B. C., he was summoned to Africa, which Publius Scipio had invaded after driving the Carthaginians from Spain, he was defeated on the field of Zama. Carthage became a dependent ally of Rome, and Rome's political supremacy was assured.

But Carthage still remained a dangerous rival of Rome. For fifty years the Romans watched the city's growth and then determined to destroy it. In 146 B. C., after a heroic defense of three years, an adopted grandson of the conqueror of Zama carried out the order of the Senate to burn the city and declared its site accursed.

The difficult task of subjugating Spain was completed in 133 B. C., and all of the peninsula except the mountainous northwest part became gradually and thoroughly Romanized; a few years later the strip of southern Gaul, or France, which connects Italy with Spain, was made Roman territory. In 121 B. C., Rome had conquered Italy and the adjacent islands of Sicily, Sardinia, and Corsica, southern Gaul, Spain, and northern Africa. In other words, she was mistress of the western Mediterranean. In the eastern Mediterranean, Rome became involved in quarrels with Macedonia and Syria in the early part of the 2d century, and by 133 B. C. she had annexed Macedonia and the western portion of Asia Minor.

Economic Problems. As the domain of the republic became imperial in extent, it appeared that the old plan of making allies and citizens of conquered tribes, which had worked so well in Italy, was difficult to apply on distant and barbarous frontiers. Rome, therefore, began the policy of making provinces of the conquered lands outside of Italy, and of requiring them to pay tribute. The result was that these provinces were, in many instances, treated as mere opportunities for plunder. But the consequences of the vast influx of wealth from this new territory to Rome were even more disastrous for the city than for the provinces. The gulf between the rich, to whom the power and wealth of conquest went, and the citizen farmers, who fought the battles, became wider. Cheap wheat from the new provinces flooded the market of Italy, and the small farmer was forced to sell his land to the great landholder who could work it with slaves. These landless folk flocked to Rome, and they, with the quickly enfranchised slaves, who had been brought in great numbers to Italy as a result of the long wars, made up the Roman mob which was to be for centuries a constant menace to the peace of the city. Thus, while the richer classes of Italy were appropriating the wealth of the Mediterranean world and assimilating the culture of Greece, a difficult social problem arose in the state.

The Gracchi. The first serious attempt to meet this situation was made by the tribune Tiberius Gracchus, in 133 B. C. He proposed that the government should reclaim from the great landlords a part of the public lands and divide it into small holdings to be given to poor citizens. He even wanted to use public funds to stock these little farms. Tiberius at length secured the passing of a law covering these points, but the violent means used by him, added to the hatred aroused by his plan among the rich landholders, brought about his assassination and the repeal of the measure. Ten years later, Gaius Gracchus, the younger brother of Tiberius, was elected a tribune of the

people. The means he took to carry out the reforms which he had in mind combined good and bad elements. His first move was to secure a law permitting sale of grain from the public storehouses to citizens at half the market price. This led directly to plain charity and disaster. but it gave Gaius the political support of the needy. He then projected a system of roads and began a policy of establishing colonies of poor citizens in the provinces. Here were the beginnings of wise policies, but the next measure proposed, although equally wise, proved his undoing. He wanted to bestow citizenship upon the people of the Latin colonies. But the Roman populace saw in this a possible curtailment of their privileges. They refused to re-elect him to the tribunate, and he was killed in an ensuing riot.

The Movement toward Monarchy. The work of the Gracchi had begun the revolution that was finally to make one man supreme in the Roman state. One element of weakness in their plans lay in their entire dependence upon the fickle, ignorant, selfish Roman populace. Later, men with trained legions at their command were able to master the mob and use it for their own purposes.

At the beginning of the 1st century B. C. the struggle between the aristocracy and the democracy centered around Marius and Sulla. Marius was of peasant birth, but his military ability, signalized in his victory over Jugurtha in Africa, in 105, and over the Germans, in 102 B. C., gave him great influence with the people. Sulla was a noble, who won his early military honors in the Social war (90-88 B. C.), a contest through which all Italians won Roman citizenship. Later he carried on a successful war against Mithridates in Syria. While he was in the East, the democratic faction, under Marius, was supreme in Rome, where it carried out a campaign of terror against the aristocrats. Marius died suddenly, and Sulla returned to defeat the democrats and wreak a bloody vengeance on their leaders. He ruled as "Perpetual Dictator" for three years.

The next stage in the march of the Roman state toward monarchy was marked by the ascendancy of Pompey, a friend of Sulla. He had won military laurels in Spain, in campaigns against the Mediterranean pirates, and in the final subjugation of Mithridates. He annexed Syria to the Roman domain and returned to Rome in 62 B. C. Three other men were also to be reckoned with in Rome. They were men of different types. Cicero was the leading lawyer of his day, champion of the Senate and of the traditions of the republic. Julius Cæsar was a young politician, popular with the masses because of his oratory and his lavish expenditure for public shows. When his own fortune was exhausted, the wealthy Crassus came to his aid. Cæsar and Crassus made a private compact with Pompey, known as the First Triumvirate. They were masters of Rome. But Cæsar was more daring and able than his colleagues, and fortune favored him. While he was engaged in the conquest of Gaul, Crassus met defeat at the hands of the Parthians at Carrhæ in Mesopotamia.

Julius Cæsar. Pompey, fearful of Cæsar's ambition for despotic power, now sided with Cicero and the Senate. Cæsar was summoned to return to Rome without his army; his reply was the crossing of the Rubicon with his troops. Taken unawares, Pompey, with what forces he could collect, withdrew to Greece. Cæsar, after a brief campaign in Spain, followed and defeated him at Pharsalus in 48 B. C. Two years sufficed to subdue revolts in Egypt, Asia, and Africa. In 46 B. C., Cæsar returned to Rome. He now began a series of wise political and economic reforms. He struck at the worst abuses of public charity, reformed the system of tax collection, planned foreign colonies for landless Italians, and began the extension of Roman citizenship. But his political and personal enemies formed a conspiracy against him and brought about his death in 44 B. C.

The Rise of Octavius. Then followed a desperate struggle for power between the senatorial party, led by Cicero, Brutus, and Cassius, and the opposition, under the Triumvirs,—Antony, Octavius, and Lepidus. The battle of Philippi, in 42 B. C., put an end to the hopes of the senatorial oligarchy and the republicans. Of the three new masters of the Roman world, Lepidus, a weak man, quickly dropped out of sight; Antony was defeated at Actium, and the reins of power came into the hands of Octavius. But Octavius took care that the old governmental forms should be preserved. The Senate gave him the title of *Augustus*, "the majestic"; he called himself *Princeps*, "the first citizen"; his command of the army carried the title of *Imperator*, "commander." Here are the origins of modern royal titles, to which we may add Octavius' family name of *Cæsar*. Augustus, as he is known, held the tribunate, which gave him large authority in Rome, and he had the proconsul's power on the frontiers and in the provinces. In this way the new government was linked with the old.

The Early Empire. The reigns of Augustus and his successors to the year 180 A. D. cover the period of the Early Empire, the time of Rome's greatness. Except on the frontiers of the empire, the reign of Augustus was a period of general peace. The emperor gave his personal attention to the problems of ruling. He made the Rhine the boundary of the empire on the north; the Euphrates, on the east. He built splendid structures in Rome; he constructed long stretches of roadway in the provinces; and he made life and property more secure throughout the empire.

With few exceptions, the emperors of the first two centuries were able men, great builders, and strong administrators. The list includes Claudius, Vespasian, Trajan, Hadrian, and Marcus Aurelius. In the reign of Claudius the conquest of Britain was begun, a difficult task, which was not completed until the end of the 1st century A. D., after which time, for 300 years, Britain was a Roman province. Vespasian rescued the Roman state from the anarchy which threatened after the death of Nero. During his reign, his son Titus captured Jerusalem, 70 A. D. Trajan, one of the so-called "good emperors," pushed the frontiers of the empire to their extreme limit, but his conquest of the Tigris-Euphrates valley was abandoned by Hadrian, who found the difficulties of administration too great in so distant a province. With the reign of Marcus Aurelius, the philosopher-emperor, the barbarians began to show the growing strength that was at last to break through the Roman barriers.

Civic Life in the Empire. But the real story of this great period is to be read in the traces of Roman life that still remain in all parts of the wide territory that became the home of the Roman citizen. Massive and beautiful ruins of cities in Syria, in Dalmatia, in Africa, Spain, France, Germany, and England testify to a wealthy and luxurious civilization that appropriated the traditions and genius of its predecessors in sculpture and architecture. The rich commerce which sustained this civilization entered splendidly improved ports and passed over a vast system of paved roads. In hundreds of free, self-governing cities a vigorous political life developed, which left to medieval and modern times a lasting tradition of free local government. In these cities the industries were carried on largely by free workmen who were organized in guilds. Art and literature were cultivated, and the Latin language became the common tongue of the Western world. Roman law was supreme and became the basis of the modern legal systems of western Europe. With all this greatness, however, there grew up the

Augustulus was deposed and banished by Odoacer, who thus put an end to the line of Western Roman emperors.

social, political, and religious evils that accompany the rise of a luxury-loving society. Wealth was concentrated in the hands of a few. Cities grew at the expense of the country, and their citizens were divided into the very rich and the very poor.

The Later Empire. The period of the Later Empire extends from the year 180 to the year 395, when, on the death of Theodosius, the empire was divided. The first half of this period was marked by civil wars provoked by the strife of rival claimants for the imperial throne. Emperors were made and unmade by the legionaries from Rome or the provinces. This internal trouble was made more serious by the constant attacks of the northern barbarians and the Persians. Diocletian (284–305 A. D.) undertook to reorganize the government. He associated with himself a trusted officer, Maximian. Each was called *Augustus* and had all the honors of emperor. Diocletian ruled the East; Maximian, the West. Each *Augustus* selected a younger associate, or *Cæsar*, to aid him. The civil and the military authority were separated, and the empire was divided into more than one hundred provinces. By these means, Diocletian hoped to hold in check ambitious aspirants for the throne. His system prolonged the existence of the empire, but along with it went absolutism and all the old strife as to the succession.

Constantine, a man of ability in war and statecraft, became sole master of the empire in 324. He made his reign of thirteen years memorable by the recognition of Christianity and by moving his capital to the ancient Greek town of Byzantium, which became Constantinople, or the "city of Constantine." Both of these acts were founded upon good reasons of state. Byzantium was a better military center than Rome from which to repel the barbarian attacks, and it was well adapted to connect the eastern and western halves of the empire.

The death of Constantine, however, was the signal for another period of disorder in the empire. The barbarians were crowding in along the Danube and the Rhine, and the interests of the eastern and western parts of the empire were driving Rome and Constantinople farther apart. The slave system and childlessness sapped the vitality of the population. The Roman armies lacked free men. Expenses of government increased faster than revenues. The Roman Empire faced bankruptcy.

Rise of Christianity. Christianity, the latest of the religious faiths to come out of the East, in its principles and practice was not in perfect harmony with the religious and social conditions of the time. The Christians refused to worship the emperor or to share in any of the customary pagan rites. Their conduct brought many years of persecution until at last the emperor Constantine himself accepted Christianity. Slowly the new faith triumphed inside the empire over the old paganism and the newer Oriental faiths, such as the popular cult of Mithra. Christian missionaries had made converts among the Germans, so that the Roman world passed to their hands with less disturbance than otherwise would have occurred.

Germanic Invasions; Fall of Rome. A peaceful mingling of Romans and Germans was going on along the Danube, when the Huns suddenly appeared. The Germanic Visigoths were allowed refuge on the Roman side of the Danube. Here Roman officials robbed and persecuted them until they revolted. At the battle of Adrianople in 378 A. D. they overthrew the emperor Valens and his legions. They had now learned their power, and after the death of Theodosius in 395 the great Gothic invasion of Greece and Italy began. In 410 the Goths captured the city of Rome itself. Four years earlier a vast body of Germans had crossed the Rhine. A few years later (429–439) the Vandals conquered North Africa, and by the middle of the century the Angles and Saxons were masters of Britain, while the Franks controlled Gaul. The Huns were beaten back at the battle of the Mauric plains in 451 by a union of Romans and Germans. But in 455 the Vandals sacked the city of Rome. The government of the West by the Romans was now a thing of history. German officers made and unmade puppet emperors. The last claimant to the imperial throne was the boy, Romulus, nicknamed *Augustulus*, "the little Augustus." He was dethroned, and the German troops made Odoacer king. The date of his accession is sometimes taken to mark the end of the Roman Empire in the West, but no line can be drawn to mark the end of the old world and the beginning of the new. The new rulers of Italy, of Gaul, and of Spain still thought of their authority as coming from Rome. Roman law was followed, and the Latin language was still spoken for many centuries throughout the West.

RUMANIA

Rumania (*rōō-mā'nĭ-ȧ*) is a kingdom of southeastern Europe, bordering on the Black Sea. In ancient times this country was peopled by the Dacians, who were conquered by Trajan about 101 A. D. Roman colonists were introduced, and Dacia was made a Roman province in 106. As an outpost of the empire, Dacia was for several centuries a battleground of invading barbarians. Toward the end of the 13th century the principality of Wallachia was founded, and about the middle of the 14th century, Moldavia. In the 16th century both of these principalities were forced to acknowledge Turkish sovereignty. In 1861 they were united under the ancient name of Rumania. Prince Alexander John Cuza was chosen as head of this union. He introduced several reforms, but his despotic methods forced his abdication in 1866. Prince Charles of Hohenzollern was then elected. The independence of Rumania was recognized by the Congress of Berlin in 1878, and in 1881 the country was made a kingdom. Rumania is an agricultural country, with rich soil and fine grazing lands. Ownership of land has been one of its political problems.

Rumania took no part in the first Balkan war in 1912-13, but she secured additional territory through the second Balkan war of Serbia, Greece, and Rumania against Bulgaria. In 1914 Ferdinand became king on the death of his uncle. Rumania was drawn into World War I on the side of the Allies, and defeated. She was compensated at the peace with territory taken from Russia and Hungary.

King Ferdinand died in 1927. His son Carol had renounced his claim to the throne, which was conferred on Carol's infant son Michael. Carol seized the throne in 1930. In 1940, Rumania was forced to cede Bessarabia and northern Bukovina to Russia, a part of Transylvania to Hungary, and southern Dobruja to Bulgaria. Carol was again deposed in 1940. Prince Michael was proclaimed king with a pro-German ministry, and Rumania joined the Axis powers, sent contingents to the German army invading Russia, and occupied Odessa. When the Russian counterattack reached Rumania, in August 1944, Rumania promptly changed sides, and a pro-Communist government took office. It was recognized by Great Britain and the United States on promises of free elections and liberty of speech and press. These promises were not kept and the protests of the two countries were disregarded. Rumania signed her peace treaty, September 15, 1948, receiving back the territory she had formerly seized from Hungary, but not that taken by Russia. King Michael abdicated, December 30, 1947, under Communist pressure, and a "People's Republic" was proclaimed. By 1948 Rumania was completely under Russian control, economically and politically. The opposition was liquidated, and an attack on the Catholic Church began.

By 1958, the Rumanian government had persuaded the Russians to withdraw all Russian troops from Rumania. In 1966, Rumania boldly urged decentralization of power in eastern Europe.

History

The story of Russia begins with the coming of the Norseman, Rurik, with a body of followers, to Novgorod in 862 A. D. The Norsemen, or Varangians, set up an orderly government among the warring Slavic tribes and, moving southward to Kiev, opened the country to trade and to the influence of Mediterranean civilization. By the middle of the 10th century, the Norsemen and the Slavs had become thoroughly united. One must not, however, judge that the Norsemen were more than a very small minority. Their influence helped the formation of early Russia, and even named the country, but the native race and culture always predominated. Under Vladimir the Great, Russian authority was extended in all directions. Vladimir was converted to Greek Christianity, and in 988 he and his followers were baptized.

The Tatar Conquest. During the next two centuries, Russia was a field of conflict among petty states. The land was therefore an easy prey to the Mongols in the 13th century. Despite the heroic resistance of the Russian princes, the superior numbers and generalship of the Mongols enabled them to take complete mastery of Russia in 1238. This Tatar conquest cut Russia off from contact with the Western nations of Europe for 300 years; the Renaissance and the Reformation, which remolded the rest of Europe, she did not share in. The conquerors appear to have been content to exact tribute from Russia. They did not interfere seriously with the language or customs of the Russians, but nevertheless they introduced many Oriental elements into Russian life.

The 14th century saw the rise of the principality of Muscovy, with its capital at Moscow. This state attained a position of supremacy among the Russians in the 15th century, and the grand prince, Ivan the Great (1462–1505), united the rival principalities and threw off the Tatar yoke. Under his son, Ivan the Terrible, the boyars, or nobles, were reduced to submission, western Siberia was conquered, and trade with England was opened up. Ivan took the title of czar. After the death of his grandson, Feodor, a long period of strife resulted in the choice of Czar Michael Romanov, the first of the dynasty that ruled until 1917.

Peter the Great; Catherine II. Modern Russian history begins with the accession of Peter the Great in 1689. He was a man of restless energy, and he attempted to modernize and Westernize Russia by main force. He enlarged his territory, built a new capital, Saint Petersburg, on land taken from the Swedes, and introduced Western industry and customs. After Peter's death, his schemes fell into abeyance until the vigorous and unscrupulous Catherine II came to the throne in 1762. In her reign of more than thirty years, she improved governmental methods, encouraged modern industry, and established schools. She directed the division of Poland and secured the Crimea from Turkey.

Extension of Russian Power. Czar Alexander I (1801-25) opened his reign by freeing the serfs in the Baltic provinces, but he later receded from his liberal position. In 1807 Alexander made the famous Treaty of Tilsit with Napoleon, in consequence of which he was able to take Finland from Sweden in 1809 and to wrest much territory from Turkey. The reign of his successor, Nicholas I (1825-55), was marked by the beginnings of the liberal movement in Russia and by a succession of wars with Turkey. Russian defeat of the Turkish fleet at Navarino in 1827 aided materially the cause of Greek independence. In 1832, after crushing a revolt in Poland, Nicholas began a policy of repression in that country.

Reform; Reaction; Nihilism. The liberal reform movement in Russia received great encouragement from the early policies of Alexander II (1855-81). Serfdom was abolished in 1861. Reforms in the administration of justice were introduced. But the period of vast extension of Russian power in Asia was marked by reaction at home. The government's repressive measures provoked nihilist activity. Alexander was killed by a bomb, March 13, 1881. His son, Alexander III (1881-94), pursued a reactionary policy. Repression of liberals and persecution of the Jews in Russia accompanied imperial policies in Asia. Nicholas II (1894-1917) continued the blind policy of his father. Intervention in the Chinese-Japanese war (1894-95) gave Russia possession of Port Arthur, and absorption of Manchuria followed the Boxer troubles of 1900.

Meanwhile, the large increase of manufacturing in Russia had been adding new elements to the revolutionary forces. The workers learned from Western factory managers and superintendents the superior conditions of their class in other countries. The government had tried to meet this rising tide of revolution by various kinds of paternalistic laws and by stirring up hatred between races in the empire. The trouble reached a climax in 1904 and 1905. The crushing defeat of Russian armies and fleets by Japan had clearly revealed the corruption of the government. In the midst of a series of strikes and riots, a congress of delegates from the zemstvos, or provincial assemblies, met in Petrograd and formulated demands for political and industrial reform. Bloody repression led to an outbreak of strikes in all industrial centers.

The Duma. At length, on October 30, 1905, the czar issued a manifesto which announced the speedy establishment of a representative assembly, the Duma, and real participation of the people in the government. But this announcement was immediately followed by a reign of terror, in which the people, and especially the Jews, were made to feel the iron hand of the autocracy. The first Duma met in the Winter Palace at Saint Petersburg on May 10, 1906. But this body and its successors found the imperial government unprepared to further any genuine reform. The following years, up to 1914, formed a period of virtual deadlock between the reactionary court party and the liberals, who were, by changed electoral laws, virtually excluded from even the Duma.

Upon the outbreak of war in the summer of 1914, the Russian people rallied to the support of the government. For a time the government held out promises of progressive reform, but military successes were accompanied by reactionary programs. When, in the summer of 1915, the government stood in need of popular support, a large progressive party in the Duma demanded a ministry responsible to that body. This demand was answered by a proroguing of the Duma.

Evidence of the same government corruption and traitorous intrigue that had been so disastrous in 1904-05 now began to accumulate. At the same time, the people, providing war supplies and hospitals through their zemstvos and municipal organizations, were learning their strength. The inevitable result was revolution, which broke out in 1917. The czar abdicated, and a government by an executive committee of the Duma was attempted.

The Bolsheviki. A temporary government under Alexander Kerensky, a socialist, was wrecked by the extreme radicals, or Bolsheviki, led by Nicolai Lenin and Leon Trotzky. In November 1917, the All-Russian Congress of Workmen's and Soldiers' Delegates made Lenin the premier, and Trotzky the foreign minister, of the Soviet Republic. On March 3, 1918, Lenin's envoys signed a peace with Germany at Brest-Litovsk. The Bolshevik government was set up at Moscow, and Trotzky, with his armies, proceeded to the task of suppressing rebel-

lion. The avowed purpose of the Bolsheviki to support propaganda for the proletariat revolution in other countries led the Entente Allies and the United States to maintain troops in Russia, to support various anti-Bolshevik movements, and to refuse to trade with the Russians. Eventually all the anti-Bolshevik enterprises collapsed.

The government of Russia was dominated by the personality of Lenin until his death in 1924. Private property and the right to trade were at first abolished by decree, enforced through terrorism by the notorious *cheka*. The peasants, however, who had recently seized the land, had no intention of relinquishing it and refused to raise surplus grain to be confiscated by government agents. Economic maladjustment and widespread famine ensued and led to a so-called new economic policy. Trade was permitted to individuals, but the government remained the chief property holder and trader.

The Third International. Russia's foreign relations were based on the theory of world revolution, the Bolshevik party regarding itself as a branch of the so-called Third International. This organization, formally founded at Moscow in 1919, aimed at fomenting movements in every country that might lead toward a dictatorship of the proletariat. After Lenin's death, Russia continued to foment revolution abroad but greater emphasis was placed on economic development at home. Trotzky, who opposed such temporizing, was exiled and eventually murdered in Mexico, where he had sought asylum.

The revolution introduced drastic social changes, notably a new marriage code based on equality of men and women. Education became universal; students were provided with state support through college and technical school.

Five-Year Plans. In 1928 began a process momentous for Russian life. Under the dominating influence of Joseph Stalin, who had become absolute dictator, the first of several five-year plans of industrialization was initiated. This embraced both agriculture and manufacturing. With a combination of propaganda and ruthless compulsion, individual farming was transformed into large cooperative or state enterprises, huge factories were built, sources of power were developed, and transportation facilities were constructed. The standard of living, however, remained painfully low by western standards.

Such drastic changes entailed suppression of many civil rights, such as freedom to leave the country, and freedom to choose jobs without government consent. Private business was practically abolished. The strain of the process engendered opposition but recalcitrants were "liquidated" in numbers estimated in the millions. Nevertheless, Russia succeeded in building up an image before the world of a country proceeding from a primitive to an advanced economy at one stride.

As Germany under Hitler's dictatorship prepared a war of conquest, Stalin appeared to side with the West. But in early 1939 he and Hitler made an agreement to divide Poland and lay out respective fields of influence. When Hitler began World War II later that year, Russia remained neutral but ready to seize any advantage. In 1942, Hitler attacked Russia, apparently taking Stalin by surprise, and penetrated as far as Moscow and the Caucasus. But with prompt and extensive Western aid, the Russian army rallied. It eventually conquered half of Germany, joining forces with the Western armies. See *World War II*.

Stalin led his allies to believe that he favored a permanent peace settlement, but actually he directed his policy craftily but ruthlessly toward fomenting worldwide communist revolutions, with Russia as the beneficiary. Bulgaria, Rumania, Hungary, Poland, the Baltic states, Yugoslavia, and East Germany became satellites by direct army control, and Czechoslovakia followed in 1948. China, having been taken over by a communist government, was made an ally.

In 1950, Stalin gave the word to have the communistic government of North Korea take over the

non-communistic southern half. But here the United Nations with United States initiative and military power stepped in and administered a decisive check. Yugoslavia meanwhile had gotten rid of Russian army personnel and asserted a measure of independence under its communist dictator, Tito. Stalin failed in attempts to tame Tito.

Stalin died in 1953; his successors, chiefly Khrushchev, slowly relaxed governmental tyranny.

The postwar period was one of rapid, forced industrial development in Russia, with emphasis on heavy industry and military might. The secret of nuclear weapons was soon mastered so that Russia faced America as one of the world's two giant military powers. It forged ahead in prestige by being the first to launch a space satellite. Throwing energy and money into subversive activities abroad and particularly in the numerous new nations that emerged with the dissolution of western empires, it did its utmost to achieve its dream of world preeminence.

But here also Russia was decisively checked. Western Europe, with initial economic aid from the United States, grew rapidly in power and dwarfed Russia and its satellites in economic well-being. Economic aid to emerging nations from the Western powers bested Russian efforts at subversion, even when Russia began to imitate the West in advancing economic aid to them. In the 1960's, the Chinese-Russian alliance began to crack, the two powers hurling insults at each other and competing for the allegiance of new nations. In 1962, Russia made the error of arming Cuba with weapons capable of using atomic warheads. The United States forced their removal by threat of war. Finally, Russia was faced with a food crisis. Agriculture lagged and industrial growth slowed down. In 1964, Khrushchev was deposed and was succeeded by Brezhnev as head of the Communist Party and by Kosygin as premier.

The new government instituted some basic modifications of the old order. The concepts of profit and of supply and demand entered the picture. Efforts began for winning consent from satellites in place of rule by naked force. Talk of world revolution was replaced by that of the need for peace and economic progress.

SAN MARINO

The little independent state of San Marino (*săn mä-rē'nō*), lying in the Apennines near the Adriatic coast in northeastern Italy, is the smallest republic in the world and claims to be the oldest independent state in Europe. The city of San Marino is said to have been founded in the 4th century. In 1631 Pope Urban VIII formally acknowledged the independence of the state, which has an area of about 38 square miles. Undisturbed by Napoleon, its sentimental interest probably saved it from union with Italy in 1860-61.

SAXONY

The name of Saxony was anciently applied to the entire northwestern district of Germany, extending from the Zuider Zee to the present neighborhood of Cassel and Magdeburg. By scattering the Saxons, who resisted bitterly, and by bringing in Frankish colonists, Charlemagne finally subdued the country. In the 10th century, Duke Henry of Saxony became king of Germany, and his son, Otto the Great, was crowned Roman emperor. The territory of Saxony was frequently changed during the following centuries. In 1485 the domain was divided between Elector Ernst and Duke Albert, the latter becoming the founder of the royal house of Saxony, which ruled until 1918. Frederick Augustus III was made king by Napoleon, and Saxony became the scene of Napoleon's struggle with the allies in 1813. In the Austro-Prussian war of 1866 Saxony sided with Austria and was compelled at the close of the war to join the North German Confederation and thus became part of Germany.

SIAM (THAILAND)

Siam (*sī-ăm'*). Its authentic history begins with the year 1350, when the old capital, Ayuthia, was founded. After a Burmese conquest, Siamese forces were rallied by a Chinese leader, Phya Tak, on whose death in 1782 the present dynasty came to the throne.

Under King Mongkut, who came to the throne in 1851, the development of Siam as a modern state began. Between 1855 and 1865, the principal foreign powers obtained the right by treaty to trade in Siam under a 3 per cent tariff, and they established their own extraterritorial courts there. In 1920-26, these courts were abolished by agreements, and the tariff was replaced by a most favored nation clause. Siam was an absolute monarchy until 1932, when King Prajadhipok granted a constitution. Siam changed its official name to Thai in 1939. A military group seized power in 1959 allegedly to combat communist inroads. Various military leaders ruled along with the king until 1973, when a parliament was elected and a prime minister was appointed. During the Vietnam war, the U. S. used Thailand for military bases and supported Thai troops. In 1976, a military junta again took control.

SICILY

Recorded history of the island of Sicily begins with the establishment of the Greek city of Naxos in 735 B. C. This, with other Greek colonies established in the course of the following two centuries, became the center of thriving commerce. From the year 536 B. C. until the period of the Punic wars, Greeks and Carthaginians contended for mastery in the island. In 210 B. C., however, Sicily became the first of the Roman provinces. During the middle ages, Goths, Byzantines, and Saracens in succession held sway. At length, in the year 1090, the Normans made conquest of the land, and Roger II became king of Sicily in 1130. From the close of the 13th century until the Treaty of Utrecht in 1713, Sicily was ruled by princes of Aragon and by the Spanish crown. In 1734, under Don Carlos, the Kingdom of the Two Sicilies arose, uniting Naples and Sicily under a Bourbon dynasty. Garibaldi's bold expedition in 1860 opened the way for the union of Sicily with the kingdom of Italy in 1861.

SOUTH AFRICA

The republic of South Africa consists of four provinces plus South West Africa, which is treated as a province although claimed by the United Nations as trusteed territory. The early history of each is treated separately below.

Cape of Good Hope. The oldest province is Cape of Good Hope, which was first settled by the Dutch in 1642. It remained under the control of the Dutch East India Company until 1795, when it was captured by the English. The British forces evacuated it in 1803 pursuant to the Treaty of Amiens but reoccupied it in 1805 to prevent its capture by the French. England's possession was confirmed by treaty in 1814. Its area was enlarged by annexations later in that century. The colony was granted responsible government in 1872.

Natal. Discovered in 1497 by Vasco da Gama, Natal was settled by the English in 1824 and later by the Dutch Boers ("farmers") from Cape of Good Hope. The Boers declared themselves independent, but the British reclaimed the territory in 1843.

Orange Free State. Boers from Cape of Good Hope in 1835–36 settled in what became the Orange River Colony after the British seized it in 1848. England recognized its independence as the Orange Free State in 1854.

Transvaal. This territory also was settled by Boers from Cape of Good Hope, in 1836–37. England controlled it at first but recognized its independence in 1852 as the Transvaal republic; then resumed control in 1877 because of its financial

difficulties and hostilities with the natives. There was a revolt in 1880, after which the Transvaal was granted independence as the South African Republic. The discovery of rich gold and diamond mines brought a great influx of English settlers, who were far from welcome by Paul Kruger, president of the Transvaal. Incidents of growing seriousness led to the Boer war against England, in which the other provinces joined, 1899–1902. The Boers were eventually defeated. In 1910, the four provinces were united and granted self-government as the Union of South Africa.

During World War I, South Africa supplied troops for European service and also for campaigns against the Germans in Africa. It conquered German South West Africa and was granted a mandate over it by the League of Nations after the war. This course was followed under the first premier, Louis Botha, and his successor, Jan Smuts, under whom South Africa played a prominent part in the British Commonwealth. Under Smuts also, South Africa participated in World War II. Thereafter he was defeated at the polls by Herzog, leader of the National party on a platform of strict racial segregation, known as *apartheid*. In 1961, under a new constitution, South Africa became a republic. Since other members of the British Commonwealth opposed its racial policies, South Africa withdrew from the Commonwealth.

Meanwhile, in respect to South West Africa, then a trusteed territory under the UN, South Africa resisted efforts of the UN to hold it to account. It extended its policies of racial segregation there and treated the territory as a province. Under a new name, Namibia, the country was slated for independence by 1978.

Under the racial policy, only white citizens may sit in Parliament. Black inhabitants have no civil rights in white South Africa and only a few rights in territories reserved for them. These territories, according to government plans, would eventually be autonomous all-black states still under economic control of South Africa. The first such state, Transkei, was set up in 1963. South Africa's policy of white supremacy made it the target of vituperation by black nations in Africa and by most other countries committed to racial equality. On the other hand, its example encouraged Rhodesia to adopt a similar policy. South Africa's prime minister, H. F. Verwoerd, the architect of the racial policy, was assassinated in 1966 and was succeeded by B. J. (John) Vorster.

In the 1970's, as more of Africa came under black rule, the days of exclusive white power in South Africa seemed numbered. The rising anger of blacks within the country produced riots and terrorism in 1976. By 1978, South Africa seemed sure to be surrounded by hostile nations. The government faced either major reforms or armed insurrection.

SPAIN

The original inhabitants of the Spanish peninsula, which was known to the Greeks and Romans as Hispania or Iberia, were probably a primitive race called Iberians. Upon these a host of Celts are supposed to have descended from the Pyrenees. The two races mingled and formed the mixed nation of the Celtiberians. About the middle of the 3d century B. C. the Carthaginians, deprived by Rome of their trading posts in Sicily and Sardinia, began to develop Iberia as a source of wealth and soldiers, and an extensive tract of territory was brought under subjection to Carthage by Hamilcar Barca, who is said to have founded the city of Barcelona.

Roman, Gothic, and Moorish Rule. The Romans had driven the Carthaginians from the peninsula in 206 B. C., and the country was erected into a Roman province. From this time until the end of the 2d century A. D., the condition of Spain was eminently prosperous. Everywhere throughout the country, Roman towns sprang up, and numerous aqueducts, bridges, and amphitheaters were built. Spain was for three centuries the richest province of the Roman Empire. Its fertile grainfields fed the imperial city, and its mines yielded enormous wealth. Many of the leading men of the later empire, in politics, military life, and literature, were natives of Spain.

In 409 A. D. hordes of barbarians, Alans, Vandals, and Suevi, crossed the Pyrenees and swept over the peninsula. About 412 the Visigoths invaded the country as agents of the weakened Roman government. After the fall of the Western Empire they maintained a show of authority with a monarchy organized in imitation of the Roman system. But they fell an easy prey to the Mohammedan invasion, and in 711–714 the Moors obtained mastery of nearly the whole of Spain. Under the Ommiad dynasty Spanish civilization far surpassed that of other European states. Systems of irrigation made a garden out of desert areas. Learning and literature were highly developed in great universities.

Castile and Aragon United. In 1031, however, the realm split into several small kingdoms, and the Christian kings of Castile, Aragon, and Navarre quickly took advantage of the divisions among the Moors to break their power. Ferdinand II, the last sovereign of Aragon, married Isabella, queen of Castile, in 1469. By the conquest of Granada in 1492 and that of Navarre in 1512, they united all the states of Spain under their joint rule.

It was under the auspices of the united kingdoms of Castile and Aragon, and especially under the protection of Queen Isabella, that Columbus started on his voyages of discovery, which laid the foundation for Spain's vast empire in the three Americas.

The kingdoms of Castile and Aragon had developed in the direction of constitutional government, with much power in the hands of the estates of the realm, or the Cortes. But Ferdinand and Isabella used the Cortes and other councils for their own purposes. At the great Cortes of Toledo in 1480 far-reaching reform and organization of the government were undertaken, the Inquisition was firmly established, and oppressive measures were adopted against the Jews. The free growth of industry, religion, and national life was checked by a vast system of taxation, supervision, and espionage.

Period of the Empire. At the death of Ferdinand in 1516, all Spain came under the single rule of his daughter Juana, called "the mad." But her son, the Habsburg Charles I, who in 1519 became emperor as Charles V, seized the throne, and Spain was dragged into the great scheme for aggrandizing the house of Austria. Charles V gave little attention to Spain, except as it served to supply him with treasure out of the newly acquired American territories. He even acknowledged the claim of the Cortes to the right of granting taxes, although he got what he wanted by bribery. Under his son, Philip II, the country was the victim of the worst vices of a bigoted absolutism. Its resources were exhausted in futile wars with every power of Europe. Spanish ships and soldiers won glory at the battle of Lepanto against the Turks, but the Protestant Netherlands were lost, the *Armada* was destroyed, and oppressive taxation served only to pile up disaster.

In 1680, the royal orders and laws relative to the Spanish colonies in America were compiled in the famous *Recopilación de las leyes de Indias*, "Laws of the Indies," a system of laws admirable so far as it went, and remarkably enlightened in its day. The system fundamentally failed, however, in looking upon the American possessions as a vast estate, closed to all the world and exploited only by Spain under a régime of the narrowest overlordship and the most exclusive of monopolies.

A Period of Decline. The reigns of Philip III and Philip IV witnessed a fearful acceleration in the national decline. That of Charles II was still more unfortunate, and his death was the occasion of the War of the Spanish Succession. Philip V was the

first of the Bourbon dynasty who occupied the throne of Spain. Under Charles III (1759–88) an industrial revival began. But, even though "enlightened," Charles III was a despot, and no sound national growth could come from his policy.

During the inglorious reign of Charles IV (1788–1808), a war broke out with Britain, which was productive of nothing but disaster to the Spaniards; and, by the pressure of the French, another arose in 1805 and was attended with similar ill success.

Charles's eldest son ascended the throne as Ferdinand VII. Forced by Napoleon to resign all claims to the Spanish crown, Ferdinand became a prisoner of the French, and Joseph, the brother of the French emperor, was declared king of Spain and the Indies. But before this time an armed resistance had been organized throughout the country. The various provinces elected juntas, or councils, and it was their business to administer local rule. The Supreme Council of Seville declared war against Napoleon and France in 1808. England made peace with Spain, recognized Ferdinand VII as king, and sent an army to aid the Spanish insurrection. After many bloody campaigns the French were driven from the country.

Efforts toward Liberal Reform. The Cortes in 1812, during the absence of Ferdinand, had adopted a liberal constitution, but on his return this was abolished and the old abuses restored. But the struggle against tyranny, already on the road to success in her New World colonies, had now really begun in Spain. A revolution in 1820 formulated a remarkably liberal constitution, but a French invasion suppressed the movement. The only reform which survived was the abolition of the Inquisition.

The next hundred years was a continual struggle between the advocates of a liberal, constitutional government and the adherents of the old absolutist and clerical party. Of the latter group, the extremists were the Carlists who, on the death of Ferdinand VII in 1833, supported Don Carlos in opposition to Isabella, for whom Queen Maria Christina was ruling as regent. Civil war broke out and the Carlists were defeated. The absolutists then aligned themselves with the queen regent and later with Queen Isabella.

The attempt to enforce an absolutist government provoked further liberal agitation, and in 1868 Isabella was compelled to flee from the kingdom. A liberal monarchical constitution was formulated, and in 1870 Amadeus, duke of Aosta, was induced to take the crown. But the chief supporter of the new government, Prim, had been assassinated, and after a troublous reign the king abdicated in 1873. A republic was declared with Castelar as president. But he displeased the radicals. After his resignation Alfonso XII, son of Isabella, became king.

A measure of parliamentary government was attained, but its effectiveness was rendered futile by a compromise whereby Liberals and Conservatives were to alternate in power as a matter of form rather than in response to public opinion.

Coming of the Republic. Alfonso XIII came to the throne in 1902, and during his reign Spain was neutral in World War I. A serious revolt of the Riff tribes in Spanish Morocco, however, revealed grave weaknesses in the army and the government. Misrule and industrial disturbances culminated in a military revolt, led by General Primo de Rivera. He made himself dictator, with the king's aid, and ruled from 1923 until 1930.

General Berenguer succeeded Rivera in 1930 and arranged for general elections. In March 1931, he was forced to resign; election plans were canceled; and, on April 13, a group headed by Niceto Zamora declared Spain a republic. King Alfonso fled from the country, and Zamora issued a call for the election of a constitutional convention. Elections were held on June 29. The republican form of government received popular ratification. A new constitution was drawn up and adopted. The church and state were separated; women were enfranchised.

The Republican regime, though victorious in the election of 1936, encountered opposition from the Church, the army, and the land-owning groups. A rebellion ensued, leading to civil war. In this struggle the Republicans received aid from France and Russia and were opposed by Germany and Italy. Britain and the U.S. maintained a nonbelligerent status. In 1939 the government forces were defeated, and a corporate state headed by General Francisco Franco was established. During World War II Spain remained neutral, but favored the Axis.

Consolidating its power through execution and imprisonment, the Franco regime established a repressive state-controlled society that lasted until his death. Although the political institutions had a progressive appearance, Franco himself held complete power. One of his last acts was to reestablish the monarchy and in November 1975, Juan Carlos I became king. The king declared an amnesty for most political prisoners, introduced bills to provide for considerable changes in the Francoist system, and appointed a new premier to guide Spain's transition to democracy. A legislative election—Spain's first free election in 41 years—in 1977 endorsed the new premier's government.

SUDAN

On January 1, 1956, the Sudan proclaimed its independence, and Great Britain and Egypt hauled down their flags in Khartoum, after jointly administering the Anglo-Egyptian Sudan for more than half a century by virtue of an agreement signed by the two governments in 1899. Early in 1953 an Anglo-Egyptian agreement guaranteed the Sudanese the right to determine whether they should join Egypt or become completely independent. A further agreement signed at Cairo in December 1955 provided a plebiscite to determine the country's future. But the Sudanese did not wait for this; they proclaimed a republic on January 1, 1956.

SWEDEN

When Sweden first appears in history, the country was inhabited by numerous politically separate tribes. The two principal groups were the Goths and the Swedes. Ingiald Hrada, the last ruler of the old royal family, sought to establish a single government. Erik Edmundsson acquired the sovereignty of the whole of Sweden about 829. Efforts to introduce Christianity were made, but it was not until the year 1000 that Olaf Skottkonung, the Lapp king, was baptized.

Growth of Swedish Power. The murder of Erik in 1160 by the Danish prince, Magnus Henriksen, who had made an unprovoked attack upon the Swedish king, was the beginning of a long series of troubles. In 1389 the throne was offered by the Swedish nobles to Margaret, queen of Denmark and Norway, who threw an army into Sweden, defeated the Swedish king, Albert of Mecklenburg, and, by the Union of Calmar, in 1397, brought Sweden under the same scepter with Denmark and Norway. In 1523 Sweden emancipated itself from the union with Denmark, which had become hateful to the Swedes, and rewarded its deliverer, the young Gustavus Vasa, by electing him king. Gustavus Vasa, on his death in 1560, left to his successor a hereditary and well-organized kingdom, a full exchequer, a standing army, and a well-appointed navy. Sigismund, grandson of Vasa, who had been elected king of Poland through the influence of his Polish mother, was compelled in 1599 to resign the throne to his uncle Charles, who was crowned as Charles IX in 1604. He renewed the policies of his great father, Gustavus Vasa, developing the power of the burghers at the expense of the aristocracy.

The deposition of Sigismund gave rise to the Swedo-Polish War of Succession; on the death of Charles IX in 1611, his son, the great Gustavus

Adolphus, found himself involved in hostilities with Russia, Poland, and Denmark. The young king soon concluded treaties of peace with his northern neighbors and placed internal affairs in order. Although he ranks as one of the greatest military commanders of his age, the extraordinary number of benefits which he conferred on the administrative system of Sweden entitles him to still greater renown as the benefactor of his native country.

After the death of Gustavus, his great minister, Oxenstierna, ably directed the government during the minority of Christina, his daughter. Sweden became the leading power of northern Europe. The reign of Christina, however, was disastrous. Charles X was occupied in wars against Poland and Denmark. The southern Swedish provinces, Danish up to that time (1658), were acquired by him. The long rule of his son, Charles XI (1660–97), was characterized by success abroad and the augmentation of the regal power. The military genius of Charles XII brought the climax of Swedish power, but his vast schemes of conquest left the country overburdened with debt. The male line of the Vasas expired with his death in 1718. His sister and her husband, Frederick of Hesse-Cassel, were called to the throne by election. During their reign the government was really in the hands of the nobles, who were divided into rival factions,—the Hats, or French party, and the Caps, or Russian party.

Union of Sweden and Norway. The weak Adolphus Frederick of Holstein-Gottorp, who was called to the throne on the death of Frederick in 1751, did little to retrieve the evil fortunes of the state; but his son, Gustavus III (1771–92), skillfully recovered the lost power of the crown. Gustavus IV was forcibly deposed in 1809 and obliged to renounce the crown in favor of his uncle, Charles XIII. The dominant party in Sweden, in order to win the favor of Napoleon, elected General Bernadotte to the rank of crown prince. Sweden's steady support of the allies against the French emperor, secured to her the promise of Norway, which, however, resulted in a purely personal union of the two kingdoms. Under the administration of Bernadotte, who in 1818 succeeded to the throne as Charles XIV John, the united kingdoms of Sweden and Norway made great advances in material prosperity and in political and intellectual development. Although the nation at large entertained very little personal regard for their alien sovereign, his son and successor, Oscar (1844–59), and his grandsons, Charles XV and Oscar II, so identified themselves with their subjects that the Bernadotte dynasty secured the loyal affections of the Swedish people.

Sweden, a Separate Kingdom. In the latter part of the 19th century serious difficulty arose between Norway and Sweden, owing to the desire of the former for a consular service of her own. In 1905 the two nations separated, and Oscar II continued monarch of Sweden until his death, December 8, 1907, when he was succeeded by his oldest son, Gustavus V. In 1909 manhood suffrage was introduced for elections to the lower house of the Parliament. Now there is in Sweden, as in Denmark and in Norway, universal and equal suffrage. During the World wars, Sweden maintained a neutral position.

From 1932 to 1976, Sweden was governed by the Social Democratic party, either alone or in coalition. The country established itself as the prime example of the mature, stable welfare state, and, by the 1970's, its people had the highest standard of living in the world. But rising taxes coupled with a decline in growth and trade produced widespread dissatisfaction and a victory for a conservative coalition in the 1976 elections.

SWITZERLAND

When the Romans began their conquest of Gaul (about 58 B. C.), they found in the Alpine territory two peoples, the Helvetians and the Rhætians. The country was conquered and connected with Italy by roads, and it became the center of a flourishing trade. About 400 A. D. the barbarian invasions brought the Burgundians and Alemanni into the country. They in turn were subdued by the Franks. The Burgundians accepted Christianity about the end of the 5th century, but the Alemanni retained their paganism until the 7th century.

After the downfall of the kingdom of Burgundy, the entire country fell to the control of Germany and so became a part of the Holy Roman Empire. Switzerland remained a stronghold of feudalism for several centuries. Under the rule of the dukes of Zähringen in the 12th century, the Swiss towns grew very prosperous, and in the 13th century, when the Habsburgs were the most powerful among the princes of the country, many of the towns and some of the cantons obtained imperial charters of liberties. The three forest cantons, Uri, Schwyz, and Unterwalden, formed a league in 1291 to resist the tyranny of the Habsburgs. Allied with Zurich, the confederation won the battle of Morgarten in 1315, thus securing their independence from Austria. The cantons of Glarus and Zug joined the confederation, which, with this added strength, defeated the Austrians at Sempach in 1386 and at Näfels in 1388. Early in the 15th century the cantons took the offensive, and a series of conflicts with Austria and Burgundy enlarged their territory and won them recognition from the states of Europe. In 1516 an alliance was concluded with France, which lasted until the French Revolution. During these two centuries Switzerland was rent by civil and religious dissension. Swiss independence was formally confirmed by the Peace of Westphalia in 1648.

The 18th century was a period of remarkable advance in Swiss agriculture and industry. Swiss scientists and scholars became famous. But the old struggle between the privileged aristocracy and the growing democratic element of the population continued. In 1798, under French direction, the Helvetic Republic was organized. This was changed to a confederation of cantons by Napoleon in 1803. A period of quiet and prosperity followed, and the Congress of Vienna in 1814-15 recognized the independence of the Swiss and guaranteed the perpetual neutrality of their state.

The 19th century was a period of steady advance in Swiss economic and political life. The confederacy and the cantons in 1848 finally became purely republican. Later revisions of the constitution have enlarged the powers of the central government, improved the educational system, and strengthened the machinery of the democracy. The Swiss use the initiative and referendum.

In the World wars Switzerland maintained her neutrality, kept her army on a war footing, and served as a refuge for wounded prisoners and exiles.

TURKEY

The name commonly applied to the Ottoman empire and the republic which succeeded it. In the Turkish language, *Turk* means "a rustic or clown" and is applied to the Turkomans of central Asia. The ruling people of the Ottoman empire called themselves Osmanli, from a chieftain, Osman or Othman, who established himself in western Asia Minor at the beginning of the 14th century. This Osman and his followers were the decendants of emigrants from central Asia, who, nearly a hundred years earlier, had sought safety among the Seljuk Turks from the advance of the Mongol conqueror, Genghis Khan. The Seljuks granted the newcomers land in Phrygia and converted them to the faith of Islam. But the Seljuk power declined, and the new Ottoman state rose in its place.

Ottoman Conquests. The first expansion of the Ottomans was westward. They mastered all the northwest coast of Asia Minor and crossed into Europe, where they seized Gallipoli and Adrianople. They closed steadily in on the Roman Empire of the East, until it had shrunk, in 1400, to the city of Constantinople and the small neighboring district of Thrace, Macedonia, and part of Greece. In 1389

the Turks had broken the Serbian power at the battle of Kossovo and had then made conquest of Bulgaria. They were now the first military power in Europe; their disciplined Janizaries, inspired by fanatic zeal, were irresistible. Macedonia, Hungary, and Greece were rapidly conquered, and in 1453 the city of Constantinople, deserted and weakened through the commercial jealousy of Western Christians, fell before the Mohammedan onslaught. The Turks moved their capital from Adrianople to Constantinople and proceeded to consolidate their European dominion. The Tatar khan of the Crimea became a vassal of the sultan. Albania, which had long held out, was at last subdued, and before the close of the 15th century the conquest of Otranto gave the Ottomans a foothold in Italy. Only Montenegro remained unconquered.

Selim I (1512–20) led the Ottoman arms in triumph through Syria to Persia, into Egypt, and down the western border of Arabia, where he assumed the power of the caliphs at Mecca. Under his successor, Solyman the Magnificent '1520–66', the height of the Ottoman power was reached. In his reign Belgrade was taken (1521), the island of Rhodes was captured (1522), the Hungarian power was broken at the battle of Mohács (1526), and in 1529 Vienna was besieged, a large part of Hungary being made a Turkish province. Algeria had already become tributary to the sultan, and Tripoli was taken in 1561. The Turks ruled the Mediterranean.

Decline of Turkish Power. But Western Christendom was now thoroughly alarmed. The pope, Venice, and Spain formed a Holy League, and, although Cyprus had fallen into the hands of the Turks, their sea power was broken by the defeat of Lepanto, off the coast of Greece. The decline of the Ottoman empire dates from this, the greatest naval battle the world had witnessed since the time of the Romans and Carthaginians. The rise of the Persian power checked the Ottoman advance in the East. The Polish monarch, John Sobieski, in 1683 turned back the Moslem force from Vienna, and in 1695 Peter the Great took up the Russian contest with Turkey, which was to last, with varying fortune, until World War I. In 1774 Russia secured the Crimea and other Tatar lands on the Black Sea; she was granted free navigation of Turkish waters and also a protectorate over Moldavia and Wallachia. The 19th century was a period of steady loss of territory. In 1854 only the intervention of England and France, who feared Russia, saved the Turks from being driven out of Europe. They were again saved from Russian destruction by the Congress of Berlin in 1878.

The Treaty of Paris in 1856, by which the Western Powers guaranteed the integrity of Turkey, was followed by the sultan's proclamation of civil rights to all races and creeds in the empire, and in 1876 a parliamentary constitution was proclaimed. But the real Turkish policy of persecution and massacre of non-Moslem peoples was carried out. The slaughter of Christians in Lebanon in 1860 and the Armenian atrocities in 1895-96 aroused angry but empty protests, significantly barren in results.

The Young Turks. At the opening of the 20th century, Turkey was rent by disorders and revolts in Europe and Arabia. In 1908 the Young Turk party, headed by men who had studied in Western universities, proclaimed the restoration of the constitution of 1876. In 1909 Sultan Abdul Hamid was deposed and Mohammed V was enthroned. But this widely-heralded "reform" movement proved to be only a transfer of tyranny from one group to another. The extermination of all peoples other than Ottomans within the empire soon appeared as the real policy of the Young Turks. Armenian atrocities before and during World War I appear as the characteristic conduct of the Turkish government toward non-Moslems. The Balkan wars of 1912-13 materially cut down Turkish territory in Europe. Italy in 1912 seized Tripoli, in Africa.

World War I. World War I revealed Turkey as the tool of Germany. Turkish troops successfully repelled Allied attacks on the Dardanelles, but the army, despite German leadership, was disastrously beaten in Palestine and Mesopotamia.

The Treaty of Sèvres between the Entente Allies and Turkey was signed on August 10, 1920. The terms left to the Turks in Europe only Constantinople and a small neighboring territory. Smyrna was placed under Greek control; Konia, given to Italy; and Cilicia, assigned to France. Armenia and Kurdistan were declared independent.

The Republic. This treaty was never ratified by Turkey. A strong nationalist movement began, led by Mustapha Kemal Pasha. A government was set up at Ankara (Angora), which demanded modification of the treaty. When Constantine was recalled to the Greek throne in December 1920 the Allies agreed to a settlement more favorable to Turkey. Greece dissented but, in August 1922, suffered defeat by the Turks. Kemal demanded restoration of Smyrna, Istanbul, and Thrace east of the Maritza river, which he obtained by the treaty of Mudania, Oct. 11, 1922. With their prestige enhanced by victory, the Nationalist leaders abolished the office of sultan. A new constitution was adopted. Turkey became a republic with Kemal as the first president. Ankara was made the capital, and the name of Constantinople was changed to Istanbul.

Kemal proceeded to modernize Turkey. Polygamy was forbidden. The law of the Koran was replaced by a civil code. The wearing of the fez, with its religious associations, was prohibited. Education was secularized. Arabic letters were replaced by the Latin alphabet. Railroad building and irrigation projects were undertaken and state-sponsored industries were initiated. Kemal died in 1938.

Turkey joined NATO in 1953 but the country has generally taken a neutral position in most conflicts, including the Arab-Israeli wars. Its military forces did invade Cyprus in 1974 when the Greek junta attempted to overthrow the island's government. As a result, relations became strained with the U. S.

UKRAINE

The soviet republic of Ukraine (*ū'krān*) includes a large territory which, before World War I, was divided between Russia and Austria. The history of this area as a distinct and, at times independent, state dates back to the 9th century, when the city of Kiev was made the center of a government. After the Tatar invasions of the 13th century, the country was for 200 years a part of the Lithuanian state. In the 16th century it was incorporated with Poland, but in the middle of the 17th century the Ukrainians revolted from the Polish power, and, by the Treaty of Pereyaslavl, the greater part of Ukraine was joined to the territory of the Muscovite czars. The western portion of Ukraine passed later to Austria. After the close of World War I, both Russian and Austrian Ukraine declared their independence. A union of the two was effected in 1919, and in 1920 a soviet government was established. It joined the Russian Soviet Union in 1923. In 1945 the union of the Ukraine was completed by the Czechoslovak cession of Carpatho-Ruthenia to Russia.

VATICAN CITY

The state of Vatican City, occupying almost 109 acres within the city of Rome, was created in 1929 when Pius XI and Mussolini, dictator of Italy, signed the Lateran Pacts. The Italian constitution of 1947, reaffirmed the Vatican independence. For almost 1000 years, the papacy, or Holy See, had held extensive possessions known as the Papal States. By 1870, these possessions, including Rome, had been annexed to the kingdom of Italy. A unilateral settlement, granting the pope the use of the Vatican and an annuity, was declined until 1929, when Italy recognized the Vatican's sovereignty and the papacy accepted compensation for its lost possessions.

The southern European state of Yugoslavia (*yōō'gō-slāv'ĭ-ə*) was constituted in December 1918 by the union of Serbia with certain Croatian, Slovenian, and other Slav provinces of the former Austro-Hungarian empire. In March 1921, Montenegro joined the new state. A constitution, which provided for a limited monarchy, was put into effect on June 28, 1921. It was suspended in 1929 by King Alexander, who made himself dictator. In 1931, he promulgated a new constitution, but it left him still with supreme power in matters of state. King Alexander was murdered at Marseilles in 1934; his minor son, Peter, became king.

In World War II, Yugoslavia at first leaned toward Germany. Its government was overthown in March 1941, and the Nazis promptly occupied the country. An underground army under Jozip Tito skillfully pinned down large German forces during the war. It cleared the country of the invaders in 1945 and declared Yugoslavia a people's republic with Tito as prime minister. Under a constitution of 1953, Tito served as president and, by amendment in 1963, was made president for life. Under his leadership, Yugoslavia's soviet-type government followed policies at variance with Russia's. Stalin tried to replace him but failed partly because of Western economic assistance. With a modified form of communism, he maintained a neutral position between East and West.

Serbia (*sĕr'bĭ-ə*). From the 7th to the 11th century the Serbs enjoyed virtual self-government in the Roman province of Mœsia in the northwestern part of the Balkan peninsula. When the Byzantine government attempted to place some restrictions on them, they revolted under their grand shupon, or patriarch, Michael, who took the title of king and made a successful fight for independence. By the middle of the 14th century the Serbian empire included Bosnia, Albania, Macedonia, Thessaly, and part of Bulgaria, and reached to Attica and the Peloponnesus. But the Serbian power fell before the Turks, who completed their conquest in 1459. The independence of Serbia was recognized by the Congress of Berlin (1878), and in 1882 it became a kingdom.

In 1893 Alexander I came to the throne. He began at once to assume the role of autocrat. This policy exasperated the liberal party. On June 11 the king, the queen, and about fifty others were assassinated. As king the government chose Peter, grandson of Kara George, a patriot who had led an unsuccessful revolt against the Turks.

Serbian national ambitions now brought the country into frequently strained relations with Austria and Turkey. Through the Balkan wars (1912-13) Serbia doubled her territory. But Serbian hatred of Austria was increased by the refusal of the latter to allow Serbia a port on the Adriatic. On June 28, 1914, Archduke Ferdinand, heir to the Austrian throne, was assassinated in Bosnia by Serb nationalist conspirators. This event touched off World War I.

Montenegro (*mŏn'tĕ-nē'grō*). Formerly a principality on the eastern shore of the Adriatic Sea, and united to the Serbian kingdom from 1159 to 1356. After the defeat of the Serbs by the Turks at Kossovo in 1389, the Montenegrins, in their mountain fastnesses, began in turn their long struggle with the same enemies. In 1484 Ivan the Black withdrew with his people to the mountain village of Cetinje, founded a monastery, and created a bishopric. In 1696 the offices of prince and bishop, or *vladika*, were combined under the title of vladika. The last and greatest ruler to hold this title was Peter II (1830–51). Danilo I took the title of prince. In 1878 the independence of Montenegro was recognized by the Treaty of Berlin. On Nov. 29, 1918 the National Skupshtina deposed King Nicholas, who had reigned since Aug. 28, 1860, and a decision was made to unite Montenegro with Serbia.

In the course of the centuries, the various races and tribes of the world's population have shifted from region to region, and, as a result, many cities, once busy and prosperous, have become as so many desert places of the earth.

Most of the cities described below are today no longer existent. In the case of others, their sites are occupied by villages or small towns of little importance.

Antioch (*ăn'tĭ-ŏk*). This ancient capital of the Greek kings of Syria, on the Orontes, 21 miles from the sea, was built by Seleucus Nicator about 300 B. C. and named for his father. As a point of trade exchange between the caravans from the East and the Mediterranean shipping from the West, it became wealthy, and both Greeks and Romans so adorned it with public buildings that it was called the "Queen of the East." Here the disciples of Jesus were first called Christians. The modern Antioch, or Antakieh, is a small city with but little manufacturing and trade.

Baalbec (*bāl'bĕk*), "City of Baal," the sun god, called Heliopolis by the Greeks. A ruined city on the slope of the Antilibanus mountains, about forty miles northwest of Damascus. It was a very ancient center of sun worship, and in Greek and Roman times it became the site of a great temple of the sun, built by Romans about 150 A. D Pillaged by Arabs, Tatars, and Turks, and ruined by earth quakes, the city survives merely as a small village.

Babylon (*băb'ĭ-lŏn*). The ancient capital of Babylonia. The name probably means "gate of the gods." Already in existence in the time of Sargon, about 2800 B. C., the city grew in importance until Hammurabi made it his capital, about 2100 B. C. It was several times destroyed and rebuilt. Nebuchadnezzar enlarged it and brought it to its greatest splendor. Excavations in several mounds and villages, mostly on the east bank of the Euphrates, have recently revealed this city of Nebuchadnezzar (605–562), as well as scanty remains of earlier periods.

Byblos (Compare the word Bible). Now a village of 1000 called Jebeil, its former importance is shown by rich archaeological discoveries. Phoenician writing from the tomb of King Ahiram (1100 B.C.) is among the earliest known alphabetical inscriptions. Pottery fragments link Byblos with Babylonian and Persian civilizations.

Carthage (*kär'thĭj*). An ancient Phoenician city in northern Africa, near the site of the modern Tunis. Probably it was originally founded in the 9th century B. C. as a trading post for Tyre and Utica. It grew in commercial power, extending its authority westward to the Atlantic and establishing trade in Sardinia, Gaul, Spain, and Britain. Conflict with Rome arose in the 3d century B. C. and, after the three Punic wars, it was utterly destroyed in 146 B. C. It was rebuilt by Augustus, and was for several centuries a great Roman city. Recent excavations by French archeologists have revealed important remains dating from the earliest period of the city, which throw much light upon its culture.

Corinth. An ancient city of Greece, situated between the gulfs of Corinth and Ægina. It became proverbial for its luxuries and pleasures. Its fountains, statues, theaters, and other buildings were of a design which created the order of architecture known by its name. The Romans destroyed the city in 146 B. C., but Julius Cæsar rebuilt it in 46 B. C. St. Paul addressed his *Epistles to the Corinthians* to a Christian community which formed in Corinth under his ministrations. New Corinth was built on a site three miles distant, after an earthquake had destroyed the old city in 1858.

Ephesus (*ĕf'ĕ-sŭs*). The origin of this Ionic city of Asia Minor is lost in mythology. It was situated in Lydia, near the mouth of the river Cayster, at the western end of a great Asiatic trade route. Under the Romans, it was the capital of the Province of Asia and a prosperous trade center. Its greatest fame arose from its temple of Diana. St. Paul spent three years in the city, and the church of Ephesus was important in early Christian history. Several times destroyed and rebuilt, it sank to small importance in the middle ages. Recent excavations have uncovered the Roman city.

Gaza (*gā'zə*). An ancient Syrian town, situated near the seacoast, about fifty miles southwest of Jerusalem. The ancient city, which Herodotus regarded as equal in importance to Sardis, was a border fortress and a commercial center because of its position at the junction of trade routes between Egypt, Arabia, and Syria. The earliest notice of the place is in the Tel-el-Amarna letters, one of which was written by the local governor to his superiors in Egypt. The Israelite king, Hezekiah, held Gaza for a short time, but surrendered it to Assyria. It withstood a siege of five months by Alexander the Great. In 96 B. C. it was

totally destroyed by Alexander Jannæus. Aulus Gabinius rebuilt the city on a new site in 57 B. C., the old location being spoken of as Desert Gaza. Gaza was famous for the long and bitter struggle to substitute Christianity for the local worship of *Marna*, "Lord." In 402, the new faith triumphed. The modern town is called Ghuzzeh.

Herculaneum (*hĕr'kû-lā'nê-ŭm*). A Roman city, situated about five miles southeast of Naples. In the eruption of Vesuvius, 79 A. D., it was buried under volcanic mud and lava. The site was forgotten, until in 1738 the digging of a well in the village of Portici uncovered its ancient theater.

Jericho. The oldest known city. It occupied what is now Ariba in Jordan, six miles northwest of the Dead Sea. Extant walls were built there about 6800 B.C., more than 5500 years before the city was captured from the Canaanites by the Israelites under Joshua.

Memphis (*mĕm'fĭs*). A city of ancient Egypt, said to have been built by Menes, first king of Egypt. It was for a time the capital of Egypt, and, in the 6th century B. C., the chief commercial city. In the 7th century A. D., it was destroyed by the Arabs. The site of its ruins is the village of Metrahineh, twelve miles south of Cairo.

Mycenæ (*mi-sē'nē*). An ancient Greek city, on a steep hill six miles northeast of Argos. It was the home of Agamemnon before the Trojan war. Excavations begun by Schliemann in 1876 have revealed, through the relics recovered, the life of the period of Greek civilization called Mycenean, dating from before 1600 B.C.

Nineveh (*nĭn'ê-vē*). One of the ancient capitals of Assyria, first made important by Sennacherib, 705–681 B. C. It was destroyed about 606 B. C. by Babylonians and Medes. The site of the city is the present village of Kuoyinjik, opposite Mosul. Excavations by Layard and later explorers have uncovered splendid palaces, temples, and libraries in the mounds of this district.

Palmyra (*păl-mī'rà*), "City of Palms." A ruined city situated in an oasis of the Syrian desert, about 140 miles northeast of Damascus. It was enlarged by Solomon in the 10th century B. C. as an outpost of the kingdom of Israel. It is most famous as the residence of Zenobia, "Queen of the East," in whose reign the city was besieged and destroyed by Aurelian, 273 A. D.

Pergamum (*pēr'gà-mŭm*). A city of Asia Minor, on the north bank of the Caicus, fifteen miles from the sea, the site of the modern Bergama. From the beginning of the 3d century B. C., it was famous for its library, second only to that of Alexandria, for its architecture, and for its manufacture of tapestries and pottery. Parchment (*Pergamenta Charta*) derives its name from the city. The church at Pergamum was one of the seven addressed in the Book of Revelation.

Persepolis (*pĕr-sĕp'ô-lĭs*), "City of the Persians." The capital of ancient Persia, most famous under Darius and Xerxes. The citadel was destroyed by Alexander about 330 B. C., but the rest of the city was important for two centuries more. The ruins of Persepolis, in the mountain-rimmed plain near the junction of the Kur and Polvar rivers, are among the most extensive and important remains of the ancient world.

Pompeii (*pŏm-pā'yē*). The ancient city, about twelve miles southeast of Naples, destroyed in the eruption of Vesuvius, 79 A. D. At this time it was covered by ashes and pumice in such a way that the entire city was preserved almost intact. For two centuries it had been a favorite seacoast resort for the Romans.

Sardis (*sär'dĭs*). The ancient capital of Lydia, in Asia Minor. Through its market place flowed the river Pactolus. Once the center of a rich trade, and the residence of Crœsus, nothing remains on its site today but a village and some mounds. Recent excavations conducted by Americans have uncovered a great temple of Artemis, of the 4th century A. D.

Sidon (*sī'dŏn*). "Fishingtown." One of the chief commercial cities of ancient Phœnicia, situated on the coast midway between Tyre and Beirut. It is now called Saida. Many allusions to the city are found in Homer and in the Old Testament. It was famous for its manufacture of glass, linen, and purple dye. Many notable remains of the city's splendor have been found, among them a collection of sarcophagi from the best period of Greek art.

Susa (*sōō'sà*). A city, originally under Babylonian rule, which came under Persian authority in the time of Cyrus and was made a splendid capital. From Susa to Sardis, in Asia Minor, ran a royal road, 1500 miles in length. In the middle ages the city was still noted for its manufacture of sugar. It is mentioned in the Old Testament as Susa or Shushan, in connection with Esther and Daniel. From the ruins of the place, which lie in southern Iran about fifty miles west of Shuster, many inscriptions and remains of ancient art and building have been recovered.

Tarsus (*tär'sŭs*). An ancient city of Asia Minor, in Roman times the capital of the province of Cilicia. Some traditions ascribed its foundation to the Assyrian king, Sardanapalus. It was, however, very early colonized by Greeks, and Greek writers speak of it as an important and wealthy city. The situation of Tarsus, on the river Cydnus, placed it in the path of armies of conquest from the time of Cyrus to the ages of Alexander and the Cæsars. Under the Romans, the inhabitants of Tarsus enjoyed Roman citizenship and the city rivaled Alexandria as a center of culture. St. Paul proudly claimed it as his native city. After its capture by the Saracens in 640 A. D., it lost its former importance. Modern Tarsus is but a small town in the Turkish province of Adana.

Thebes (*thēbz*). Egypt. A city, about 350 miles southeast of the modern city of Cairo, which was the capital of ancient Egypt between the 16th and 12th and, again, in the 7th century B. C. It fell into insignificance later, and an earthquake, in 27 B. C., completed its ruin. Its remains, recently discovered near the villages of Karnak and Luxor, bear witness to its former magnificence and splendor, and include colossal statues, palaces and tombs of kings, and temples sacred to Ammon and to other gods. The most notable recent discovery near Thebes was the uncovering of the tomb of Tutankhamen, in the valley of the Tombs of the Kings. See *Egypt*.

Thebes. Greece. A city of Bœotia, probably one of the earliest centers of population in Greece. It owed its chief importance throughout its history to its strength as a fortress. Tradition ascribed the building of the first citadel, the Cadmeia, to Cadmus. In the 6th century B. C. the Thebans adopted a hostile attitude toward the Athenians. The outbreak of the Persian wars found them on the side of Sparta, but their ruling aristocracy soon went over to the Persians. In the Peloponnesian war Thebes fought on the side of Sparta, but in the early part of the 4th century B. C. the two cities were almost continuously at war with each other. At length, under the leadership of Epaminondas and Pelopidas, Thebes attained for a short period (371–362) to the position of the chief power in Greece, but speedily lost it after the death of Epaminondas. The resistance of the Thebans to the Macedonian and the Roman power brought severe reprisals upon the city. It sank into an insignificance relieved only by a transitory prosperity in the 11th and 12th centuries A. D., and was finally destroyed by the Catalans in 1311.

Troy. A city on the coast of Asia Minor, about three and a half miles from the Dardanelles. Troy was the most famous city of Greek legend, having been celebrated in the first instance by Homer in the *Iliad* as the prize of the Trojan war. The site is now known as Hissarlik. In 1870, Schliemann began a series of excavations there, which have revealed the remains of nine successive settlements made upon the spot. The sixth one is believed to be the city described by Homer, on account of the similarity of its remains to those found at Mycenæ. The other settlements range from a village of the Stone age to a Greco-Roman town which rose into prominence after 334 B. C. This last town passed under Roman protection in 189 B. C. and was honored as the city from which came Æneas, a reputed ancestor of the Romans. In 1306, the Turks plundered the city, which, since that time, has lain in ruins.

Tyre. The famous city of ancient Phœnicia. It attained its greatest glory under Hiram, in the 10th century B. C. It was celebrated by ancient poets for the beauty of its scenery, and its harbors were among the wonders of the world. The basis of its commerce, which reached all countries, was its dyed woolens. This trade it continued, though in diminished volume, until the 16th century A. D., when the discovery of the sea route to the East diverted trade from its old courses. A small town, called Sûr, now occupies the ruins of the ancient city.

Ur (*ûr*). The Bible story of Abraham mentions Ur of the Chaldees as the Mesopotamian home of the patriarch. The site of this ancient city bears the modern name of Mughair, meaning pitch-built and given in allusion to the large quantities of pitch which were used in the construction of its earliest buildings. The city, which stood about 140 miles southeast of Babylon, was the chief center of the worship of the moon god Sin. The ruins of the famous zikkurat, or stage tower, still rise impressively above the surrounding plain.

Recent excavations have revealed successive reconstructions of walls and temples, made in various periods from the 30th to the 4th century B. C. The earliest remains, however, which are of unbaked clay bricks, indicate Sumerian construction antedating by many centuries the year 3000 B. C. Conspicuous among the reconstructions is that carried out by Nebuchadnezzar, in which the early form of the temple of Sin was, for the first time, radically altered. The historical record of the city is now complete from about 2300 B. C. to about 400 B. C., when, under Persian rule, Zoroastrianism displaced the city's ancient religious cult and effected the destruction of its temples.

PEOPLES OF THE WORLD

The known origins of man begin some two million years ago. Progress toward the man of today (*Homo sapiens*) was slow, but ever increasing in tempo. Many strains and varieties lived in the remote past, but elements of many of these have blended and united to yield modern man—one genus, one species. Modern man has divided further from his fellows in three ways. The first of these is linguistic; there are approximately 2500 languages spoken in the world today and thousands of others have become extinct. The second type of human difference is cultural, lying in the different ways in which each human group solves those problems general to all mankind or special to each because of its environment or recent history. It is harder to divide similar cultures than similar languages, but the number of distinct cultures is close to that for languages.

The third difference between human populations is a physical, or, more accurately, a genetic difference. This is commonly called *race*. There are far fewer races than there are languages or cultures; the largest recent classification lists 34 races, the smallest six. None of these includes all human populations, some being too small and others too heterogeneous.

These three elements of differentiation—race, language, and culture—are not definitely linked to each other; they vary with surprising independence. Peoples close in language may be different in culture (as the French and Rumanian); those close in culture may be different in language (as the Finns and the Swedes); and most racial groups cross both linguistic and cultural barriers. Racial differences between peoples do not imply in any sense cultural or psychological differences. Rather, they are based on known genetic differences in fairly minor characteristics, such as the relative frequency of each of the blood-group types. The articles which follow are divided into prehistoric and historic peoples. The historic peoples, although going back to prehistoric times, are those existing in historic times and usually to the present day.

PREHISTORIC PEOPLES

For over 150 years man has been unearthing the physical and cultural remains of his ancestors. Evidence ranges from scattered surface finds to caves and garbage heaps (middens) through the more highly developed settlements and in some cases into huge ceremonial centers or cities. Altogether, for most areas of the world prehistorians have at least a good general knowledge of man's prior cultures and the general series of patterns of man's development. Detailed knowledge exists as to several of the richer areas of only several thousands of years' antiquity. Such knowledge is based on many disciplines but particularly on the application of atomic research. See *Prehistory and Atomic Dating*.

Almost all prehistoric men belonged to one of three large taxonomic groups, *Australopithecus*, *Homo erectus*, and *Homo sapiens*, though each of these may be further subdivided. Physical anthropologists have shown that the major diagnostic trait of man (all members of the family *Hominidae*) is his adaptation to permanently erect posture. This freed the hands from locomotion so that tool using could become much more important, and this in turn fostered the evolution of the larger, more complex brain. This latter development was very slow and was completed only in the last 15 minutes of a 12-hour day representing man's total time on earth.

Until the end of the Pleistocene epoch, some ten to fifteen thousand years ago, man remained a hunter using flaked or chipped stone tools and living in small nomadic bands. Prior to this time, man had changed physically from something very close to an erect ape to man as we know him now. Then, about 10,000 years ago, in advantageous areas began the inventions that led to the atomic age.

The first step was the domestication of plants and, in some areas, animals. This led to a settled life in which a major portion of the people could be freed from having to raise their own food. Population grew rapidly with economic specialization, village life, then civilization, and finally cities and nations. Civilization was characterized by huge public buildings, by centralization of religion and government, and by development of the arts and sciences.

The following articles describe in alphabetical order some of the better known prehistoric populations of the Old World. In the New World, there was no known human habitation prior to 25,000 years ago.

Australopithecus. Sometimes erroneously called "man-apes," this is a large group of the earliest men. They are variously cited as a separate genus or sub-genus of the human family, the *Hominidae*, though one member may be placed within the genus *Homo*. They are most widely known in late form from South Africa, but the earliest two strains, *Homo habilis* (6 specimens) and *Zinjanthropus boisei* (3 specimens) come from Dr. Louis Leakey's work in the Oldowan Gorge of Tanzania. Tools are associated with each of these. In 1967, Harvard University's Professor Bryan Patterson reported the discovery in Kenya of the lower portion of a human humerus, the large bone of the upper arm. The specimen dates from 2,500,000 years ago, the very beginning of the Pleistocene epoch. As such, this is the earliest known specimen of man. Known only as Kanapoi Hominid One (KH1), from the dry wash where it was found, it can be classed as an early form of Australopithecine.

Most members of the Australopithecine group fall into one of two categories. One, often labeled *Paranthropus*, tends to be large, robust, and have huge molars, prominent brow-ridges, and a sagital crest. Zinjanthropus belongs to this group. The second group tends to be smaller, have normal teeth, small brow-ridges, and to be generally more modern. *Homo habilis* belongs in this group, as does the later *Australopithecus africanus*. It is impossible to assign the Kanapoi specimen to one or the other definitely. Compared to modern man, both were small and had small cranial capacities, 500 to 800 cc. as opposed to 1300 to 1600 cc. Yet all were upright in posture, and one strain, possibly *Homo habilis*, may well have given rise to later forms of man. The probable time span of these early humans was from two million to almost 500,000 years ago.

Cave Men, or **Cave Dwellers.** This is a misnomer. Early man lived in caves all over the world. There is no one such group.

Cro-Magnon Man. This is the generic name for the *Homo sapiens* population of Europe, whose first appearance comes around 25,000 years ago and who bear Upper Paleolithic tool traditions. The name is taken from a French cave, where remains of five persons were discovered in 1858. Dr. Theodosius Dobzhansky classified Cro-Magnon and all of his cousins as *Homo sapiens cosmopolitans*, the last prehistoric race of *Homo sapiens* and a major ingredient in all modern peoples. Cro-Magnon man lived in Europe and North Africa, used blade tools, inhabited caves, but had many different cultures, though all were hunters. They were modern men in all respects and of modern size and cranial capacity.

Heidelberg Man. This name is given to a group on the basis of a single specimen of a lower jaw discovered in 1907 near the city of Heidelberg, Germany. The jaw is clearly human and fits well into the classification of *Homo erectus*, the second stage in the major lines of mankind. The most probable date is late second glacial period, possibly about 360,000 years ago. This is the only known specimen of *Homo erectus* from Europe.

Homo Erectus. This is the taxonomic name given to a widely spread but relatively homogeneous human population. It represents the "second stage" in the development of man, following on *Australopithecus*. All members of this group were larger than their ancestors, their brow-ridges were large, their limb-bones bent, and their cranial capacity ranged from around 900 cc. to 1200 cc. All were tool users, some may have mastered fire. Their geographic distribution covers the whole of the Old World—Java man in southeast Asia, Peking man in eastern Asia, Heidelberg man in Europe, Atlanthropus in northern Africa, and Chellean III man in eastern Africa. Their distribution in time is open to some doubt. Some authorities place the last of the *Homo habilis* specimens in *Homo erectus*, yielding a date of before 1 million years ago. Others place Java Man IV, 800,000

years ago, as the first of this genus. Most experts see the end of this genus *per se*, at about the time of Peking man, 450,000 years ago; a few differ, and see the genus as continuing until almost 50,000 years ago in Rhodesia man and Solo man.

Homo Habilis. A very early yet somewhat modern strain of man. (See *Australopithecus*).

Homo Sapiens. This taxonomic name is given to all modern men, but it can be traced back 250,000 years or a little more. This is the third stage of man's development, after *Australopithecus* and *Homo erectus*. *Homo sapiens* is taller, slimmer-boned, has less brow-ridge and more forehead, and has a larger cranial capacity than any of his forebears. Generally speaking, the cranial capacity of *Homo sapiens* is over 1250 cc. Included in this group are the Pre-Neanderthaloids, the Neanderthals, Cro-Magnon, and all modern derivative strains.

Java Man. He is sometimes called *Pithecanthropus erectus*, more recently *Homo erectus javanensis*. He was a prototype of the *Homo erectus* form of man, having a cranial capacity of 900 + cc. to 1100 cc., taller and heavier than the australopithecines, with heavy brow ridges, bent limb bones, and a large ridge on the back of the skull. Known specimens spanned the time from the first to the end of the second glacial periods, some 700,000 to 500,000 years ago. There is some evidence of continuation of descent from Java man to the contemporary inhabitants of Australia and perhaps New Guinea.

Kanapoi Hominid. The name given in 1967 to the earliest discovered human fossil specimen. See *Australopithecus*.

Neanderthal Man. This group covers many local strains of men who lived from just before to nearly the end of the fourth glacial period. Centered in western Europe, they ranged through North Africa and far into Asia. They were characterized by the Mousterian tool tradition, a combination of the two major tool-making techniques (flaking and core-biface) which preceded them. Neanderthal man gives our first secure evidence of formal religion, seen in their regular burial practices. These people appear to many to be "throwbacks," in that they had large, bent limb bones, massive eye ridges, and generally "primitive" characteristics. Some experts hold these people to be a local adaptation to the onset of the last (4th) glacial period; others suggest an amalgamation of *Homo erectus* and *Homo sapiens* types. Whichever is correct, Neanderthal man and the Mousterian culture which characterizes him disappeared during the Gottweig interstadial, a recession of the Würm (4th) glaciation. Only in Israel is there any possible evidence of intermixture between Neanderthal and Cro-Magnon, and even this is based on a very small number of specimens.

Peking Man. This name refers to the remains of over 40 individuals found in the lower cave at Choukoutien near Peking. Peking man is now usually referred to as *Homo erectus pekinensis*, showing the clear affiliation to Java man. He is clearly a first cousin to Java man, though he postdates his Java cousin, having lived around 450,000 years ago. At the Choukoutien cave there was a scorched hearth, which gives Peking man first honors to date as a user of fire.

Pre-Neanderthaloids. This is the name given most often to the earliest known members of *Homo sapiens*. As a group they are less massive and primitive in appearance than the "classic" Neanderthals, who came after them. Dr. T. Dobzhansky classes this group as *Homo sapiens presapiens*, the first known race of modern man. Two specimens, *Steinheim* from Germany and *Swanscombe* from England, lived a quarter of a million years ago during the second interglacial period. The other specimens were also found in Europe, but lived during the third interglacial period between 100,000 and 70,000 years ago. Some of the better known finds in this group are *Ehringsdorf* from Germany, *Fontechevade* from France, *Saccopastore* from Italy, and *Krapina* from Yugoslavia.

Rhodesia Man. An almost complete skull and other bones were found at Broken Hill, Rhodesia, in 1921 as part of a mining operation. The bones are peculiarly massive, the skull having the largest brow ridges of any fossil specimen. Rhodesia man dates from the middle of the fourth glacial period, perhaps 25,000 years ago. This specimen is most likely an African representative of Neanderthal man.

Solo Man. Eleven skulls, with some legbones, discovered in Java between 1931 and 1933 are collectively known as Solo man. All the faces had been cut off, and all but two of the brain cases were broken open at the base. Almost certainly, these eleven persons served as dinner for someone else. Morphologically, they lie intermediate in grade between *Homo erectus* and *Homo sapiens*. They are almost certainly descendents of Java man and ancestors of the contemporary, aboriginal population of Australia. They probably date from approximately 50,000 years ago.

Zinjanthropus. The name means "nutcracker man" and is applied to a very early hominid, almost certainly not ancestral to modern man. See *Australopithecus*.

HISTORIC PEOPLES

Afghans. The primarily pastoral and recently sedentary peoples of the Afghan Mountains and the eastern Iranian Plateau. Probably related to the *Aryan* invaders of India, the Afghans inhabit the gateway from the West to the East, the Khyber Pass entry into Pakistan. Indo-European in speech and Islamic in religion, the Afghan tribes are noted for their bravery and prowess in the arts of war. They are of tall stature, medium complexion, and aquiline feature, and are especially remarked for their full, flowing beards.

Albanians. The name is most properly applied to the speakers of Albanian, in and of itself a separate family within the Indo-European stock. Dwellers of the southwest coast of the Balkan peninsula, the Albanians exhibit a tenacity for their own customs in spite of the many centuries of exposure to Greek, Italian, and Turkish influence. Even in the late 1960's, Albania's government chose to align itself with the Chinese Communist regime, although surrounded by Russian satellites, Titoist Yugoslavia, and free Greece. The state of Albania contains over 1.5 million people, but perhaps as many as one half million more Albanians live in eastern Greece, southern Italy, and Sicily. Though nominally allied in "The Peoples Republic of Albania," these peoples are largely governed today, as they have been for centuries, by local chieftains ruling over their kinsmen. They are predominantly Islamic in religion, though 20 per cent are Greek Orthodox and 10 per cent are Roman Catholic.

Algerians. These are citizens of Algeria, but the term is more widely applied to the culturally and racially heterogeneous population of former French Algeria. Specifically, they are French colonists in Algeria, as opposed to *Berbers* and *Arabs*. These three groups aim at establishing a national identity, Islamic by religion, north African by alliance, and French by influence.

AMERICAN INDIANS

Thinking he had circled the globe, Christopher Columbus gave the name Indians to the inhabitants of the New World. It is generally believed that the first of their ancestors were travelers who, about 25,000 years ago, went from Asia to North America across Bering Strait, then a land bridge between the continents. Groups came, settled, and moved on, eventually populating the whole continent. As far south as the tip of Chile, remains have been radiocarbon dated at more than 8000 years ago. Not much is known about these early people save that they were hunters. At Folsom, New Mexico, one of the stone points found was embedded in the bones of a bison. Radiocarbon dating established that these hunters lived 10,000 years ago.

North American Indians. Many of the inhabitants of North America lived by hunting and gathering for thousands of years, improving their technology and the beauty of their crafts. On the West Coast, food was boiled by dropping very hot stones into water-tight baskets in which acorn meal was cooked. In the Ozarks and elsewhere, Indians learned to cultivate the local plants, among them beans, squash, and corn, which spread north from Mexico between three and five thousand years before the time of Christ. Pottery-making was also learned, perhaps by accident as someone left a clay-covered basket too long in the fire.

Other natives of America are known for their building; great apartment houses or pueblos still stand in New Mexico and at Mesa Verde in Colorado, built in the 12th and 13th centuries A.D. Great earthworks or mounds for temples or houses may be seen in the Ohio and Mississippi valleys, built by Hopewell people and their descendants in the 14th through the 16th centuries A.D. Had Columbus traversed the continent, he would have met with great variety.

Linguists have perhaps best been able to group the various American Indian tribes. In 1891 J. W. Powell separated more than 50 different families, later arranged by Edward Sapir into six major groups of language stocks: Eskimo-Aleut, Algonkin-Wakashan, Hokan-Siouan, Penutian, Nadene, and Aztec-Tanoan. Many groups are now widely separated, while others are geographic and cultural neighbors, sharing some words and many customs. Work by Morris Swadesh has revealed additional linguistic relationships which may link peoples to specific waves of migrations across Bering Strait those many years ago.

CULTURAL AREAS AND TRIBAL GROUPS

Indians of the Arctic Region. Far to the north live the Eskimos and the Aleuts, the latter inhabiting the westernmost islands of Alaska. Known for their ability to endure the Arctic climate, these people used skin boats and dog sleds to hunt seal and other sea mammals; caribou were also hunted, particularly in Alaska. Among the products of Eskimo technology which have found their way into present-day use are the fur parka, toggle fasteners, kayak, snow goggles, and soapstone carving, all well executed.

Woodland Peoples. In the Eastern United States and Canada lived woodland peoples, including the Algonkin and most of the New England and Atlantic Coastal tribes, such as the Powhatan, of whom Pocahontas is well known. Also included were the Ojibway, Menomini, Winnebago, Potawatomi, and Shawnee, all speakers of the Algonkin-Wakashan stock. Others were Hokan-Siouan speakers, such as the Six Nations (Seneca, Cayuga, Onondaga, Oneida, Mowhawk, and later Tuscarora) and the Iroquois, plus the Choctaw, Chickasaw, Creek, Cherokee, and Seminole among others. Among these peoples the languages were not always mutually intelligible; hand signs or pictographs often served as a means of communication between groups. In the northern part of the woodland area, hunting and fishing formed the major way of life, giving way to the cultivation of maize, squashes, melons, beans, and tobacco towards the south.

Women did most of the cultivation, while men hunted and built houses. These varied in shape from the tipi of the north to the circular wigwam or long domed structure of New England and the Middle Atlantic states (the Iroquois Long House, for example) to the rectangular thatched-roof house of the southeast. Most were framed of wood or saplings, covered with bark mats, thatch, or, in the western part of the area, by hides. Deer provided meat and clothing, and in the south plant fibers were also used. Pottery was known. Most containers and utensils were made of wood, bark, or basketry; other implements and weapons were of stone and bone. Around the Great Lakes, the gathering of wild rice provided sustenance where corn was not easily grown. Birchbark canoes and snowshoes in winter were frequently seen. Here too flourished the secret Midewiwin, or Grand Medicine Society, with its esoteric medicine bundles and ritual communication with the supernatural. Medicine societies among the Iroquois centered on curing rituals; members of the False Face Society wore grotesque wooden masks while performing a ritual to drive away evil spirits.

In the south, the Natchez of the Lower Mississippi were met by De Soto and other early explorers. The Natchez were famed for their worship of the sun and for the distinction among them of nobles and commoners. Later, some of them even emulated the colonists and owned slaves. A Cherokee named Sequoya deserves his fame, for he adapted the alphabet to the Cherokee language, then taught it to his people. Within a year (1820-21), the Cherokee were a literate nation.

Plains Indians. On the plains and prairies the way of life was very different from that in the woodland areas. Most inhabitants were speakers of the Hokan-Siouan languages, merging with Penutian speakers such as the Nez Percé; the Algonkin speaking Blackfoot and Cree; and the Cheyenne and Arapaho. Deer, antelope, and herds of buffalo provided material for housing (tipis were covered with skins), clothing (especially decorated robes), and food for many. Before the advent of horses in the 17th century, buffalo were stalked on foot. Baggage was placed in a skin bundle on poles harnessed to the back of a dog; this "travois" was later pulled by horses. Wild plants supplemented the game supply, but corn was not grown, nor did they make pottery. The advent of the horse increased their mobility, however. Since prestige was counted not only by quantity of horses but by bravery, raids for horses and to "count coup" (gallop in, touch the enemy, and return unharmed) became a way of life.

The Sun Dance was a ceremony shared by many plains tribes. Modified in form (without the self torture of aboriginal times), this rite is still held. There were clubs and societies for a variety of purposes, including the maintenance of law and order. Associated with them were ritual paraphernalia, songs, and dances. In the 1880's the Ghost Dance became popular among the plains Indians. Pressures of westward expansion, a depleted supply of buffalo, and reservation life combined sparked a reaction characterized by frenzied dances, the belief in communication with ghosts, and in a Messiah who would lead the Indians back to the good old days. In time it subsided, but its influence can be seen in the Native American Church.

Indians of the Plateau. Living in the forests and grasslands, these Indians shared the plains customs but in a different environment. Foods included wild roots, which were also cooked into loaves; and berries, which were also dried. Salmon were caught by spears or nets, the surplus being dried or smoked. Many of these peoples, such as the Palouse, Nez Percé, the Cayuse, and Molale, were Penutian speakers, and some, such as the Spokan, Flathead, and Pend d'Oreilles, were speakers of the Algonkin-Wakashan stock.

Great Basin Indians. The Shoshoni, Ute, Paiute, California Kern River, and Mono were speakers of the Aztec-Tanoan stock. An inland sea thousands of years ago, the great basin is now largely semidesert, making subsistence difficult. Small game and a sparse but great variety of wild plants, roots, and acorns provided subsistence where they were available. Brush shelters or windbreaks provided housing. Early observers watched these people digging roots and contemptuously named them the Diggers, yet they could live where their observers could not. These peoples, especially the Paiute, were good basket makers, and their works are prized in museum collections.

Indians of Southwest. The main inhabitants of the southwest (the states of Arizona, New Mexico, southern Colorado, and Utah) are two groups: the pueblo Indians and the southern Athapascans. The pueblos, while speakers of the Aztec-Tanoan languages, are further separated, one group living along the Rio Grande and the other in the western mesas. Languages and customs differ among these peoples. Pueblo dwellers live as did their remote ancestors, in apartment-house villages of adobe bricks. Corn is a staple crop, and orchards are now grown, as is cotton for clothing. Each pueblo village has its own distinctive style of pottery. Supernatural beings or gods, especially in the western pueblos, are called *kachinas.* Wooden dolls are carved to represent them, and at ceremonies they are impersonated by masked dancers. Among the Hopi, the Snake Dance is perhaps the most spectacular of the rites. Much of the ritual is secret, but on the last day performers assemble in the village plaza and dance with rattlesnakes, each for a time with one in his mouth.

Sharing the ecology, but by no means the way of life, are the Apache and the Navaho, Nadene-speaking Athapascan neighbors of the pueblo Indians. Geronimo was a well known Apache leader whose raids put fear into the frontier. The Apache were semi-nomadic, living in wickiups—brush or hide covered dwellings in the mountains. The Navaho, like the Apache, were hunters, but more sedentary, and they kept gardens. Their houses are called hogans, built of stout interlocked poles covered with mud. Later hogans were hexagonal in shape, built up like a log cabin. After 1800, the Navaho and some Apache extensively developed sheep herding. Sheep provide not only food, but pelts for bedding, cash sales, and wool for the weaving of fine blankets. Navaho work in silver and turquoise is also excellent.

West Coast Peoples. California is considered a single area of high diversification, but little is known of many of its peoples; they often became extinct or merged with neighbors before careful tribal records were kept. The last survivor of the Yahi, the southernmost Yana tribe, wandered into civilization in 1911; he died in 1916 (see ISHI, by Theodora Kroeber). These Indians hunted deer and small game, caught salmon, gathered roots and vegetables. Acorns were a staple food and were prepared in a number of ways.

The area known as the Northwest Coast extended from northern California to British Columbia and southeastern Alaska. Language stocks included the Algonkin-Wakashan (Yurok, Kwakiutl), Penutian (Chinook), and Nadene (Haida, Tlingit). These peoples lived in plank houses; a large carved totem pole often stood in front, representing the clan of the house owner. They hunted sea mammals and fished from long fire-hollowed boats. They had social classes, and raided neighbors for plunder and slaves. Chiefs vied with each other by giving "potlatch" feasts in which the host destroyed as many blankets, furs, copper plates, and shells as he could afford; the larger the destruction the greater the prestige of the chief. This was a form of conspicuous consumption not unlike the "keeping up with the Joneses."

RECENT CHANGES IN INDIAN LIFE

As the American continent became populated by Spanish, French, English, and finally American settlers, conflict often became a way of life, ultimately changing the aboriginal Indian ways or eradicating them.

A good many tribes in the east moved westward before the frontier, a process often repeated as white settlements extended. Wars on the plains and in the southwest were bitterly fought as late as the 1880's, and raids continued long after. Only the Seminole in Florida never actually conceded defeat. Government dealings with the Indians were by treaties until 1878; after that by Congressional enactment. Gradually most Indians were settled on reservations, where they often met disease, famine, and ill treatment by unsympathetic agents. In 1887 Indian land was authorized for individual rather than tribal allotment; remaining land was sold. As a result, Indian lands estimated at 138 million acres in 1887 dwindled to 47 million in 1934, when a new policy was adopted. Population also declined. An aboriginal population estimated at 1,153,000 was reduced to 269,388 by 1901; by 1937 it had climbed to 337,366; and by 1960, it had reached 552,228. Tribal lands were also stabilized; individuals wishing to sell their allotments would

do so to the tribe, in return for stock, thus halting the alienation of the Indian lands.

Supervision of Indian welfare is the duty of the Office of Indian Affairs, created in 1832. Many Indians served gallantly in World War II, but returned as heroes who could not vote. Citizens by act of Congress in 1924, they could not vote in some states until 1948.

In 1946 the Indian Claims Commission was established. Most of the claims brought against the government have been for insufficient payment for lands taken in the past.

There is still great variety in the life of the Indians of the United States. Some tribes, such as the Navaho, are collectively wealthy, although individuals may be poor; other tribes are relatively poor. Oil and uranium ores discovered on tribal lands have provided great wealth for some tribes. Sources of income are equally varied for individuals, and many skilled workers earn good wages; a number of industries have established factories near reservations to the mutual advantage of both the Indians and the industries.

In Canada, Indians were settled on reservations pursuant to treaties which called for distribution for each individual of a certain amount of money and provisions. They were regarded as wards of the government. In 1950, this system was superseded. Under the Indian Act of that year, Indians are citizens with voting and contractual rights and are liable to pay taxes. They are eligible for the social services open to all citizens. The department of citizenship and immigration is charged with looking after their interests both off and on reservations, these totaling 2265 covering nearly 6 million acres. The organizational unit is known as a band, of which there are 559. These are treated as municipalities for administrative purposes. Land in the reservations may not be sold without the department's consent. Indians are encouraged but not pressured to become integrated economically with the rest of the population, and about one-fourth of their numbers no longer live on reservations. The population, which had shown a decline prior to 1940, approximately doubled in the next 25 years to about 200,000.

Central and South American Indians. In Central and South America, native civilizations arose to vie with those of Egypt and Mesopotamia. The key to such civilizations was the domestication of maize (corn). Recent excavations in the Valley of Mexico show that squash-and-gourd agriculture was practiced at 7000 B.C. and that maize was first domesticated about 5000 B.C. in Mexico. Writing was developed in Mexico, though it is not readable today beyond dates, numbers, and the names of gods. South America never developed writing, though the civilizations of the Andean highlands developed a very adequate substitute, the *Quipu*. This looked like a string mop, made with colored strands knotted at intervals. These colors and knots were mnemonic devices used by professional "memory experts," the tax recorders of South American civilization. In many parts of both Central and South America, civilization brought central government, state religions, organized trade, and most notably monumental architecture. These peoples included Mayans, Toltecs, Zapotecs, and Aztecs of Mexico, and the Kechuan and Chibchan peoples of South America. They moved from localized village agriculture, to the development of ceremonial centers with temples, marketplaces, and palaces, and to a final stage in Central America of full-fledged cities of hundreds of thousands of occupants.

First American Civilization. As part of the development of the ceremonial center and the later city, there was also great specialization of trades, crafts, and even professions. Pottery and metallurgy became stable occupations. Classes of priests, astronomers, architects, and masons took on new importance. Trade was established between cities. In South America thousands of miles of guarded toll roads were built to protect the traveler from marauding natives. In Mexico and Guatemala, special laws were passed protecting the merchant and traveler. Gradually, in each area local government gave way to ever larger political entities. Finally, in Central America, the warlike *Aztecs* captured the reins of government of the most important Valley of Mexico. In South America, the *Incas* occupied the same position as a dominant, ruling class. While both centers of civilization had developed highly sophisticated arts and sciences, they were deficient in the art of war and were subdued and eventually subjected by Europeans with firearms and cannon.

Many legacies of these early American civilizations exist today, in items used and words spoken: tomato, potato, tobacco, quinine, hammock, hurricane, maize, chocolate, coca (and cocao and cocaine), and atlatl (Nahua for spear-thrower). Yet many more people lived in these areas who never did participate in the great civilizations or were only partly influenced by them. Further, as the leaders of the civilized nations and tribes were killed or imprisoned by the Europeans, the commoner members of these groups drifted off again into village agriculture, often as tenants with European landlords. As such they lost many of the traditions of their ancestors, particularly those related to civilized and urban life.

Central and South America today are a patchwork of aboriginal peoples, once-civilized peoples now less than such, and various combinations of each of these and European immigrants. In general, all may be classified as *Indios* (Indians, never civilized or driven from civilization), *Mestizos* (a mixture of Indian and Spanish, in culture or ancestry, often local businessmen), and *Ladinos* (those who claim Spanish descent, often erroneously).

Angles. A tribe which left northern Germany in the 5th century A.D. and established a settlement in eastern England. They gave their name in Germanic form to the country, England, and, in Latinized form, to the locality in which they settled—East Anglia.

Arabians or **Arabs.** The former name refers properly to the peoples of the Arabian peninsula, particularly the nomadic tribes such as the Bedouin. Arab is a more general term, referring to speakers of the Arabic tongue who are of Mediterranean racial stock. The Arab world of today extends from Morocco in the west to Oman in the east, from central Sudan in the south to Syria in the north. The Arab world displays many cultural variations, but they all look upon the Arabians proper as the ultimate example of an Islamic and Arab people. It was from stock such as the Bedouin tribesmen that Mohammed came, the prophet and founder of the Islamic religion. In Arabia lies the city of Mecca, birthplace of Mohammed and Holy City to the 500 million Moslems of the world, yet the Arabian peninsula has only twenty million natives. In the northern regions of Arabia, within the country of Iraq, the world's first civilizations developed.

The descendants of these civilizations became united in the Mohammedan religion during the 7th and 8th centuries A.D. This new Moslem civilization not only kept alive many of the discoveries of their own ancestors, but also much of the knowledge of the Greeks. A good deal of this knowledge filtered back into Europe during the Middle Ages and had a profound effect on the development of philosophy. Arab soldiers, traders, and missionaries greatly

expanded Arab influence and spread Islam throughout the northern half of Africa and through southern Asia as far as Indonesia, primarily from the 9th through the 14th century A.D. After a decline of 600 years, into semi-colonialism, the Arabs after World War II achieved independence as a number of nations above which Arabic unity hovered as an unrealized ideal.

Armenians. Speakers of the Armenian language, a separate division of the Indo-European stock, Armenians inhabit the area of Russia bordering on the eastern frontier of Turkey. The Armenian-speakers conquered and occupied this region several centuries B.C. and then interbred with the Turkic inhabitants.

The Armenians vie with the Ethiopians for the title of earliest Christian state, the Armenian Church having been founded in 301 A.D. by Gregory the Illuminator. Originally attached to the Eastern Rite of the Catholic Church, the Armenian Church broke off in 451 A.D. Today, for political reasons, the Patriarch of the Church resides in Turkey. In the past few centuries, many Armenians have espoused the Roman Catholic faith.

After an initial stable period, the Armenians have seldom been free from political domination by the Persians, Turks, and Russians. Armenia had one brief year of independence in 1919, when the Armenian Republic was declared after the fall of Czarist Russia, but it was soon incorporated into Soviet Russia. Prior to World War I, the Turkish government had set about the deliberate annihilation of the Armenians; the soviet domination was somewhat milder. As a result of such persecution, many Armenians left the area of their nativity and spread through parts of Europe, North Africa, and the Americas. In these areas they won recognition as businessmen, bankers, and teachers. The population of Soviet Armenia is approximately two million; but half that number of Armenians live in other countries.

Aryans. This name properly refers both to the invaders of India about 2000 B.C. and to the speakers of the Indo-Aryan family of the Indo-European stock. Sometimes Aryan is used to distinguish the Hindi speakers of India from the Urdu, Tamil, etc. Aryan is misused when applied to any racial group, though Hitler's Germany gave the term much local popularity; there is no Aryan race.

Assyrians. The Semitic speakers of the Assyrian Empire of the upper Tigris River in the region of modern Syria. The political domain began about 1600 B.C. and reached its height in the 7th century B.C. This was one of many tribal empires of the Middle East, and was contemporary with the Judaic peoples in the time of the Old Testament.

Aztecs. The name of the ruling tribe in the Valley of Mexico at the time of Spanish contact and for several hundred years before. The origins of the Aztecs are obscure, but they were a highland people speaking Nahua, a branch of Uto-Aztecan and ultimately Macro-Penutian, the largest stock of New World languages. Aztec is derived from *Aztlan*, meaning heron-place; the Aztecs were then the "heron clan." When the Spaniards came, seven major cities were united in the Aztec confederacy, but they controlled much more of Mexico than the area they occupied.

When first seen by Cortez, the Aztec capital of Tenochitlan was a magnificent city, with huge public buildings, wide highways, and a complex of canals. They had highly skilled engineers, architects, astronomers, masons, potters, and artists. They had highly developed the domestication of maize, which provided most of their sustenance. The Spaniards overthrew the government, confiscated the precious metal, and, with equal determination, extirpated their religion, which involved worship of naturalistic deities and the presentation of human and other sacrifices to these gods. The Aztecs ruled over the final, militaristic phase of Mexican culture, beginning with the Mayas. Today's descendants of the Aztec phase of Mexican culture still live in the Valley of Mexico, and many villagers do not yet speak Spanish.

Babylonians. The people of the great Mesopotamian civilization of Babylon, which flourished from approximately 2300 to 538 B.C. The first codification of human laws was handed down by the Babylonian king, Hammurabi, in the 20th century B.C.

Bantus. Generically, the several hundred tribes of South and Central Africa who speak languages of the Bantu family. These people occupy almost one third of the African continent. They are noted as cattle breeders, though the animals are usually kept as wealth, while basic subsistence comes from agriculture. Many Bantu tribes are noted for military skill. One tribe, the Zulu, in the early 19th century seized an empire larger than that of Napoleon.

Basques. The inhabitants of the Western Pyrenees mountains. They are distinct in race, language, and culture from the French and Spanish, between whom they live. Outwardly, they do not appear to be different from their neighbors, but in terms of the blood-group genes used by modern biologists to distinguish race they are very different. Most notable is the fact that they have no gene for blood type B, and they are the only human population in which the frequency of the gene for Rh negative blood is over 50%. This difference in race is strengthened by the fact that their language is unrelated to any other known language. They are believed to be the modern descendants of a very early European population, probably fifteen thousand or more years old.

The Basques are a proud people, still adhering to their own customs. They largely rule themselves, holding their own elections, and, well into the 20th century, collecting their own taxes and paying their own police force. In return, they paid an annual levy to the Spanish government. They are noted as herders, though they farm as well. Basque herders moved with the expansion of sheep herds across the western United States in the 19th century, and many are still to be found there today. Many more, perhaps 200,000, moved to South America.

Today small enclaves of Basques are to be found throughout the Americas, in North Africa, and in many parts of western Europe, as well as in their homeland. Around 750,000 still live in the Pyrenees, predominantly on the Spanish side. Perhaps another 300,000 live elsewhere.

Bedouins. See *Arabians*.

Belgae. The northernmost group of Celtic tribes which inhabited ancient Gaul. The Belgæ occupied the country between the Seine, Marne, and Moselle rivers and the ocean, which includes modern Belgium, together with portions of Holland and northern France. Some of the Belgæ settled in Kent and Sussex in southern Britain. In 57 B.C., Julius Cæsar conquered the Belgæ in a long, hard campaign, though part of the tribes revolted later. According to Cæsar, the Belgæ were the bravest of all the Gauls.

Belgians. The name applied to natives or citizens of Belgium, but not the name of a distinct race. Southern Belgians, for the most part, are Walloons, and northern Belgians are Flemish. See *Walloons, Flanders*.

Berbers. A people of North Africa whose ancestors inhabited the same region for perhaps 20,000 years. Mediterranean in race, they speak a language of the Hamitic branch of the Afroasiatic stock, thus ultimately being related to the semitic-speaking peoples of the modern and ancient worlds. Indeed, it was from the ancient Egyptians that they received first domesticated plants and animals, and later their metals. They have withstood many colonizations of North Africa, but only the expansion of Islam left a lasting effect, and today they are all Mohammedan and show many marks of Arab influence. A few even speak Arabic instead of Berber.

Today they are primarily pastoralists scattered around settled farmers of other origins. They are still noted for their ability in working metals. They are divided into 29 groups or tribes, though tribal organization is weak and government is by a democratic council at the community level. Their numbers today exceed 8,000,000.

Bohemians. See *Czechs*.

Boii. A Celtic people who emigrated from trans-alpine Gaul into Italy, where they occupied the old seat of the Umbrians, between the Po and the Apennines. In 283 B.C., the Boii were defeated by the Romans at the Vadimonian lake, and thereafter they prolonged their resistance to Roman arms through numerous campaigns, especially in support of Hannibal, but sometimes single-handed, till their complete defeat by Scipio Nasica in 191 B.C. They were subsequently compelled to recross the Alps, and they dwelt for more than a century in a part of modern Bohemia, which derives its name from them. They were ultimately exterminated by the Dacians. See *Bohemia*.

Bretons. About the 6th century B.C., the Celts of Gaul invaded Britain and, coalescing with the Iberians, founded the states later overthrown by the Romans. Upon the invasion of the Anglo-Saxons between the 5th and 6th centuries A.D., the British Celts who fled from England to avoid the Saxon domination crossed to the northwest of France and founded the Celtic state of Brittany, then called Armorica. These Celts are the direct ancestors of the modern Bretons, whose language is closely allied to the Welsh and the now extinct Cornish languages. It is spoken by over 1¼ million persons. Of its four dialects *León* is the purest and *Cornuallais* the most widely spread. See *Brittany*.

Britons. A people, largely of Celtic origin, who inhabited England at the time of Julius Cæsar's visit. They had a highly developed druidic religion. Young men in Gaul who wished to be priests were sent to Britain to be educated.

Bulgars. An Asiatic race akin to the Huns. When first known, they were nomadic horsemen, fierce and barbarous, who migrated westward behind the Huns. In the 4th century A.D., they conquered the region between the Volga and the Urals. Later they formed a state north of the Black Sea. In the 7th century, they menaced Constantinople. Settling down, they gave their name to the region now known as Bulgaria.

Burmese. Inhabitants of Burma or speakers of one of the dialects of the Burmese language. Burmese constitutes a separate branch of the Sino-Tibetan stock, which also contains Chinese, Tibetan, and many other languages of southeast Asia. Racially as well they are similar to the Thai, southern Chinese, and others in southeast Asia. The Burmese people are highly developed agriculturalists, raising cereal grains along the drainage of the Irawaddy River and its tributaries. This river complex really constitutes Burma, as the borders of the country lie in the high mountains and open coast surrounding the rivers. The Burmese are strongly Buddhist, and the country abounds in shrines and temples. They have had a constitutional government since their separation from British rule in 1947. U Thant, a Burmese Prime Minister, was appointed Secretary General of the United Nations in 1961. The nation has over 25 million people.

Bushmen. A modern stone-age people of the South African desert. A branch of the Khoisan linguistic stock, the Bushmen are the descendants of peoples who have inhabited the southern portions of Africa for tens of thousands of years. They are nomadic hunters, living on the edge of survival. They were pushed from the plains into the desert by the expansion of the Bantu peoples less than 2000 years ago. See *Bantu.*

Catalans or **Catalonians.** The people inhabiting Catalonia, the northeastern division of Spain. They extend northward over the Spanish boundary into France, and their language, called Catalan, is distinct from both the Provençal of southern France and the Castilian of Spain. Castilians can understand the speech of Portuguese more easily than that of Catalans, and the rapid enunciation of the Catalan adds to the difficulty.

Caucasian. This term is usually used to refer to the so-called "white" or "European" race, though most modern anthropologists hold that such an inclusive racial category is almost meaningless. European peoples of today are divided into several separate races which grade into neighboring races outside of Europe. "Caucasian" was originally used in the belief that the peoples of the Caucasus mountains were the most typical representatives of the "race." It is to these peoples that the term is best applied, though as a linguistic term. There are some 4 million people who speak languages of the Caucasian stock, which is not related to Indo-European. Of these the best known is Georgian, in which written records go back some 1000 years.

Celts. A vague term which names the large group of peoples, of mixed race but using a common language, whose early home, about 1000 B.C., was in the upper valleys of the Rhine and the Danube. From this center they spread west, south, and east. One branch became the Galatians of Asia Minor; another, the Gauls of western Europe. In Italy, as early as the 4th century B.C., they made large settlements in the valley of the Po, a region from which afterward came Virgil, Catullus, and other men of note in Latin letters. In the East, they served as mercenaries in Africa and Asia. They were known to the ancients by many different names, and there seem to have been two distinct physical types among them, one tall and fair, the other short and dark. On the continent, the Celts succumbed to Roman and Germanic conquest. At the present day, they are represented most conspicuously by the Irish, the Welsh, and the Highland Scotch.

Chinese. In common use, the name of the inhabitants of the country of China but more properly referring also to the many Chinese-speaking peoples in China and scattered throughout the world. Racially, the peoples of China show many gradations from the burly, dark-skinned peoples of the north to the rather slight, light-skinned peoples of the south. The northerners appear to be most like their Manchurian and Mongolian neighbors, but the southerners are much more like the Thai or Malay. Except for small areas, one or another of the many dialects of Chinese is spoken throughout the realm. But these are often not mutually intelligible, so the Mandarin dialect serves as a common tongue for all educated Chinese. For over 2000 years up to the beginning of the 20th century, the major emphasis on Chinese life was upon the extended family and the clan; the major value was filial piety. An individual had very little freedom until he became a grandparent and head of his family group. The lessons of the past were regarded of more importance than the doubtful future. This is especially a tenet of the Confucian religion which dominated Buddhist and Taoist religions in classical China. Until this century, government was in the hands of local administrators appointed by the Imperial Court, the first of which predates 1800 B.C. The Chinese are noted for their acumen in business and commerce, and their commercial communities exist in most countries and all continents, though Hong Kong, Singapore, and Macao are the largest.

The impact of western civilization has been great, though turmoil has characterized this nation since the overthrow of the last Manchu dynasty in 1911. The value placed by the classical Chinese on family and on the past have made transition to the modern world difficult. The effort to industrialize has been sped up by the Communist government which took over rule from the Nationalists in 1949. Many of the latter followed their leader, Chang Kai-shek, to form a second Chinese nation on the island of Formosa (Taiwan). Estimates give over 800 million Chinese on the mainland, over 12 million on Formosa, and some 5 million scattered elsewhere.

Circassians. The name applied to people inhabiting the northwestern part of the Caucasus. Their name for themselves is *Adighe;* the Turks and Russians call them *Tcherkasses,* or "brigands." Both Circassian men and women are noted for physical beauty, and many Circassian girls entered Turkish harems. After the Russian conquest of their territory in 1864, several hundred thousand of them emigrated. Among the upper classes, Mohammedanism is the chief religion; among the lower classes, this is mixed with vestiges of earlier religions.

Copts. Followers of the Coptic rite of the Christian faith. They began by translating the scripture into Egyptian and other native languages of northeastern Africa, and broke from the mother Church in the 5th century. Egypt, Nubia, and Ethiopia all had large numbers of the Coptic faith. In the former two, the persecutions of Byzantium and the propagation of Islam almost erased the Coptic faith. Today there are perhaps 25,000 Egyptian Copts under the Patriarch of Alexandria, and the Sudan (Nubia) has far fewer. However, in Ethiopia the Coptic Church is the official state church and is independent of the Egyptian. See *Egypt, Ethiopia.*

Cossacks. The inhabitants of the southern and eastern frontiers of Russia. The most important of these communities were those of the Dnieper and the Don. Until the reign of Catherine II, they retained a certain degree of independence with a kind of democratic government, at the head of which was their "hetman." In lieu of taxes, they supplied the Russian empire with a most valuable military force of cavalry and scouts. In 1918 the Cossacks proclaimed a Republic of the Don, but they were later overrun by the Soviet forces.

Croatians. A southern Slavic people whose language differs but slightly from that of the Serbians, with whom they are commonly grouped as Serbo-Croatians. The Croatians are most numerous in Croatia, Slavonia, Dalmatia, and Bosnia, former provinces of the Austrian empire and now included in Yugoslavia.

Czechs. A northern group of the Slavic peoples who were living in Bohemia, Moravia, and Austrian Silesia as early as the 5th century. Their struggle against Habsburg tyranny started the Thirty Years' war. After the French Revolution they began a revival of their literature, a movement which became political in 1848. The Czechs united in 1918 with their neighbors, the Slovaks, to form the republic of Czechoslovakia.

Danes. A northern European tribe which, in the 5th century A.D., drove the Saxons and the Angles from Jutland and from the adjacent islands. Most of them remained in the country which has become Denmark, but others settled in England in the 9th and the 10th century.

Dorians. A race of people in ancient Greece who are believed to have come from the north and conquered the Peloponnesian peninsula before 1000 B.C. In Sparta, the leading Doric state, the conquerors held the subject population in rigorous servitude. Thence arose the conception of the Dorians as aristocratic and warlike in temper as opposed to the Ionian peoples, among whom the leading state was Athens, the extreme exponent of democracy.

Dravidians. The non-Aryan people who inhabit the southern part of India and Ceylon. They occupied the country before the coming of the Aryans. Their languages, of which there are more than a dozen, constitute a single group. Some of the tribes are of a very low type of civilization, but the Tamils and Telugus have attained a high culture and produced excellent literature and architecture. The religion of the Dravidians varies from rude nature worship to a borrowed Islamism or Hinduism.

Egyptians. The ancient Egyptians spoke a language of the Hamitic branch of the Afro-Asiatic stock. To them the world owes one of its two oldest centers of civilization and one of its two earliest written languages. Egyptians lost their national independence to the Romans in 30 B.C. With the spread of Islam in the 8th and 9th centuries, they almost all abandoned Coptic Christianity and adopted the Mohammedan faith and with it their own version of Arabic, a Semitic language of the same stock. In physical type, they are of the Mediterranean race. See *Copts, Egypt.*

Eskimos. The inhabitants of Arctic America, from the Bering Straits to Greenland. They were the last native people to enter the New World and show many similarities to the peoples of northeastern Siberia.

Ethiopians. The many and varied peoples of the country of Ethiopia. There are over 80 separate languages in Ethiopia, though all belong to either the Hamitic or the Cushitic branches of the Afro-Asiatic stock. The people grade from dark-skinned Mediterranean in the northeast to Sudanic in the west and to East African in the south. Culturally, most fall into three main groups. First are the Amhara and related peoples of the north. These are Coptic Christians, and they claim descent from the Queen of Sheba. They have ruled the north for many years and all of Ethiopia for the last hundred years. Second are the Gallas, several groups of pastoral peoples inhabiting the plains of the central, western, and southern regions. They are primarily Mohammedan, though some are pagans, and are noted warriors. Lastly, there are the highland agriculturalists of the western and southern regions; these are almost wholly pagan. See *Copts.*

Etruscans. An early people who inhabited Italy north of the Tiber, but whose culture and language were distinct from those of other Italian peoples. By some they are thought to have come from Asia Minor; by others, from Africa. They developed a considerable commerce and art, and at one time conquered Rome. The inscriptions left by them have not yet been deciphered.

Fellahs or **Fellahin.** The name by which the settled agricultural peoples of the Arab world are known, in contrast to the wandering Bedouin. It is more often applied to a class of agricultural laborers or peasants in Egypt and the Middle East.

Filipinos. The Malay inhabitants of the Philippine Islands. The earliest occupants of the islands are thought to have been the Negritos, or pygmy Negroes, about 25,000 of whom are still found in the interior of Luzon. At some remote period there occurred a series of Malay migrations. These immigrants scattered over the islands in small groups with different dialects and local customs. Like their modern descendants, such as the Igorots, they were headhunters and warriors. In the northern highlands of Luzon, some of them developed a remarkable system of irrigated mountain terraces for the cultivation of rice. Probably they brought with them a knowledge of ironworking.

Later Malay migrations brought the people represented by the three most important tribes of the present time, Visayans, Tagalogs, and Ilocanos, to whom the name Filipinos is often restricted. Of these, the Tagalogs, who are the most numerous of the inhabitants of Manila, central Luzon, and Mindanao, are the most highly civilized group. The Moros of the southern islands are Mohammedan Malays who followed the other migrations. Since the beginning of the Spanish occupation of the Philippines, intermarriage of Filipinos with Spaniards, Chinese, and Mexicans has produced a large group of mixed ancestry, called *mestizos,* who are the eaders in government and business. See *Philippines.*

Finns. The inhabitants of Finland and neighboring parts of Russia. They are linguistically related to the Hungarians and Estonians, as well as to the Lapps and other native Siberian peoples. Physically, they are northwestern European blended with northeastern European. The former probably came with the conquest of Finland by the Swedes in 1157, which also brought Christianity to the Finns. Though less than 5 million in number, they wrested independence from Russia in 1917, and have given the world the music of Jean Sibelius and their own classic epic, *Kalevala,* from which Longfellow borrowed the meter for his *Hiawatha.* See *Finland.*

Franks. A group of Germanic tribes which from the 3d century A.D. were allied with the Romans and, after the overthrow of the Empire, conquered Gaul. The Franks established a kingdom there under Clovis and gave their name to the country which we now call France.

Frisians. An ancient Germanic people who inhabited the extreme northwest of Germany between the mouths of the Rhine and Ems. They were subjected to the Roman power under Drusus and were later subdued by the Franks. On the division of the Carlovingian empire, their country was divided into West Frisia (West Friesland) and East Frisia (East Friesland). The language of the Frisians is closely akin to the Anglo-Saxon. Our knowledge of the old Frisian is derived from certain collections of laws, called the "Asegabuch," composed about 1200. Modern Frisian is split into many dialects, but the greater part of its literature is written in West Frisian.

Gauls. See *Celts.*

Goths. A powerful German people who originally dwelt on the Prussian coast of the Baltic at the mouth of the Vistula. They later migrated to the south. About the beginning of the 3d century we find them separated into two great divisions: the Ostrogoths, or Eastern Goths; and the Visigoths, or Western Goths. The meaning of *Goth* is said to be "nobly born."

Gypsies. The English name for a series of wandering tribes of Europe and later of the Americas. They call their language *Romany,* and its basic words are linked to the Indo-Iranian family of Indo-European. Blood group analysis also suggests an Indian origin. Protected only in Scotland, the Gypsies have been persistently blamed for anything happening in their vicinity, from theft to witchcraft. In language and culture, each Gypsy group shows many traits of the host country in which it lives.

Hamites. Once used as a racial term (the descendants of Ham, son of Noah), this term refers more appropriately to the speakers of the languages of the Hamitic family of the Afro-Asiatic stock. As such, Hamites would include Berbers, Ancient Egyptians, Amharas, and others. See *Berbers, Egyptians, Ethiopians.*

Helvetii or **Helvetians.** An ancient Celtic people, who, in the 1st century B.C., lived in the country between the Rhone and Rhine rivers and between the Jura mountains and the Rhaetian Alps. Their territory was somewhat smaller than modern Switzerland. Cæsar opposed their migration into Gaul and drove them back into their mountains, with great slaughter. In the reign of Vitellius they were again mercilessly attacked. After this they disappeared from history.

Hindus. The name is commonly applied to all the inhabitants of India, but it properly indicates only the Aryan people of the north central portion of the peninsula. At a very early period, this people descended into India from the northwest and crowded the inhabitants, known as the Tamils, toward the south. The religion of the Hindus is the ancient Brahmanism, which dates from the period of the *Vedas.*

Hittites. This people appears in history at 2000 B.C. in central Asia Minor. Their language is classed by some as belonging to the Indo-European group, by others as a sister tongue derived from an older common source. The Hittite military empire competed with the Egyptian and Assyrian until its fall around 1200 B.C.

Hottentots. A people of South Africa, physically and linguistically related to the Bushmen though showing some admixture with the Bantus. It was from the latter that the Hottentot acquired cattle. The territory of the Hottentot has been much reduced, first by the Bantus and then by the Dutch settlers.

Huns. A people, probably of western Asian origin, who are first noticed in history about 375 A.D., when they moved westward into the Danube valley. A half century later they became the terror of Europe. Under their vigorous leader, Attila, whose boast it was that grass never grew again where his horse's hoofs had trod, they swept across the Rhine, burning and devastating. Their host included conquered Ostrogoths and many other tribes. The Romans and their allies, the Visigoths, Burgundians, and Franks, met and defeated the Huns at the battle of Châlons in 451. Within a few years they withdrew to Asia or mixed with their conquered tribes, leaving only their name as the synonym for barbarous cruelty.

Incas. A civilized people formerly inhabiting the highlands of Peru, Bolivia, and Ecuador. They were subjugated and almost exterminated by the Spaniards in the 16th century. Our knowledge of the people is derived mainly from accounts left by their conquerors. Like all other South American peoples, they had no written records. Their language survives, however, as *quechua,* which is spoken by several million people.

Inca builders showed a rare skill in the cutting and fitting of stone for their buildings, which were often of immense size although they had neither iron nor wheels. They were skilled also in the working of precious metals. They

excelled in road building. From about 1100 to 1400 A.D., they built up an extensive empire.

Indians. See *American Indians, Hindus, Dravidians.*

Iranians. The settled Persian-speaking peoples of modern Iran, as opposed to the Kurdish tribesmen. See *Kurds.*

Irish. The name applied generally to the people of Ireland. In the population of the island, however, are included three physical types: (1) a short, dark-haired type, representing the primitive race; (2) a taller, blond type, representing the Tuatha De Danaan (tribe of the goddess Danu) of Irish tradition; (3) the Celtic, which is the dominating Irish type of the present day, representing that of a people who conquered the island probably within historic times.

Israelis. The population of the state of Israel. People of the Jewish faith, though of many races and nationalities, have added their numbers to the indigenous peoples of Israel. They number close to 3 million, and include 8 per cent Moslems and approximately 7 per cent other religions.

Japanese. The dominant population of the Japanese Islands, as opposed to the *Ainu*, the remnants of the aboriginal inhabitants. The Japanese speak a language unrelated to any other in the world, though in their writing they make frequent use of Chinese characters. Racially, they belong with the Koreans and Mongols, members of the classic mongoloid race.

Kazak. These are the nomads of the central Asian steppes, together with the Kirghiz and Kalmucks. All claim descent from Ghengis Khan. The Kazak and Kalmucks were horsemen exclusively; the Kirghiz also used the Yak. All were noted as fearless warriors. Today all have been to a large extent made farmers on Soviet or Chinese collective farms. The Kazak and Kirghiz are primarily Mohammedan; the Kalmuck exhibit Buddhist influence.

Kurds. A primarily nomadic people of Indo-Iranian language and physical type who live in Iraq, Iran, Turkey, and Afghanistan. They live their own lives, paying little attention to the rules of the country in which they live. They have a thin veneer of Mohammedan religion.

Lapps. The reindeer breeders of Arctic Scandinavia. They are closely related to the Finns, though lacking the industrial and political development of the latter. Nominal Christians, they still follow their older, Shamanistic religion.

Lithuanians and **Letts.** Peoples speaking languages of the Baltic family of Indo-European. Lithuanians are similar in culture to the Latvians and Estonians, but are historically of different origin. Alternately under domination from west or east, these two peoples and their Baltic neighbors have preserved their cultural independence.

Lombards. A Germanic people, originally from the region of the lower Elbe River. Not very numerous but of distinguished valor, they played an important part in the early history of Europe. The name may have been given with reference to their long beards. About the 2d century A.D., they seem to have begun to leave their original district and to have fought their way south and east till they came in close contact with the Eastern Roman Empire on the Danube and adopted an Arian form of Christianity. After having been for some time tributary to the Heruli, they raised themselves upon the ruins of their power and of that of the Gepidæ, shortly after the middle of the 6th century, to the position of masters of Pannonia and became one of the most wealthy and powerful nations in that part of the world. Under their king, Alboin, they invaded and conquered the northern and central parts of Italy (568–572). The conversion of the Arian Lombards to the orthodox faith was brought about by the policy of Gregory the Great and the zeal of Theodolinda, wife of Authari and subsequently of his successor, Agilulf (590–615). Charlemagne put an end to the Lombard kingdom in 774.

Magyars. The ancestral people of Hungary, whose descendants make up perhaps about two-thirds of the country's present population. They are of the same origin as the Finns, Hungarian being the other major branch of the Finno-Ugric linguistic stock. Western Asia is the most likely point of origin of the Magyars.

Malasians or **Malays.** The physically and linguistically related peoples of the Malayan peninsula and of the islands of Sumatra, Borneo, and Indonesia generally. Though of similar origin in southeast Asia, these people display marked cultural diversity. Speaking languages of the Malayan branch of the Macro-Malayopolynesian stock, they are also related to almost all of the Pacific Islanders.

Manchus. The Mongol or Tartar people who overran China in the 12th century and again in the 17th century. They established the dynasty which ruled China until their overthrow in 1911. They made the wearing of the *queue*, or single pigtail, mandatory for the Chinese as a sign of subjection to Manchu authority. See *China, Chinese, Tatars.*

Maoris. The native Polynesian people of the Islands of New Zealand. Unlike other Polynesians, the Maoris were once principally hunters, stalking the huge wingless bird, the Moa. These huge birds were hunted to extinction before the first European arrived at New Zealand, by which time the Maoris had returned to agricultural pursuits. To a great degree, the Maoris have kept pace with the progress of New Zealand.

Masai. These are a very tall, Sudanic speaking people of Kenya. Living by herding vast numbers of cattle, the Masai are noted warriors, lion hunters, and athletes. The majority of them have chosen to ignore the blandishments of 20th century civilization and steadfastly follow their traditional nomadic life.

Mayas or **Mayans.** A group of related peoples in southern Mexico and Guatemala. In pre-Columbian times, the Mayas had achieved a highly developed civilization, but since the conquest most have remained peasants under the domination of Spanish descendants.

The ancient Mayas had developed the arts and sciences to a degree unknown elsewhere in the New World. Their system of writing, as yet only partly understood, served as a basis for later Mexican writing. They erected many monumental buildings, especially temples. They had invented the cipher (zero) long before its use in Europe. Corn (maize) was almost certainly first cultivated by these people. The height of Mayan civilization lasted from perhaps 1000 B.C. to 1000 A.D., after which the Mayas came under the domination of the Toltecs. See *Toltecs.*

Minoans. Taken from the name of their legendary king Minos, this is the name given to the people of the Mediterranean island of Crete, especially during the period of their dominance in the area about 2500 to 1000 B.C. The language of the early Minoans does not seem to have belonged to the Indo-European group, but they later spoke a form of Greek. Some experts believe that a fragment of the Minoan population left Crete after its power had failed and established the five Philistine cities which oppressed the Biblical Hebrews.

Mongolians. This term used to apply to all Asiatic races and often American Indians as well. This was a mistaken application as there is far more diversity among Asian races than had been thought. Today the term is best applied racially to the "classic mongoloid" peoples, the Mongols themselves, the Koreans, and the Japanese.

Mongols. The native peoples of Mongolia, now politically divided into two states, Inner and Outer Mongolia. Most Mongols are nomadic herders, gathered into local bands under tribal chieftains. The Mongols produced two famous conquerors—Genghiz Khan and his grandson Kublai Khan. The former established a brief empire which extended from eastern Asia to the gates of Vienna; the latter established the first Manchu dynasty in China. Today, approximately 5 million Mongols live in western China, the eastern Soviet Union, and in the independent Republic of Outer Mongolia. The latter switched its primary allegiance from Communist China to Russia in the mid-1960's.

Moors. The people of Morocco, where the Arab conquerors of the 7th century mixed with the natives of the Roman province of Mauretania. The Spaniards designated as Moors the invaders of Spain in the 8th century, and the term was loosely extended to all Mohammedans of northern Africa. See *Morocco, Spain.*

Moravians. A Slavic people which in the 6th century displaced Germanic tribes in the valley of the Morava River, south of Silesia. In the mild climate of their district, they have a wide variety of agricultural products, and their flocks produce a fine quality of wool. In religion they are mostly Roman Catholic. After World War I, they were included in the republic of Czechoslovakia. See *Moravia.*

Negritos. The name, meaning "little negroes," has been applied to the small statured, frizzly-haired populations of Southeast Asia and the off-shore islands. India, Malaysia, the Philippines, and New Guinea all have such populations, and the Andaman Islands have only them. They are normal in all aspects save their stature. Their origins is still obscure, though probably of great antiquity. See *Filipinos.*

Negroes. This term has had many meanings. Coming from the Spanish and Portuguese *negro*, it stems from the Latin *niger*, black or dark. It was applied as early as the 15th century by the Portuguese to the dark-skinned peoples

of Africa. Later it was extended to all people with some African ancestry. Thus applied to all sub-Saharan Africans and their descendants, the term is notably incorrect.

Traditionally, anthropologists have classified most of the peoples of the world in accordance with inherited physical characteristics as Negroid (dark-skinned), Caucasoid (white), and Mongoloid (yellow).

Negroid racial stock, in general, falls under two main subdivisions: African Negroids and Oceanic Negroids, inhabiting the Melanesian islands of the Pacific. A minor group, pygmy Negritos, inhabit areas of the Pacific.

In popular usage, Negro has had different meanings in different places. Throughout the United States, persons who are known to have a Negro ancestor are generally considered Negroes, even though their skins may be white. Some dark-skinned peoples—the aborigines of Australia and some ethnic groups of India—are not typified as Negroid; they include Negroid mixtures, but they are considered Caucasoid. In Latin America and some other areas, physical characteristics are considered of less importance than social or economic status.

The continent of Africa has several differing races, such as the Bantu, Forest Negroes, Sudanic, East African, and others. The New World populations with African ancestry also have many European ancestors and are typically distinct from any native African populations. The term Negro has more meaning when applied to the colored populations of North America, although it then cannot be applied to another human population. When used for people of African ancestry, the term becomes sociological and psychological, rather than clearly descriptive of physical category.

The black peoples first encountered by the Portuguese were well-organized kingdoms of West Africa, such as the Ashanti, the Dahomey, and the Yoruba of the Gold Coast and Nigeria. Such peoples were known to the ancient Hebrews and Egyptians. Slavery had been an active institution from these early ages and persisted into modern times. The slave trade was to become uneconomical with the expansion of trade and the spread of industrialization. But with the opening of the New World, a highly profitable slave trade was developed. The slave trade was the source of the Negroes of the New World. Slaves were brought to the Western Hemisphere to replace the Indian workers of Latin America who had been decimated by the Spanish. Negroes were also imported in large numbers to provide labor for the plantations of North America.

These African slaves, primarily Forest Negroes, were brought in large numbers to the Americas from the 16th to the 18th century. Those in South America were afforded some human rights through the Church; they were allowed the sacraments and families were treated as inseparable. In North America, the slave was little more than property. The entire pattern of southern agriculture was tied to slave labor. In some areas slaves were well treated, in others their treatment was brutal. From the earliest days the Negro slaves sought freedom, which finally became legally effective in the middle and late years of the 19th century in the various nations of America—in the United States after the Civil War and the passage of the 13th Amendment in 1866; in Brazil in 1871; in Puerto Rico in 1873; and in Cuba in 1880.

By 1860 there were some 4,400,000 Negroes in the United States, of whom only 400,000 were free citizens. At present, there are about 25 million Negroes in the United States; some 30 million in Latin America; 125,000 in Europe; and about 35,000 in Canada.

The 13th and 14th amendments to the U. S. Constitution gave the Negro nominal rights, but they were seldom given actuality except in the few years immediately following the Civil War. In spite of the strides taken by a few individuals, major advancement to full citizenship for the American Negro did not really begin until the mid-1950's with the several decisions of the Supreme Court against segregation, first in the schools and then in other places and accommodations.

Since World War I the Negro population of America has been leaving the South, seeking new occupational opportunities in the North and West. Here, too, they met antagonism and prejudice, which gradually yielded to legal pressure and changing attitudes.

The Negro has left his own particular mark upon American culture. While many Negroes have made major contributions to the arts and sciences, jazz music and the spiritual are uniquely American idioms, deriving principally from American Negro traditions.

Normans, Northmen, or Norsemen. The sea rovers from Scandinavia who, in the early Middle Ages, ravaged the coasts of England, Germany, and France and established themselves in various parts of western Europe and Russia. They were called Danes in England, where they gained a foothold in the 9th century, after having made settlements in Ireland. In the 11th century, Canute and two successors ruled England for about 25 years.

Meanwhile, other bands had settled in northern France and compelled the French king to give his daughter in marriage to Rollo, their chieftain. Rollo embraced Christianity and became Robert, first duke of Normandy. The name Norman is usually restricted to these settlers in France, who assimilated the culture, language, and religion of the Frankish kingdom. William, Duke of Normandy, led the Normans into England in 1066 and was known thereafter as William the Conqueror. Norman nobles also became rulers in southern Italy and in Sicily. Norsemen are believed the first Europeans to visit North America.

Parsees or Parsis. The modern followers of Zoroastrianism, which was the ancient religion of Persia. They are popularly called "fire worshipers," but to this designation they strongly object, since the fire to them is simply one of the emblems of the power of their god Ormuzd. Their beliefs have changed somewhat since ancient times, but they are still scrupulously careful about purification.

After the Mohammedan invasion of Persia in the 7th century, several bands of Zoroastrians emigrated to India, and from these have sprung the Parsi communities of present-day India. They are most numerous in the vicinity of Bombay. They are leaders among Oriental peoples in education.

Philistines. A Semitic-speaking people of the Middle East. Mentioned in the Old Testament as a neighboring people to the Israelites, today few Philistines still exist, living primarily in Israel and secondarily in Jordan.

Picts. The early inhabitants of the northern part of Great Britain. They were called Caledonians by the Romans, the name Picts being given later because of their custom of painting the skin. The origin of this people is uncertain. They carried on continual warfare with the Romans, who built long walls to keep them out of the southern provinces. In the 7th century the Saxons came into conflict with them. After their conversion to Christianity, their king Angus MacFergus ruled all Scotland for a period in the early part of the 8th century. About the beginning of the 9th century, they disappeared as a separate people, leaving no literature and but scanty traces of their language.

Polynesians. The name applied to the inhabitants of the eastern Pacific Islands from New Zealand in the southwest to Hawaii in the northeast. All are physically similar and speak similar languages. Polynesia was the last area of the Pacific to be occupied in historic times, these peoples having settled there in the first few centuries A.D.

The origins of the Polynesians lie in Southeast Asia or Indonesia, to whose original occupants the Polynesians are far closer than they are to the Micronesians or Melanesians. The Polynesian peoples are sailors of renown and good fishermen, but their basic staples are tree and root crops. The exception to this pattern were the Maoris, who spent several centuries as hunters of a bird, the Moa. Polynesian contact with South American civilizations certainly did occur, and even perhaps with the civilizations of Mexico. However, no significant immigration from the New World occurred, as shown by evidence of language, race, and culture.

Pygmies. The term applied to a number of widely varied human populations. Pygmy is best applied to the small-statured, frizzly-haired peoples of the Congo rainforests of Africa, as opposed to the Negrito populations of southeast Asia. The African pygmy lives in symbiotic relationship with the surrounding peoples. He exchanges his hunted meats for many more calories of agricultural products. Each side gets what it wants.

Two theories of pygmy origin conflict. One states that the pygmies are a very old population, having inhabited the Congo area for tens of thousands of years. The other proposes that they are a late adaptation to crowding and reduced food supply. In either case, the pygmy is very unlike the small-statured populations of Asia. See *Negrito*.

Rumanians. A people of mixed race who, since the 12th century, have occupied the territory north of the lower Danube and the slopes of the Transylvanian Alps. Most of them now live in Rumania, although there are scattered communities throughout the Balkans. They speak a Romance language which closely resembles the Latin. Scholars now believe that the Roman colonists of the Province of Dacia, established along the lower Danube by Trajan, withdrew to the Illyrian coast before the inroads of barbarians but later re-entered the Danube country, preserving their Latin speech in spite of mingling with Slavic, Greek, and Turkish peoples. See *Rumania*.

Samoans. The Polynesian people of the Samoan Islands. See *Polynesians*.

Saracens. A name derived from an Arabic word meaning "rise." It was applied in the 1st century A.D. to a tribe in northwestern Arabia. Later, the name was used by medieval writers to designate all Mohammedans.

Saxons. A Germanic people first heard of in the 2d century A.D. as inhabiting what is now southern Denmark. They migrated southward, subdued all northwestern Germany, and invaded the Roman Empire. In the 5th century they invaded Normandy, and, in that and the next century, many settled in England. The Saxon strain is very prominent in the modern population both of Germany and of England.

Scots. Scotland takes its name from a group of Gaelic invaders, called Scots or Dalriads, who came from Ireland in the 3d or the 4th century A.D. The strongest of the earlier inhabitants were the Picts, also a Celtic people. The Angles, or English, early established a kingdom in southern Scotland, and Scandinavian immigrants were mingled with these people of the Lowlands as well as with the Highlanders. In many parts of North and West Scotland, known as the Highlands, a Gaelic tongue is spoken; the dialect of the South and East Lowlands is a mixture of English and Scandinavian speech. See *Picts*; *Scotland*.

Scythians. An ancient nomadic warrior people, famous as horsemen and bowmen, who inhabited what is now southwestern Russia. Herodotus and other Greek writers describe this wandering tribe as living in tent-covered wagons. They were conquered by neighboring tribes and disappeared from European history in the 2nd century B.C. The name Scythian was later used loosely for any northern and central Asiatic tribes.

Semites. Properly referring to the speakers of the Semitic family of the Afro-Asiatic stock, Semite is more often applied to any people of the Middle East and, most restrictively and inaccurately, to persons of the Jewish faith. The Semitic peoples are those who speak Arabic or Hebrew today, though in ancient times the group included the Sumerians, Babylonians, Assyrians, and many other of the ancient civilized peoples of the Middle East. See *Arabs*, *Israelis*.

Serbians or **Serbs.** The group of southern Slavic peoples who occupy the former kingdom of Serbia and neighboring lands of Croatia, Bosnia, and Dalmatia. They joined with the Croats and Slovenes in 1918 to form the Kingdom of Yugoslavia. The term Serbo-Croatian is frequently used to include the Serbs and Croats, who differ only slightly in language. The Croats are Roman Catholics, while the Serbs are mostly of the Greek Catholic faith. An interesting national characteristic of the Serbs is the love of all classes for their legends, ballads, and romances about old national heroes. See *Croatians*, *Yugoslavia*.

Sicilians. The earliest known inhabitants of Sicily were the Siculi, who gave their name to the island. In historic times, Phoenicians, Greeks, Romans, Saracens, Normans, Germans, French, and Italians have at different times ruled and colonized Sicily. The Sicilians have long had an unenviable reputation for turbulence and violence, a temper probably the result of centuries of backward economic and social conditions due to the repeated struggles of many nations for possession of the island.

Singhalese or **Ceylonese.** The native peoples of the island of Ceylon, off the Indian coast. The Singhalese language is derived from Hindi, the Indo-European language of India. But there are many other languages spoken on Ceylon, notably of the Tamil group from eastern India. The people of Ceylon display much of the racial diversity of India and Pakistan, whence most of its peoples came.

Slavs. This term refers to the speakers of the Slavic languages—Russian, Serbo-Croatian, Czech, Bulgarian, and Polish plus many smaller languages. It is also used to refer to the peoples of the Northeastern European race, sometimes called Slavic. Probably originating near the Baltic, the Slavs seem to have had two major migrations. One, about the 4th century A.D., took many of these people down to and along the Danube Valley and across the mountains to the Adriatic. A second migration was to the east, where they displaced other peoples and founded the nucleus of the many Russian peoples.

Slovaks. The Slavic people who for several centuries maintained an independent kingdom on the south side of the Carpathians and in the 9th century formed the basis of the Moravian state. Conquered by the Magyars, many of them became scattered over Hungary. After World War I they united with the Czechs in the republic of Czechoslovakia. The Slovak dialect possesses numerous very beautiful popular songs, many of which have been collected and published. See *Czechs*, *Czechoslovakia*.

Slovenians or **Slovenes.** The Slavic people who, from the 6th century, have lived in the southern districts of the former Austrian empire, reaching to the Adriatic. Most of them have been included in Yugoslavia. They possess in their language some of the earliest Slavic writings. Their name is a survival of the ancient name for Slavs. It probably means "speaking," or "those who speak," as the ancient Slavs called foreigners "the dumb," that is, those not speaking the Slavic language.

Sumerians. The citizens of the world's first known civilization, dating from before 4000 B.C. In the fertile crescent of the Tigris and Euphrates rivers, ancient Sumeria developed food production, monumental architecture, a central state and religion, and a high degree of skill in the arts and sciences. The first writing and the first use of metals came from the Sumerians.

Syrians. The name is often used as a generic term for all peoples of the eastern Mediterranean. The ancient Syrians were the descendants of the Phoenicians. Mixed with other peoples, they were primarily Mohammedan in faith in the Middle Ages. The modern Syrians are even more mixed in background, having incorporated Roman and Crusader, Arab and Turk, Greek and Egyptian, Frenchman and Kurd. The republic of Syria today is strongly pan-Arab in orientation. The coastal Syrians are noted for their commercial enterprise, though a nomadic, herding life prevails in the interior.

Tatars or **Tartars.** The true Tatars appear to have been a tribe of Mongols who lived in the 9th century along the upper Amur River in Asia. They later formed part of the horde led by Genghis Khan, and the name came to be applied to all Mongols. Their fierceness is said to have given rise to the notion that they came from Tartarus, Latin for hell; hence the familiar name for them, Tartars. See *China*, *Mongols*.

Toltecs. An Indian tribe of Mexico, dominant in central Mexico before the Aztecs from the 9th to the 13th centuries. They are known primarily from archaeological discoveries and no equation to living Indians is regarded as reliable. Their most famous ruins are the constellation of temples and other monumental buildings at Teotihuacan, in the Valley of Mexico. Here the Pyramid of the Sun is the largest human structure yet excavated. See *Mexico*, *Mayans*, *Aztecs*.

Vandals. A people, closely related to the Goths, whose early home was along the southern shore of the Baltic Sea. During the first four Christian centuries, they moved southward and then westward into Gaul. They swept through Spain in the 5th century and established a kingdom in northern Africa, thence invading Italy. They were overthrown in 534 by the troops of Justinian under Belisarius. Later, they were converted from Arianism to the orthodox Catholic faith. Their reputed cruelty and destructive methods in warfare gave us the word vandal.

Vietnamese. The various peoples of North and South Viet-Nam, diverse in language and culture. Annamite and Chinese dialects are prevalent in the north, Vietnamese and French in the south. The people range from the simple Montaignard tribesmen of the interior to the highly educated, French speaking elite of Saigon. The Vietnamese are primarily Buddhist, with a large Roman Catholic minority.

Visigoths. The West Goths, who, at the first approach of the Huns in the Danube valley in the 4th century, were allowed by the Romans to settle in Roman territory south of the Danube. Having learned their power in battle with the Roman legions, they moved westward through Greece to the valley of the Po. In 410 they conquered and plundered the city of Rome, sparing the churches at the command of Alaric, their young leader. After his death in southern Italy, they moved into Gaul and northern Spain, founding a Visigothic kingdom with its capital at Toulouse. Under their king Theodoric, they aided in defeating Attila and the Huns in 451. But the Franks drove them from Gaul in 507. They re-established themselves in Spain, with a capital at Toledo. When the Arabs invaded and seized the greater part of Spain in the 8th century, the Visigoths retired to the mountains and founded the modern states of Spain and Portugal.

Walloons. The modern descendants of the ancient Belgae mentioned by Cæsar, occupying the southern part of Belgium and some districts in France. Their mother tongue is a French dialect. The name Walloons, which means "strangers," was given them by the Dutch, when in 1567 large numbers of the Protestant population fled to Holland. From there, a company of them emigrated to America in 1624, settling on the Hudson near Albany and on the Delaware near Gloucester, N.J. They were the first white people to till the soil of New Netherlands. See *Belgians*, *Belgium*.

Welsh. The Celtic people of Wales. They are the descendants of the Brythonic Celts who occupied Britain when the Anglo-Saxons entered the island. They are most closely related to the Celtic people of Brittany. See *Bretons*, *Wales*.

Zulus. A Bantu people who now occupy a district in the northeast part of Natal, South Africa. They are chiefly herdsmen, but they also raise crops of millet, corn, sweet potatoes, and tobacco. They are of fine physical build and are formidable soldiers. Their dwellings are thatched and plastered huts of beehive form, which they arrange in a circular group, or kraal, with their cattle in the center. At the beginning of the 19th century, they controlled a large part of southeast Africa by means of a splendid military organization. They maintained their independence until 1883–84, when the British annexed their territory.

WORLD WAR I

The immediate occasion of the World War of 1914–18 was the assassination of a Habsburg prince in a remote city of Austria-Hungary, but the real causes lay far deeper, and reached far back into the past. The century-long rivalry of French and Germans, the aspirations of united Germany for a position as a world power, her fear of the pressure of the Russian glacier, ever crowding west and south, the commercial rivalry of Great Britain and Germany, the unrest of the smaller states and of racial minorities,—all had contributed to set up stresses and strains which were sure to fracture the thin crust of international peace when the occasion arose.

There had been other world wars, such as the Seven Years' war of 1756–63, or the Napoleonic wars, but in sheer magnitude the war of 1914–18 dwarfed all that had gone before. In the end it embattled twenty-eight nations, embracing more than nine-tenths of the entire population of the globe.

German Pre-War Policy. Racial rivalry was one of the causes of the war, and in its earliest phase the conflict was a clash of Pan-German and Pan-Slavic aspirations in the region of the Balkans. But the World War was more than a conflict of Teuton and Slav. Germany, united under the house of Hohenzollern and allied to the Habsburg empire of Austria-Hungary, controlled Central Europe. The Germans had gained that position by war, and it was natural that they should think that war was a paying business. Yet, mighty as was Germany's power, the Germans were not content with their position in the world. To spread German "kultur" and German rule became the ardent desire of millions of Germans. Many writers emphasized Germany's need for expansion to furnish an outlet for German population and energies. Not a few openly proclaimed that this expansion must be obtained by conquest. Great efforts even were made to prevent German emigrants to other countries forgetting their loyalty to their Fatherland.

Alliances with other powers were builded to strengthen the German position. The Dual Alliance of 1879 with Austria-Hungary was broadened in 1882 into the Triple Alliance by the inclusion of Italy. Unfortunately Bismarck's policy of a good understanding with Russia was neglected. Much attention was paid to cultivating friendly relations with Turkey, and this policy proved fruitful. Geographical factors counted here. Germany in a general war would be exposed to attack from both east and west. Whether for attack or for defense, she must be ready to strike hard and swiftly in either direction. For this reason the German army must be made—and was made—the strongest in Europe.

French and German Antagonism. It had been a principle of French policy since Louis XIV to keep Germany disunited and helpless; and German particularism and rivalries had helped her opponents. In the Franco-Prussian war of 1870–71 Germany had become united and had inflicted a humiliating defeat on France. Ever since that conflict her people had dreamed of revenge and of regaining their lost provinces of Alsace-Lorraine. The increasing population of Germany and the static population of France was also making Germany increasingly dangerous should she, as some Germans wished, attack France again. France needed allies; hence the Dual Alliance.

Germany and Great Britain. In the last analysis, the rivalry that had developed between these two peoples arose out of the fact that one was already what the other wished to become. The British had entered early into the work of Empire building, and had arrived. The Germans entered the race very late. Having already acquired all that she desired, Great Britain coveted nothing that Germany possessed, but in course of time she came to have an uneasy feeling that Germany was becoming a menace to her position in the world. The development of German industry was cutting into British markets; the increase of her commerce and merchant marine was making her a dangerous rival in world trade. The open declarations of hostility by some Germans tended to deepen British distrust. Worst of all was the increase in the German navy. For Great Britain, control of the sea-routes by her own navy was vital; Germany, Great Britain thought, was under no such necessity. Great Britain increased her navy accordingly.

Fear of Germany had already brought about an important diplomatic revolution. For centuries Great Britain and France had been rivals, but common dread of Germany led, about 1904, to the forming of the *Entente Cordiale* between the two nations. In 1891, as a makeweight against the Triple Alliance, France and Russia had formed the Dual Alliance. Differences between Great Britain and Russia were now composed, for Germany seemed to have become a greater danger to the Empire than Russia, and the *Entente Cordiale* was broadened into the Triple Entente. The Entente powers said their purpose was purely defensive; the Germans called it an "encirclement" and grew restive. These alliances meant a balance of power, and to that extent made for peace; on the other hand they made it inevitable that, if war ever began, all would be drawn in.

The Balkan Problem. In 1909 Austria-Hungary, without consulting the other interested powers, annexed Bosnia and Herzegovina, former Turkish provinces over which she had held a protectorate since 1878. These provinces were largely Serb in population, so Austria-Hungary's action was a blow to the desires of the Serbians for national unity. In 1912 and 1913 came the Balkan wars. The result was a great increase in the territory and strength of Serbia, although the creation of Albania cut her off from the Adriatic. Serbia had the sympathy and support of Russia, who had never lost sight of her old desire to control Constantinople (Istanbul) and the Straits. A general European war was narrowly averted by the efforts of Great Britain and Germany, but Teutonic prestige in the Balkans suffered, and the hostility of Austria-Hungary and Serbia increased.

The Immediate Occasion of the War. On June 28, 1914, Archduke Francis Ferdinand, heir apparent to the Habsburg monarchy, and his morganatic wife, were assassinated while on a visit to Sarajevo, the capital of Bosnia. The murderers were Habsburg subjects of Serbian blood. Later investigations showed that the plot had been formed in Serbia by a powerful Pan-Serbian secret society, the Narodna Odbrana, and included some Serbians, one a member of the Serbian general staff. Count Berchtold, the Austrian premier, thought he saw the opportunity to settle scores with Serbia once and for all. The German government rashly promised to support Austria-Hungary, unfortunately without knowing the details or full extent of Berchtold's plans. On July 28 the Austrian government dispatched to Serbia an ultimatum demanding reparation and suppression of the Pan-Serbian movement in a form which meant Austrian intervention in Serbian domestic affairs. An answer was demanded within forty-eight hours.

From the outset the dangerous possibilities of the situation were apparent in the European chancelleries, and the Great Powers, especially England, were at work to prevent war, or at least to localize it. Germany, whose influence at Vienna was the greatest, was hampered by the "blank check" she had already given, and her efforts to restrain Austria came too late. The Serbian reply conceded almost everything, in form, but it made no difference. Austria-Hungary rejected her answer, broke off diplomatic relations, and on the 28th declared war.

Now the effect of the alliances began to appear. Along with it came the influence of the general staffs in Russia, Germany, and France, none of whom wished to lose the advantage of speedy mobilization. But mobilization meant war. Russian interests could not allow Serbia to be crushed. On July 26 she began premobilization measures; on July 29 she mobilized against Austria-Hungary. Germany could not allow Austria-Hungary to be defeated. On July 31, she demanded that Russia cease her war preparations and peremptorily asked France to state her position. On August 1, Germany declared war against Russia, and France ordered mobilization. On August 3 Germany declared war against France. On August 2 Sir Edward Grey assured France of the assistance of the British fleet in the North Sea and the Channel.

British doubts were resolved by the German invasion of Belgium. German military strategy had long planned, in the event of a war on two fronts, an overwhelming attack upon France before Russia could mobilize. But the Franco-German frontier was strongly protected by nature and art, and military opinion had long foreshadowed a movement through Belgium by one side or the other. Belgium's neutrality had been guaranteed by treaties, but the German government pleaded a "state of necessity." On August 2 they demanded the right to cross Belgium, alleging that France intended to march through the country, and offering guarantees and indemnity. Belgium replied (August 3) that she would defend her neutrality, and King Albert appealed for aid to Great Britain.

On August 4 Sir Edward Grey sent an ultimatum to Berlin demanding that Germany should immediately promise to respect the neutrality of Belgium. The German chancellor Bethman-Hollweg expressed regret that Great Britain should go to war "just for a word . . . just for a scrap of paper," but he refused to give the promise.

Comparison of the Combatants. In area the Entente Powers were very much superior to the Central Powers; in population and wealth about double. On land, Germany had an army of 5,400,000, war strength, splendidly organized; the Russian army was about equal, but poorly organized; the French, somewhat less but on a par with Germany. Austria-Hungary's army of 3,600,000 was much less efficient than Germany's. The armies of the smaller powers were insignificant in comparison. Great Britain's regular army amounted to 137,000 men, besides territorials and colonial forces. The Central Powers possessed an immense military advantage because their position, while it exposed them to attack on two sides, enabled them to fight on interior lines.

The German navy was greatly superior to the combined forces of France and Russia, but Great Britain brought into the conflict the mightiest fleet ever built up to that time. For many years it had been her policy to maintain a navy superior to that which any two powers combined could bring against her. Furthermore the combined fleets of France and Russia were much superior to that of Austria-Hungary, but the Russian fleets were bottled up in the Baltic and Black Sea.

The Invasion of Belgium and France. The best chance for the Central Powers to win was to make the war a short one, getting a decision before the superior naval strength of the Allies and the inevitable blockade could do their work. The German high command, therefore, planned to throw an immense army against France through Belgium and Luxemburg, the latter also a neutral state, and crush her before Russia could be ready. To the Austro-Hungarian forces and to a few German army corps was left the task of holding the eastern front.

The first German troops to enter Belgium crossed the frontier on August 3. Their objective was the city of Liége, whose forts commanded the railway lines that must be used in any invasion of France from the northeast. The German heavy artillery broke the ring of forts, and Liége fell on the 7th. The Germans pushed on to the heart of Belgium. Brussels was captured on the 20th and the main Belgian army moved north to defend Antwerp. Detaching a small force to keep the Belgians in check, the main German army moved south to the French frontier.

The French meanwhile had attempted a generally unsuccessful invasion of Aisace and Lorraine. The strength of the movement through Belgium had been underestimated by General Joffre, the French commander in chief, and the forces along the Belgian border were inadequate, though reinforced by two British army corps under the command of Field Marshall Sir John French. The defenses of Namur were crushed by the German 42-centimeter howitzers, and by the 23d of August the invaders had won control of the passages over the Meuse and Sambre.

The French around Charleroi were forced back. The little British army around Mons held back the German right wing under General von Kluck until the 24th. Then, outnumbered and outflanked, the corps commanders, Generals Haig and Smith-Dorrien, began a stubborn retreat. The Germans pursued with unprecedented rapidity, making use of motor transport.

On August 27 it was announced that the French government had been reconstituted on a war basis. General Galliéni was appointed governor of Paris, and preparations for a siege were hurriedly made. On the 30th a German airplane dropped bombs upon the city. The government was hastily removed to Bordeaux, and a large part of the civil population fled, but French morale continued good.

Meanwhile the French and British armies on the northern front fell back southward, pivoting on the great fortress of Verdun—swinging back upon Paris like a door. On the 17th the German right was within 17 miles of Paris, but, instead of stopping to besiege the city, the Germans turned southeastward after their true objective, the retreating Allied armies.

First Battle of the Marne. The French retreat had been calculated strategy on the part of General Joffre, who was determined to fight the decisive battle on ground of his own choosing. Von Kluck's movement to the southeast (ordered by von Moltke, the commander in chief) had exposed his right flank to an attack from Paris. Urged by Galliéni, Joffre now halted his retreat, and, on September 5, the Allied armies, on a front of 180 miles from Paris to Verdun, turned upon the invaders and began the battle of the Marne. The French efforts were directed to defeating and rolling up the German right wing under von Kluck, which was now over-extended, and had been weakened by the withdrawal of troops for the eastern front; that of the Germans, to breaking through the French center. In defending his exposed flank against Galliéni's attack (at a critical moment, that general commandeered all the taxicabs in Paris to bring out his reserve) von Kluck opened a gap between the First and Second armies. The French broke through, and the Germans were forced to retreat. The battle of the Marne stopped the first German drive, and, as the event proved, decided the war. The German retreat was skillfully conducted, with small losses, and their army now took position behind the river Aisne.

The fighting now moved north. The Germans had already taken Maubeuge; they now attacked Antwerp. The "Big Bertha's" (42-centimeter howitzers) smashed through the defenses, and on October 9 the city surrendered. Their next move was toward Dunkirk and Calais. They were opposed by a mixed force of British and colonial troops, the remains of the Belgian army under King Albert, and French reinforcements, the whole commanded by General Ferdinand Foch. The Allies won this "race to the sea" by a narrow margin. When, after six weeks of desperate fighting the battle died down, they still held a small corner of southwestern Belgium.

The battle in the west now resolved itself into a warfare of trenches, each side holding a front of more than 400 miles from Switzerland to the North Sea. Until almost the end of the war, this condition of stalemate was to continue.

First Battles on the Eastern Fronts. Meanwhile, great events had been taking place on the eastern front. Although the main Teutonic effort had been in the west, the Austro-Hungarians massed about a million men in Galicia and undertook an invasion of Poland from the southwest.

But the Russians managed to mobilize their forces more rapidly than had generally been considered possible. Under the skilled generalship of the Russian commander in chief, the grand duke Nicholas, immense forces were hurled against the Austrians in Galicia, while by way of diversion in favor of hard-pressed France, two armies totaling about 250,000 men undertook an invasion of East Prussia.

For a time the Russians carried all before them. The Germans were defeated at Gumbinnen, and the Russians ravaged the country. To hold the Russians in check, several army corps were hastily detached from the western front and were hurried to meet the Muscovites. This was a serious military blunder, since the presence of these troops on the Marne might have changed the result.

To command the German forces in East Prussia a new general was selected, General Paul von Hindenburg, a veteran of the wars of 1866 and 1870. The new leader had made a careful study of the country which he was now called upon to defend, and he enjoyed the assistance of a capable chief of staff, General von Ludendorff. On August 26 began what is generally known as the battle of Tannenberg. Von Hindenburg's plan was masterly, resembling that of Hannibal at Cannæ. After four days of fighting, the Russians attempted to retreat, but they were hopelessly involved in a labyrinth of lakes and swamps, and their army was almost annihilated.

Meanwhile a vast and complicated conflict was being fought out in southern Poland and Galicia. Here the outnumbered Austro-Hungarians were badly defeated. Lemberg was captured; by September 16 the Russians claimed to have taken 250,000 prisoners, besides immense quantities of supplies and cannon. Siege was laid to Przemysl, and Hungary was in danger.

The blow dealt Austria-Hungary at this time was a staggering one and might have proved fatal had not the Germans rendered aid. Von Hindenburg advanced through Silesia into Poland, while the Austrians moving forward from Krakow succeeded in raising the siege of Przemysl. By a sudden dash the Germans almost captured Warsaw. Again assuming the offensive, the Russians drove von Hindenburg back toward Silesia and the Austrians to Krakow and again laid siege to Przemysl. To effect a diversion in behalf of their western allies, the Russians also attempted a new invasion of East Prussia. In November another German attempt to take Warsaw failed, and another attempt to relieve Przemysl was foiled. In February 1915 von Hindenburg concentrated about 200,000 men in East Prussia and fell like a thunderbolt upon the inferior Russian army. In this conflict, known as the battle of the Masurian Lakes, the Russians were almost annihilated and suffered losses almost equal to those at Tannenberg. He followed up this victory by an invasion of Poland from the north, but after bitter fighting was repulsed.

Meanwhile the Russians had continued to besiege the great fortress camp of Przemysl in Galicia. Repeated Austrian efforts to relieve the fortress were foiled. On March 22 the fortress surrendered. The prisoners taken numbered over 119,000, the greatest number that had ever surrendered at one time in warfare. The grand duke Nicholas followed up this great victory by a drive designed to capture the passes of the Carpathians.

On the Seas. As was generally expected by naval experts, the control of the high seas was immediately seized by the Entente Allies. German and Austrian merchant ships either sought safety in home ports or in those of neutral powers or were captured by the enemy. In the Mediterranean the Austrian navy took refuge in home ports on the Adriatic, while the German protected cruiser *Breslau* and the giant battle cruiser *Goeben* managed to evade French and British pursuers and steamed up the Dardanelles and through the Sea of Marmora to Istanbul, where they played an important part in bringing Turkey into the war on the Teutonic side.

Just before the war began, the main British battle fleet had assembled at Spithead for maneuvers. The admiralty had held them there and had them ready at the critical moment. The German fleet retired behind the fortified island of Helgoland, and there, protected by mine fields and heavy guns of their land forts, they were safe from attack.

At the outbreak of the war, German naval vessels scattered in various parts of the world at once began to prey upon Allied commerce. The most famous of these, the *Emden*, in three months captured over a score of merchant ships. On November 9, 1914, while attempting to destroy a wireless station on one of the Cocos islands, she was destroyed by a much more powerful Australian cruiser, the *Sydney*.

The largest German fleet outside of European waters was the Pacific squadron, commanded by Admiral von Spee. It consisted of the armored cruisers *Scharnhorst* and *Gneisenau*, the light cruisers *Dresden*, *Nürnberg*, and *Leipzig*, and an armed liner. After destroying a number of allied vessels, they met, off Coronel, Chile, on November 1, a British squadron of two armored cruisers and two lighter ships. The British commander, Vice Admiral Sir Christopher Cradock, decided to give battle. The two British cruisers, the *Good Hope* and *Monmouth*, were sunk; the other two vessels escaped in the darkness. The British admiralty hurriedly sent a powerful British squadron southward, under the command of Vice Admiral Sturdee. This squadron, two battle cruisers, two armored cruisers, and some lighter cruisers, met the German squadron off Port Stanley, in the Falkland islands. Only the *Dresden* escaped; she was destroyed later in neutral waters near the island of Juan Fernandez.

Events in the North Sea. The British grand fleet was based on Scapa Flow, in the Orkneys; the German, as has been said, on Helgoland. Each wisely refused to attack the other in its fortified base. It was the British policy to keep the German fleet off the high seas, meantime preserving their own fleet for the defense of Great Britain; it was the German policy to whittle down the superior British fleet, if possible, by floating mines, Zeppelins, and U-boat attacks until they could risk a fleet action.

This policy of attrition at first had some success. The Germans sowed floating mines, illegal by international law, but later the Allies adopted the same practice. One British dreadnaught, the *Audacious*, (October 27, 1914), some smaller warcraft, and many merchant vessels were sunk in this way. The Zeppelins were practically useless. But the submarines were more effective. Their greatest success was on September 22, 1914, when three British cruisers, the *Aboukir*, *Cressy*, and *Hogue*, were sunk by one submarine, the *U-29*, commanded by Captain Lieutenant Otto Weddingen.

The first important naval battle of the war took place on August 28, 1914, in Helgoland Bight, the German losses amounting to three light cruisers and a destroyer.

In November and December the Germans raided the English coast without material results. In January a German raiding squadron met a superior British force and lost the armored cruiser *Blücher*. It soon became evident that the policy of whittling down would not succeed. British dockyards were building ships faster than the Germans could sink them.

The Allied Blockade. Meantime the Allies sought to make use of their sea power to cut off the communications of the Central Powers with the rest of the world. The right of blockade was well established under international law, provided a real and not a "paper" blockade was maintained. But with their own ports closed the Central Powers were still able to carry on trade with Switzerland, Holland, and Denmark, and with Norway and Sweden across the Baltic. The quantity of goods directly obtainable in this way was comparatively small, but an effort quickly developed to use the neighboring neutral states for transshipment from other countries.

At first the Entente powers did not attempt to exclude all goods, but limited their efforts to certain "contraband" articles of distinctly warlike nature. Early in the war, however, they began to extend the list of contraband articles, and to seize them even when consigned to a neutral port. International law on this point was not so clear, but they could cite the practice of the United States during the Civil War.

Food, by international law, was only "conditionally" contraband, that is, if destined for the armed forces. With that excuse a German raider sank an American sailing ship, the *William P. Frye*, carrying a cargo of grain consigned "to order" at British ports which were fortified naval bases. Late in January 1915, the German government took all supplies of grain and flour under government control and established a rationing system. This gave their enemies a pretext for declaring all food contraband.

On October 2, 1914, Great Britain announced that she would lay mines in designated areas in the North Sea. A month later she declared the whole sea a military area, and warned neutral vessels against entering it without stopping at a British port for sailing directions.

On February 4, the German Government announced that, by way of retaliation against the English policy, all waters around the British Isles would be treated as within the "zone of war," and that "all enemy merchant vessels encountered in these waters will be destroyed, even if it will not always be possible to save their crews and passengers."

Neutrals protested against this decree, but the Germans persisted in their course, and sank several vessels, including the *Lusitania*. An extended controversy followed, and Germany for a while modified her policy, but without yielding on the principle.

On March 11, 1915, by way of retaliation for the German submarine decree, the British government issued an order in council establishing a virtual blockage of Germany, though the word "blockade" was not used. Thenceforth all goods of every kind were to be kept out of Germany, and neutral goods destined for Germany, if not contraband, were, when seized, to be purchased by the captors instead of confiscated. All German goods, wherever found, were to be confiscated.

Their control of the high seas enabled the Allies, to conquer the German colonies. Japan declared war on Germany on August 23, 1914, and a Japanese expedition, aided by a small British contingent landed in Shantung and captured the German fortress of Tsing-Tao (November 7, 1914). Japanese warships also captured the Caroline Islands and other German possessions in that region, while Australasian forces took German Samoa, New Guinea, and other islands in that part of the world. In Africa the French and British speedily overran Togoland and, by February 1916, completed the conquest of Kamerun. In South Africa dissatisfied Boers attempted a revolt against British rule but were soon put down. An expedition from South Africa, led by Premier Botha, with General Jan C. Smuts as second in command, invaded German Southwest Africa and conquered it. In German East Africa more resistance was encountered, and a small German force managed to hold out until the end of the war.

Turkey Enters the War. As a part of the "Drang nach Osten," the eastward movement exemplified by the Baghdad railway, German diplomatic influence had been steadily increasing at Istanbul. The German cruisers *Breslau* and *Goeben* had been allowed to take refuge there under the special permission required by the treaties of 1856 and 1879. Instead of expelling or interning them the Turkish government "purchased" them, against the protest of the Entente powers. The German officers and crew continued to man the ships. Many of the Turks and some members of the cabinet desired to remain neutral, but they were overborne by the pro-German party, headed by Enver Pasha, the minister of war. When, in October, the *Breslau* and *Goeben* raided the Russian ports on the Black Sea, the Entente powers announced a state of war with Turkey. Five months later, Great Britain and France agreed to Russian control of Istanbul and the straits at the end of the war.

Warfare with Russia in the Transcaucasus region began immediately and continued with varying fortunes. Early in February 1915 a Turkish attack on the Suez canal was defeated but the canal continued to be in some danger for two years longer.

The Gallipoli Campaign. The importance of opening the Dardanelles and Bosporus and reestablishing communication with southern Russia was obvious to good strategists everywhere, but the Allies delayed fatally. They blockaded the Dardanelles, but Earl Kitchener, with his eyes on the western front, underestimated the importance of sending the necessary land forces. The navy destroyed the forts at the mouth of the Dardanelles on February 19, but an attack on the main defenses at the Narrows, a month later, cost the British three ships.

At last the Allies decided to send a land force, after further delays had given the Turks and Germans time to strengthen their defenses. Hoped-for aid from Russia and Greece was prevented by the German drive against Russia and the refusal of the pro-German King Constantine to bring Greece into the war. Not until April 25 was the first landing attempted, and then the 45,000 troops used, mostly "Anzacs" (Australian-New Zealand Army Corps) could do little more than seize and hold positions near the tip of Gallipoli peninsula. When in May a German submarine sank two battleships, the navy became of less assistance. After further delays more troops were sent, but no important gains resulted. For many weeks the troops held on, suffering from disease and the enemy fire. A last effort in August, after heavy reinforcements had arrived, failed to reach the key positions. A new landing at Suvla Bay resulted only in immense losses, with no material gains.

The Allies held their positions for months longer, until the conquest of Serbia and the entrance of Bulgaria on the German side, gave the Central Powers a clear road to Istanbul and no hope of opening the straits remained. At the end of 1915 the Allied positions were abandoned. This campaign cost the Allies more than 230,000 men.

Italy Declares War. Italy had refused to join her partners in the Triple Alliance in 1914, alleging that Germany and Austria-Hungary were the aggressors. The old hatred of Austria still persisted and with it the desire to "redeem" the Italian-speaking regions of the Dual Monarchy. Both sides bid for Italian support, and the Allies bid higher. In April the secret Treaty of London with the Entente powers promised to Italy the Trentino, Trieste, South Tyrol, and other territory and concessions, and the next month Italy declared war. Italy brought to the Entente a navy more powerful than Austria's and an army of 1,200,000 trained men with considerable reserves. In their attack upon Austria the mountainous character of the frontier country was against them. Their main movement against Trieste was checked at the Isonzo river, and they

made no great progress in the next two years.

The Great Drive against Russia. In the campaign of 1915, the Teutonic leaders, accepting the defensive in the west, launched a great offensive in the east, designed to free Austrian Galicia, to conquer Russian Poland, to destroy the Russian army, and thus to eliminate Russia from the war.

On May 2 General von Mackensen broke through the Russian lines on the Dunajec river in Galicia. Far inferior in artillery, the Russians were unable to check him. In a few weeks von Mackensen retook Przemysl and Lemberg and practically all of Austrian Galicia, together with immense quantities of booty and hundreds of thousands of prisoners.

Meanwhile, in the north, von Hindenburg had taken Libau and had overrun a large part of Courland. Poland was now like a nut in the grasp of a giant nutcracker. Russians were aided by great fortresses such as Ossowetz, Novo Georgievsk, and Ivangorod; but they were handicapped by their lack of artillery, shells, and other munitions. The war had already shown that infantry, no matter how brave, was practically helpless against an enemy that enjoyed a great superiority in artillery. After suffering enormous losses, Grand Duke Nicholas, in order to save his whole army from capture, was forced to evacuate Poland. Warsaw was occupied by the victors on August 5, and the fortress of Novo Georgievsk fell on August 20. After an unsuccessful attempt to make a stand on a line running through Brest-Litovsk, Osowiec, and Kovno, the great retreat had to continue. Grand Duke Nicholas was transferred to the Caucasus, where he was successful against the Turks, and the czar himself assumed nominal command, the real direction, however, being exercised by General Alexieff. The Teutons took Vilna, but their efforts to capture Dvinsk and Riga were foiled by stiffening Russian resistance. The Russians even launched an offensive in Galicia and checked the Germans in that quarter.

The Conquest of Serbia and Montenegro. The Teutonic victories over Russia made a profound impression, particularly in the Near East. In October 1915 Bulgaria threw in her lot with the Central Powers and attacked Serbia from the rear. Greece remained neutral. A strong army under General von Mackensen invaded Serbia from the north, recaptured Belgrade, and drove the Serbians southward. The allies of Serbia procrastinated as usual, and, too late, landed an army at Saloniki. Late in October the Bulgarian and Teutonic armies joined hands in eastern Serbia, and both Serbia and Montenegro were speedily conquered.

Through the conquest of Serbia the Teutons opened a way by which to aid hard-pressed Turkey, and trains loaded with munitions were soon running to Istanbul. With Istanbul under their control, the Teutons hoped to break through to Suez and the Persian Gulf, but that hope was never realized.

On the western front the deadlock that had begun after the repulse of the Germans in Flanders continued throughout 1915. In the second week of March, an attack on Neuve Chapelle, preceded by a heavy bombardment, in which more shells were fired than in the whole of the Boer war, resulted in slight success, and the loss of almost 13,000 men.

Poison Gas and Air Warfare. In an offensive against the British lines near Ypres, April 22, 1915, the Germans for the first time made use of poison gas. It had a momentary success, but the Germans failed to make the most of their advantage, partly by not fully understanding how much the gas had done, partly because of the gallant resistance of a Canadian division. The use of poison gas was denounced as illegal, but the Allies soon adopted it; improvements in technique were made by both sides, and it became an accepted feature of the war.

Aerial warfare also began. The German Zeppelins, or dirigible balloons, made raids on the English coast towns and finally, on the last night of May, reached London and dropped nearly a hundred incendiary bombs. The Germans claimed substantial damage to military objectives from these raids; the British said that only civilian lives and property suffered.

The use of airplanes expanded with astounding rapidity. New types were developed. Within a few months there were fighting planes, bombing planes, observation planes, —a type for each kind of work. By far the most important use to which planes were put was observation, spying out the enemy's movements and directing artillery fire. Later the planes were armed, and real battles were fought in mid-air.

The Deadlock on the Western Front. During the greater part of the campaign of 1915 the French and British attempted no great offensives but confined their efforts to what Marshal Joffre called "nibbling." In April the French failed at the St. Mihiel salient, south of Verdun. In May they had more success at "The Labyrinth," near Arras, but the method was costly out of proportion to results. One reason for this comparative inaction was the scarcity of munitions, particularly high explosive shells. The new technique of intensive artillery preparation before an attack, introduced by the Germans, entailed an expenditure of ammunition undreamed of in the past and not fully appreciated by the Germans themselves, much less by their opponents.

Late in September the British and French began the most serious offensive they had yet undertaken. They attacked a sector in Champagne, a second in Artois, and a third near Ypres after a fierce cannonade, or "drum fire," in places continued for 72 hours. Gas was also used. On the morning of September 25 the Allies delivered assaults in great force in each sector, and for days a bloody confusion of attack and counter-attack followed. Ultimately a little ground was gained but the main German lines held. The total German losses were estimated by the French at 120,000; the Allied losses probably exceeded those of the Germans.

The Drive against Verdun. At the beginning of the campaign of 1916 the Germans again turned their main attention to the western front. With the purpose of "bleeding France white," by drawing the French reserves to one point and destroying them, they launched late in February a tremendous offensive against the great armed camp of Verdun. Their first attacks made substantial gains, but General Joffre and his advisers decided to hold the place at any cost, partly because to lose it would have a depressing effect upon Allied morale.

For months thereafter the bitter battle continued. Hundreds of thousands fell on each side; week after week the Germans forged slowly forward against the bitterest resistance of the French, whose watchword was "They shall not pass." Early in July, the Germans got within a thousand yards of Fort Souville, the key to the French position, only three miles from Verdun. But the British advance on the Somme forced them to withdraw many troops and the fighting gradually diminished. In the following October and December, General Nivelle recaptured almost all the ground that had been lost.

The Battle of Jutland. On the last day of May the main fleets of Great Britain and Germany at last met in battle. On that day, both fleets were in the North Sea to the west of Jutland, neither knowing of the other. Shortly after two o'clock the advance squadron of the German fleet under Vice Admiral von Hipper met a heavier British squadron under Admiral Beatty, and turned back to the main fleet, sixty miles to the south. Beatty pursued, signalling to his main body, seventy miles to the north. In the running fight which followed, the British lost two battle cruisers, the *Indefatigable* and *Queen Mary*. On sighting the German fleet, Beatty turned back north to draw the Germans into conflict with the grand fleet under Admiral Jellicoe, which was hastening to his support. The Germans lost a battle

cruiser, the *Luetzow*, in the pursuit. About 6 P. M. the main British fleet came up. Another British battle cruiser was sunk in the first clash but von Scheer saw he was outmatched. By skillful maneuvering he mystified the British admiral and, before the enemy could close in upon him, escaped in the darkness.

Both sides claimed the victory. The Germans had inflicted heavier losses on a superior fleet, six British capital ships against two of their own,—but the British could better afford it. On the other hand, the British retained command of the sea, and the Germans never ventured another battle.

Only seven days after the battle of Jutland, the British armored cruiser *Hampshire*, which was carrying Secretary of War Kitchener to Russia, struck a German mine off the coast of one of the Orkney islands, and all on board except eleven men perished. Kitchener's tragic death created a great impression.

The Italian and Russian Fronts in 1916. In the middle of May 1916, the Austro-Hungarians launched in the Trentino a great offensive which they hoped would result in their breaking through into the Lombard plain, Milan, and taking Venice and enveloping of the Italian main army along the Isonzo front. Their first attack, on May 15, was very successful and was so competently followed up that by the end of May they had taken two or three hundred cannon and over 30,000 prisoners, and the whole Italian army was in peril.

Once more, however, the Russians made an effective diversion in favor of their hard-pressed western allies. Under the leadership of General Brussilov, the Russians on June 2 attacked along the southern half of the eastern front. They broke Austrian lines and took the great fortress of Lutzk and Dubno. The whole Austrian line in the east crumbled, Bukowina was overrun, and 100,000 prisoners were captured. The Dual Monarchy had to suspend its drive against Italy and withdraw troops from that front to meet the victorious Muscovites. Germany also had to slacken her own offensive against Verdun. The Russians were held in check before Lemberg and Kovel after enormous losses on both sides.

Thanks to this opportune Russian diversion, the Italians were able to regain most of the ground they had lost. Early in August they captured Gorizia, but there their success ended, and the virtual deadlock along the Isonzo continued.

The Battle of the Somme. The British army in France had now grown to over seventy divisions, well-trained, fully equipped, and organized. Under the command of General Sir Douglas Haig, it was now ready for an offensive movement. On June 24 the British artillery began a terrific bombardment of the German lines and continued it until the morning of July 1, when British and French infantry attacked on a front of over twenty miles in the region of the Somme river. The British objective was Bapaume; the French, Peronne. Both were successful in taking the first lines, but resistance stiffened as they advanced. On the first day of the attack the British lost 60,000 men, and advanced half a mile.

To pound unceasingly was the Allied policy; the Germans brought up thousands of reserves for resistance and counterattack. Aloft, the opposing aircraft fought for the control of the air, a necessity in so flat a country for directing artillery fire. The surface for miles was transformed into a barren wilderness of shell craters. In an attack on September 15 the British for the first time made use of "tanks,"—armored cars mounted on caterpillar tractors. The smaller tanks were armed only with machine guns; the larger ones, with small pieces of artillery also. The tanks proved able to move through barbed wire entanglements, to cross trenches, to push down walls and even trees, and were especially helpful in destroying machine gun "nests." They proved, on the whole, successful, and assumed greater and greater importance as the war progressed.

Late in November the coming of wet, wintry weather brought the battle to a close. The Allies had gained something less than seven miles on a twelve mile front; they had not gained the break-through for which they had hoped. This gain had cost the British 420,000 men; the French, nearly 200,000. The German loss may have been as great.

The Defeat of Rumania. Meanwhile Rumania had entered the war on the side of the Entente. She was promised the Banat, Transylvania, and other territory, in much of which the population was largely Rumanian. On August 28, 1916, she declared war on Austria-Hungary, and hostilities with the other Central Powers soon followed. After some initial Rumanian successes, the armies of the Central Powers, led by Generals von Mackensen and von Falkenhayn, attacked Rumania from the north, west, and south, captured the capital, and overran two-thirds of the country, while an Allied force remained immovable at Saloniki. Russian reinforcements finally checked the invaders, at a line running along the lower Sereth river, and thence northeastward to the Carpathians.

The Rumanian fiasco created much dissatisfaction in Allied countries, and was instrumental in bringing about cabinet changes in both France and Great Britain. In the latter country the Liberal cabinet under Asquith had declared the war. The Conservatives had supported them, but early in 1915 had demanded a share in power as well as in responsibility, and a coalition cabinet had been formed. Now the feeling grew that Asquith was too careful of the rights of the citizen and lacked the energy necessary for a war premier. He retired and was succeeded by David Lloyd George. In France similar conditions brought about, after some friction, the appointment of "the Tiger," Georges Clemenceau, as a premier in November 1917. In the field Joffre retired at the end of the year; he was succeeded by General Nivelle, the defender of Verdun.

Peace Discussions. Toward the end of 1916 proposals for peace came forward from two quarters. On December 12 the German government announced its willingness to enter into peace negotiations. On December 18, President Wilson, in a note framed before the German proposal appeared, asked the belligerents to state the terms on which peace might be concluded. The replies to both propositions showed that no agreement was yet possible. On January 22, President Wilson explained his position to the Senate, saying that there must be a "peace without victory," since "only a peace between equals can last"; and favoring a League of Peace to secure the fulfillment of such a treaty.

The United States Enters the War. In the United States, especially in the northeast, popular sympathy had been generally with the Allies from the beginning. German policies toward the United States, even before the war, had been irritating; the old feeling against England was weakening; and France had been our traditional ally. At the outset of the war President Wilson, following our accepted policy, had issued a neutrality proclamation and had repeatedly protested against both British and German violations of international law. American feeling, however, especially in the West and Middle West, was against any participation in a European war, and Wilson was re-elected in 1916 under the campaign cry, "He kept us out of war."

The submarines brought matters to a crisis. Wilson had protested against the German war zone of February 1915. After the sinking of the *Lusitania* and later the *Sussex*, with the loss of American lives, his position held such prospects of vigorous action that, in May 1916, the German government agreed not to sink merchant vessels without warning, provided the United States held Great Britain also to "strict accountability." On January 31, 1917, the German high command suddenly announced that it would resume unrestricted submarine warfare

against any merchant ships found in "barred zones" around the British Isles, along the Atlantic coast of France, and in the Mediterranean. The United States was permitted, under certain restrictions, to send one ship a week to Falmouth in southern England. President Wilson's answer was the breaking off of diplomatic relations with Germany, on February 3.

The unrestricted submarine warfare continued. On February 26, President Wilson announced that he deemed it desirable for the United States to adopt an attitude of "armed neutrality," and asked for authority to arm American merchant ships. This was obviously a step toward war. The same day word reached Washington of the loss of three Americans on the British ship *Laconia*. A few days later an intercepted dispatch was published which showed that Zimmerman, the German foreign minister, was seeking to stir up Mexico and Japan against the United States in the event of war with Germany. A bill empowering the president to arm merchantmen, and making appropriations for that purpose, passed the House by 403 to 13, but Senator La Follette and other opponents of war defeated it by a filibuster in the Senate. The president then found authority, under an act of 1797, for placing naval guns and crews on merchant ships. Congress was called to meet in special session on April 16, a date later advanced to April 2.

Meantime the submarines had been working great havoc. In February the Germans claimed the sinking of 781,000 tons of shipping; the British admitted 490,000. The peak was reached in April, with the loss of nearly a million tons. Then, with the adoption of the convoy system, due largely to Lloyd George, the Allies began to get the upper hand. American ships were among those lost.

On April 2, President Wilson appeared before Congress and delivered a war message. He stated that the recent course of the German government constituted a "warfare against mankind." Armed neutrality had proved ineffectual, and he asked Congress to recognize that war had been thrust upon the United States by the acts of the German government. He requested the necessary steps to force the German government to terms and end the conflict. Resolutions to that effect passed the Senate on the night of the 4-5th of April by a vote of 82 to 6 and the House on the early morning of the 6th by a vote of 373 to 50. The same day, the president signed the resolutions, and America and Germany were formally at war.

Relations with Austria-Hungary had long been strained, and in September 1915 the United States had demanded and secured the recall of Constantine Dumba, the Austro-Hungarian ambassador, for attempting to stir up strikes in American munition factories. Diplomatic relations were severed by the dual monarchy on April 8, but war was not formally declared until the 7th of the following December, the declaration being made by the United States. Turkey severed relations on April 17, but a state of war was never declared. Diplomatic relations between the United States and Bulgaria were continued throughout the conflict.

American Preparations. America's entry into the conflict greatly heartened the Entente Powers. Furthermore, it encouraged several other nations, such as China, Brazil, Panama, Cuba, and Bolivia, to break relations with Germany or to declare war against her.

Within less than three weeks after the declaration of war Congress appropriated seven billion dollars for war purposes. Subsequently other immense appropriations were made. A policy of advancing loans to our Allies was at once adopted, and by the close of hostilities about eight billion dollars had been so advanced. In May, Congress passed and the president signed a Selective Service bill, and under this and subsequent extensions all male persons not alien enemies, between the ages of 21 and 45, were required to register. After exemptions, about 3,000,000 soldiers and sailors were obtained. Some hundreds of thousands, also, volunteered.

To obtain money with which to conduct the war, Congress enacted special tax legislation and authorized the issuance of certificates of indebtedness, war savings certificates, better known as thrift stamps, and government bonds. By far the largest sum was realized from the sale of bonds, of which five great issues were floated, the first on May 14, 1917. The four liberty loans aggregated $14,000,000,000, at rates varying from 3½ to 4¼ per cent. A fifth, called the victory loan, for $4,500,000,000, was floated soon after the armistice. All were oversubscribed.

The country now had to prepare for war. Between April 5, 1917, and June 30, 1919, 35 billion dollars were expended, which was several billions more than had been spent for all purposes from the beginning of the Revolution down to 1917. Of this sum, however, nine billions were advanced to our allies in the conflict.

Work of the American Navy. Shortly before the United States entered the war, Vice Admiral William S. Sims was sent to England to arrange cooperation of American naval forces with those of the Allies. On his arrival in London he found the British much depressed over the submarine situation. The American navy took over the work of patrolling a large part of the Atlantic, thus freeing British ships for use in home waters, and from May on destroyers and other craft were sent abroad. In December 1917 a squadron of four dreadnoughts (a fifth was later added) was sent over under command of Rear Admiral Hugh Rodman and joined the British Grand Fleet. Two other battleships in the early summer of 1918 began operations from a base in Ireland. An immense amount of work was done in convoying ships across the Atlantic and through the war zone.

The greatest loss suffered by the American navy during the war was the sinking of the armored cruiser *San Diego*, which struck (July 1918) a German mine laid by a submarine off Long Island. One destroyer, the *Jacob Jones*, was sunk (December 6, 1917) by a submarine in European waters. Other destroyers and smaller vessels were sunk or damaged, and a large number of armed merchant vessels and transports were lost. In return we captured one submarine and probably sank others.

American Troops sent to France. The American regular army, on April 1, 1917, numbered only 128,000 men. The French government, however, urged that at least a few American troops should be sent to France as speedily as possible, for the sake of the effect on Allied morale. To command the overseas force the president selected Major General John J. Pershing. General Pershing and his staff sailed from New York late in May. Late in June the first contingent of troops landed at St. Nazaire, whence they were transferred to training bases in Lorraine.

The Western Front in 1917. During the first two months of 1917 the French and British made preparations for a grand offensive. General von Hindenburg who in the previous summer had succeeded von Falkenhayn, forestalled them by withdrawing to a shorter and stronger zone of defense, the Hindenburg line, laying waste the country behind him. Although the conditions had changed, the offensive was not given up. On April 9 the English launched a great attack about Lens and Arras. Canadian troops carried the important Vimy Ridge, and more gains were made at less cost than in the battle of the Somme; but the German lines still held. On April 16, the French, under Nivelle, attacked in front of Reims. They gained some initial successes, but their losses were severe, even resulting in mutinies among the French troops. General Nivelle was succeeded by General Pétain, with General Foch as his chief of staff.

Again in June the British launched another attack in Flanders. They took Messines Ridge, after the explosion of a gigantic mine, and bitter fighting continued through the summer. In the fall British operations in the low ground about Passchendaele literally bogged down in the swampy terrain, though a part of Passchendaele Ridge was taken. The French meanwhile had recovered sufficiently to make another drive with some success, near Soissons, and drove the Germans from the Chemin des Dames.

The Russian Revolution. Unintelligent despotism, universal corruption, and radical intrigue were doing their work in Russia. In March a revolution broke out, which resulted in the deposition of the czar and the establishment of a republic. Moderate revolutionists who favored continuing the war at first managed to control, but the Soviets, or councils of workmen's and soldier's delegates, who desired more radical measures and a speedy peace, constantly increased in power. German secret agents took advantage of the situation. The republican government, headed by Kerensky, inspired the army to a last effort. In July an offensive was launched in Galicia; successful at first, it turned into a disgraceful rout. The Germans occupied Riga and Odessa. For a time Kerensky held power as a virtual dictator, but in November the radical revolutionists, or Bolsheviki, under Lenin and Trotzky, seized control. They not only carried through a complete economic and social revolution but, on December 15, 1917, signed an armistice, and, in the following March, the humiliating treaty of Brest-Litovsk.

The breakdown of Russia enabled the Germans, even in 1917, to concentrate most of their forces on the Western front. Large forces of men and guns were transferred to Flanders to hold the British in check and a grand drive was prepared against Italy.

The Italian Disaster. During the spring, summer, and early fall the Italians had continued to make slow progress on the Isonzo. On October 24 the Austro-Hungarians and some German divisions launched a sudden offensive. German shock troops broke through the Italian lines in the region of Caporetto and drove them westward in disastrous rout. Venice and Milan were in grave danger; the whole of the Lombard plain was threatened. General Diaz, who succeeded General Cadorna, rallied the Italians behind the Piave river, and the arrival of French and British reinforcements helped to save the situation. A German attack from the Trentino, to turn the Piave line, was finally checked.

The Italian defeat had, however, been a major disaster; northeastern Italy was overrun; and the enemy had taken a quarter of a million prisoners, about 2500 guns, and vast stores of munitions. The Italian situation continued to be grave until near the end of the war.

Partly to prevent the Germans from sending any more troops against the Italians, the British Third Army under General Byng, on November 20, launched a sudden attack on the German lines in front of Cambrai. A great number of tanks were used to break through the barbed wire entanglements and destroy machine gun nests. The British got within three miles of Cambrai, but had not sufficient reserves with which to follow up the success. On November 30 the Germans restored their lines by a powerful counterattack and recovered about a third of the ground lost. The main importance of the battle was that it demonstrated the possibilities of tanks.

Campaign in Mesopotamia (Iraq) and Palestine. The Allied hope of victory in 1917 had not been realized. In some important fields of action their arms had met with disaster, and only in Iraq and Palestine could they point to really notable successes. Late in 1914 an expedition, composed mainly of troops from India, had landed at the head of the Persian gulf, and managed to fight its way in November 1915 almost to Baghdad. At Ctesiphon, however, it met superior forces and had to retreat down the Tigris river to Kut-el-Amara, where, despite the efforts of a relieving army, it was forced to surrender (April 29, 1916). In the following December the relieving army, commanded by General Maude and increased to over a hundred thousand men, again assumed the offensive in Iraq, recaptured Kut-el-Amara, and after decisive victories entered the city of Baghdad, March 11, 1917.

Meanwhile the British had encouraged the Arabs in Arabia to revolt against the Turks. Thomas Edward Lawrence, a young British archeologist, organized and led the Arab tribes. Utilizing their methods of desert warfare, he made them an invaluable auxiliary force.

In March 1917 a British army pushing northward from the Isthmus of Suez defeated a Turkish force near the ancient city of Gaza. In October General Sir Edmund Allenby took command and began an active campaign, and in December, for the first time since the Crusades, the flag of a Christian nation floated over Jerusalem.

In Greece, also, affairs had taken a turn more favorable to the Allies. Former Premier Venizelos and Admiral Condouriotis began a revolutionary movement in Crete and established a provisional government, which won over other islands and most of the Greek fleet, and entered the war on the side of the Entente. In June 1917, the Allies compelled King Constantine to resign in favor of his second son, Prince Alexander. Venizelos became premier, and Greece was brought into the war.

The Great German Offensive of 1918. During the winter of 1917-18 both Teutonic and Allied leaders made pronouncements with regard to peace, but their views as to terms differed so widely that it was clear that the war must go on. Meanwhile the Germans made preparations to launch a stupendous blow which they hoped would bring them victory before America could take a real part in the war. With forces released by the collapse of Russia, they were now equal to the Allies on the Western front. The place selected for the offensive was in the region between Arras and La Fere, at the point of junction of the French and British lines. At five o'clock on the morning of March 21 the Germans began a terrific bombardment on a front of about sixty miles.

After four hours the infantry moved forward to the attack. The British, outnumbered five to one at the point of attack, were unable to withstand the blow. The Fifth British Army was practically cut to pieces. In a few days the Germans had regained practically all the territory they had lost. At one time it seemed probable that the Germans would be able to separate the British from the French and to defeat each in detail. France was in greater danger than at any time since the battle of the Marne. Paris was subjected to repeated air raids and was bombarded by super-guns concealed in the forest of St. Gobain at the unheard-of distance of 74 miles.

But the British Third Army under Byng held like a wall before Arras, containing the flood on the north, while hastily gathered French forces, after bloody fighting, dammed it on the south. The French and British joined hands once more, and the Germans, worn out by their gigantic efforts, failed to reach the vitally important town of Amiens.

On April 9, Ludendorff and Hindenburg delivered another great blow against the British lines in Flanders. The Germans broke through a portion of the line held by a Portuguese division, took the Passchendaele and Messines ridges, Armentieres, and Kemmel Hill, and threatened Ypres. There was grave danger that the whole British army might be hurled back in irretrievable disaster upon the Channel, but British fighting qualities and French reenforcements once more brought the assailants to a pause.

Foch Becomes Commander in Chief. From the Allied point of view the German offensive had been productive of at least one good result. Hitherto

in the war their activities had been greatly hampered by lack of united command. A Supreme War Council had been created. But this was not enough. On March 27, in the midst of the first German offensive, British and French representatives met and gave the supreme command to Ferdinand Foch. On the next day General Pershing tendered his forces to Foch, and ultimately the great Frenchman became generalissimo of all the Allied armies on all fronts.

At the time Pershing made his tender there were less than 370,000 American troops in Europe, of whom about half were noncombatants. American participation in the fighting had been almost wholly confined to meeting petty German raids. The First Division was now sent to the active front near Montdidier, and, at the urgent request of the French and British leaders, great efforts were concentrated upon bringing more American troops over. During the war only 396 American soldiers were lost as a result of submarine activities.

The Final German Efforts. On May 27 the Germans launched a new offensive on a thirty-mile front between Reims and Soissons. The Allies were taken by surprise, and with comparatively slight losses the Teutons recaptured the Chemin des Dames Ridge and drove a deep salient to the river Marne, taking great numbers of prisoners and guns.

On the day after the Germans launched this offensive, the American First Division under Major General Bullard captured the town of Cantigny near the apex of the Amiens salient. This was the first considerable operation in which American troops were engaged, but the Second and Third divisions were now sent to the Marne front in the Chateau-Thierry region and helped to bring the German drive to a pause. In fighting for Belleau Wood a brigade of marines won great distinction. Meanwhile, French troops in the region of Compiegne had defeated with great slaughter a German effort to connect the Marne salient with that driven toward Amiens.

By July 1 the Germans claimed to have captured, since the launching of their March offensive, 191,454 unwounded prisoners and over 2000 cannon, but they had failed to obtain the decisive victory they had hoped to win. Owing to the rapid arrival of American troops, the "rifle strength" of the Allies on the western front had passed that of the Germans.

The scene of the last German attack was the Reims salient, on a great front from Chateau-Thierry almost to the Argonne Forest. But the Allied leaders divined the German plan and concentrated great numbers of troops and guns to meet it. When the attack came on the morning of July 15, the Allies, by using a "yielding defense," stopped the German drive in most places after inflicting great losses. Some German divisions forced their way over the river Marne, but on the sector held by the American Third and Twenty-eighth divisions determined counter-attacks speedily hurled the assailants back across the river. By the end of the third day of battle it was evident that the drive was doomed to failure.

The Allies Assume the Offensive. The time had come for which Foch had long been waiting. At dawn of the 18th he attacked the western side of the Marne salient. The American First and Second divisions participated in the initial attack, and others were soon thrown into the fight. There was no preliminary artillery preparation, but the troops charged behind a rolling barrage and were aided by many tanks. The surprise was complete. The Allies advanced eight miles. The salient was no longer tenable, and the Germans retreated over the Vesle river, with heavy losses.

On August 8 a new offensive was launched against the salient projecting toward Amiens. The Canadian army formed the center of this attack and made a greater advance on the first day than was accomplished by any other army on the western front in the campaign of 1918.

"To make war is to attack" had long been General Foch's maxim. He followed up these initial successes and by the middle of September the Germans had been driven back virtually to the old Hindenburg Line, from which they had launched their offensive in the spring.

In these operations American troops fighting with the French and British armies played a glorious part, and General Pershing with a newly organized army performed a notable exploit by taking the St. Mihiel salient northeast of Verdun. Careful preparations were made, and an army of about 600,000, including some French troops, was concentrated for the purpose. The attack was made on September 12. The Germans, already withdrawing, were caught in the act; they lost 16,000 prisoners and the salient was wiped out. In the two months since the middle of July the Germans had lost nearly half a million men. In the words of Pershing: "The Allies found they had a formidable army to aid them, and the enemy learned finally that he had one to reckon with."

Bulgaria and Turkey Beaten. In late September the Allied army in the Balkans began a sudden offensive northward from Saloniki. In a few days the lines of the enemy were broken, and Bulgaria, threatened with annihilation, signed (September 30) an armistice which was practically an unconditional surrender. Bulgaria's withdrawal from the war isolated Turkey. The dual monarchy was attacked from the south.

On September 19, General Allenby launched a blow at the Turkish army in Palestine and in a few days practically annihilated it, taking 75,000 prisoners and 360 cannon. The victors took Damascus, and in the middle of October they reached Aleppo and cut the Berlin to Baghdad railway, thereby isolating the Turkish army in Iraq, which on October 30 surrendered to the British army under General Marshall. On the same day the Turkish government bowed to the inevitable and withdrew from the war.

The Battle of the Hindenburg Line. In the last days of September the Allies on the western front began an epic assault on the Hindenburg Line. Belgian, British, and French troops under King Albert took the offensive in Flanders. British and French armies thundered against the zone of defenses in front of St. Quentin and Laon, and a great American army, aided by French troops on their left, began a drive down the valley of the Meuse river. The German lines were broken; Dixmude, Lens, Armentieres, and the great city of Lille were taken; and in the middle of October the Germans evacuated the Belgian coast.

Meanwhile, British, Canadian, and Australian troops, aided by the 30th and 27th divisions of Americans, steadily battered their way through the immensely strong zone of defenses in front of Cambrai and St. Quentin. Tanks and artillery were used in great profusion, and defensive works were taken that had once been considered impregnable. In the second week of October, Haig's forces finally burst through the German system of defenses and took Cambrai and St. Quentin.

In front of the Americans and French in the region of the Meuse lay the rugged Argonne Forest and three German zones of defense. The Germans were not expecting an offensive in this quarter, and at first their lines were lightly held. An initial attack was made on September 26. The French forces, operating on the west side of the Argonne Forest, made good progress the first day; on the east side the Americans advanced in places for six or seven miles, but strong resistance encountered at Montfaucon and elsewhere prevented them from breaking completely through the first zone of defense, and assaulting the second, before the Germans could bring up reserves. The attack was continued the next two days against increasingly strong

resistance, due to the arrival of German re-enforcements; Montfaucon and other strong points were taken, and in the three days about 10,000 Germans were captured.

Thus began the bloodiest battle in American history, a conflict comparable to that in the Wilderness in Civil War days, but on a larger scale and much more prolonged. Both sides constantly threw fresh divisions into the fray, and every day bitter but confused fighting took place. German machine-gunners fought for every foot of ground and exacted a heavy toll from the Americans, most of whom were taking part in their first great battle. The American losses were enormous, but the troops from beyond the seas fought with a dogged determination to win through at any cost. By October 10, with French assistance, they had cleared the Argonne Forest of the enemy. The great obstacle before them now was the powerful German line known as the Kriemhilde Stellung.

By the end of October the Americans were through the Kriemhilde zone of defense, and on November 1 the final advance was begun. The third German line, the so-called Freya Stellung, was incomplete, and it was mastered with comparative ease. On November 6 the Rainbow Division reached a point on the Meuse opposite Sedan. The Americans had now attained their objective—the railways running through Sedan and Mezieres. In the words of General Pershing: "The strategical goal which was our highest hope was gained. We had cut the enemy's main line of communications, and nothing but surrender or an armistice could save his army from complete disaster."

The total number of Americans engaged in the Meuse-Argonne offensive has been estimated at 631,000, the French at 138,000, making a total of 769,000. The Germans had less than 400,000. In the battle the Americans had taken 16,059 prisoners and 468 guns; their own losses in killed, wounded, and missing exceeded 100,000. During the whole campaign the Americans captured about 44,000 prisoners and 1400 guns. In all, 2,034,000 American soldiers reached France, and of these 1,390,000 saw more or less active service at the front. In all, 29 divisions took part in active combat service.

The Americans were undoubtedly the decisive factor in winning victory; without their aid the war might have been lost. It should be remembered, however, that they came in at the end, when the enemy had been worn down. Even in the campaign of 1918 the French and British losses were much heavier than those of the Americans, and each of them captured more prisoners and guns.

Great credit is also due to the Canadians. Their troops performed some of the most brilliant exploits of the whole war, and no other soldiers were more dreaded by the Germans.

They broke through the Hindenburg Line between Queant and Drocourt. In this victory and the one near Amiens mentioned above their casualties were numerous but were exceeded by the number of prisoners which they captured. On Oct. 9 they took Cambrai and on Nov. 2, Valenciennes. A few hours before the armistice became effective, Canadian troops entered Mons, from which the British expeditionary force had begun its retreat before the on-pouring flood of Germans in the last week of August 1914.

In the whole war nearly 600,000 Canadians, 7 per cent of the population, served in the army, nearly all by voluntary enlistment. The financial cost was met largely by internal popular loans, amounting in all to $2,202,762,250 and subscribed for by well over a million persons. At the same time, special taxes were imposed calculated to retire these extraordinary loans and maintain the country's credit. Nearly 1000 ships were built during the war in Canadian shipyards for Canada or her allies. The losses in men during the war were approximately equal to those of the United States. The Canadian army captured 45,000 prisoners and retook 130 towns. A Canadian aviator, Colonel William Avery Bishop, of Ontario, was credited with 72 official victories, a record exceeded by only one German and one French aviator.

On October 24 General Diaz's army assumed the offensive in the Trentino and along the Piave river against the Austro-Hungarians. The Austrian army was broken and demoralized; three hundred thousand prisoners were taken. Revolutions broke out in Hungary and Austria, and the emperor Charles, the last of the Habsburgs, was forced to abdicate. On November 3, military representatives of the falling dual monarchy signed in the field an armistice that amounted practically to a complete capitulation.

The War Ended. With her last ally gone, Germany stood alone, facing a world of determined enemies. Before the end of September the German high command had realized that peace must be made, and, on October 4, Prince Maximilian of Baden, who had recently become imperial chancellor, sent to President Wilson a request for an armistice. Exchange of notes continued for more than a month; meanwhile the German armies were driven back, and the allies of Germany retired from the conflict. On the last day of October a mutiny began in the German fleet. In a few days uprisings took place in Berlin and elsewhere. Emperor William and the crown prince fled to Holland. On November 8 German representatives met Marshal Foch and other Allied representatives in a railway car near Rethondes, and, at five o'clock on the morning of the 11th, signed an armistice to take effect six hours later.

In the negotiations leading up to the armistice, the Germans had agreed to accept as a basis for peace the program set forth by President Wilson in an address to Congress on January 8, 1918, and in later pronouncements, particularly in a speech of September 27. In his address of January 8 the president had stated fourteen points which he considered essentials. These included "open covenants of peace openly arrived at" and no secret diplomacy in the future; freedom of the seas in both peace and war; reduction of armaments; evacuation of all territory conquered by the Central Powers, with reparation and restoration of Belgium, Serbia, etc.; Alsace and Lorraine to be returned to France; readjustment of the frontiers of Italy along lines of nationality; an independent Poland; and the formation of an association of nations to safeguard the independence and territorial integrity of both great and small states. The European allies of the United States had, however, reserved complete freedom of action on the matter of "the freedom of the seas" and had insisted that the sweeping stipulation that "invaded territories must be restored as well as evacuated" must be interpreted to mean "that compensation will be made by Germany for all damage done to the civilian population of the Allies and their property by the aggression of Germany by land, by sea, and by the air." In addition to these terms, the Germans were required by the armistice to surrender 5000 cannon, 25,000 machine guns, 1700 airplanes, all the German submarines, and practically all their above-water navy. All of Germany west of the Rhine was to be occupied by Allied troops, a neutral zone ten kilometers wide was to be drawn on the east bank, and the Allies were to have bridgeheads east of the river at Mayence, Coblenz, and Cologne.

Treaty Negotiations. The opening session of the Peace Conference was held at Versailles, near Paris, on January 18, 1919. Representatives of all the Allied nations were present, but the decisions were made by the leaders of the five chief powers.

The document containing the terms fixed upon for Germany was delivered to the German delegates on May 7. In Germany it was considered a "monstrous document," but the victors would consent to only a few modifications, and the vanquished, being powerless to resist, were obliged to accept it, the actual signing taking place on June 28, the fifth

anniversary of the assassination of the archduke Francis Ferdinand. Under it Germany gave up all her colonies, ceded Alsace and Lorraine to France and a small strip of territory to Belgium, and consented that the Sarre (Saar) Basin, with its rich iron and coal mines, should be internationalized for fifteen years, after which the inhabitants were to be given the right to decide as to their future. Plebiscites were to be held in Schleswig, Silesia, and parts of East Prussia to determine the future political affiliation of these regions, and the port of Danzig was to be internationalized. The German army was to be reduced to 100,000 men; the German navy, to six battleships, six light cruisers, and some smaller vessels. The fortifications of Helgoland were to be destroyed, and the Kiel canal must be opened to all nations. Germany accepted responsibility for all damages done to the Allies and their peoples and agreed to reimburse civilians for their losses and to restore the devastated regions in Belgium, France, and elsewhere. She also agreed to the trial of the kaiser and other Germans accused of offenses against international morality and the laws of war.

Subsequently it was found difficult to enforce all the provisions of the treaty, and some modifications were made. The claims for reparations were scaled down, and comparatively little was collected. Holland refused to give up Wilhelm II and but few of the others accused were ever brought to trial.

Treaties were later concluded with Bulgaria, Austria, and Turkey. Bulgaria was compelled to surrender territory and to pay an indemnity. Parts of the old dual monarchy were ceded to Italy, Rumania, and Poland; Hungary and Czechoslovakia were recognized as independent republics; the regions chiefly inhabited by Yugoslavs were united with Serbia and Montenegro into a greater Serbia, — the Kingdom of the Serbs, Croats, and Slovenes. Of Austria proper there remained only about 32,000 square miles, with a population of 6,000,000 or 7,000,000, chiefly of German blood. A republican form of government was adopted.

The Turkish treaty reduced the domains of the sultan to Istanbul and a small region round about it and to part of Asia Minor. An international force was to be maintained at Istanbul, and the Dardanelles and the Bosporus were neutralized. Arabia was to be independent; Iraq and Palestine were to be under British control; Thrace and the region about Smyrna, under that of Greece; and France and Italy were given spheres of influence in Syria and Anatolia respectively. The mandate over Armenia was offered to the United States, but Congress declined it.

Russian and Turkish Affairs. Unfortunately the conference was unable to bring peace everywhere to a distracted world. At the time of the signing of the German treaty a score of other wars, or conflicts amounting to a state of war, were still raging. For example, Poland was fighting the Ruthenians, the Ukrainians, the Germans, the Yugoslavs, and the Russian Bolshevists.

In Russia the Allies lent assistance to the opponents of the Bolshevists, but all counter-revolutionary movements ultimately failed. The Bolshevist regime, dedicated to an experiment in communism on a scale never before witnessed, consolidated its position as a class dictatorship by means of a Revolutionary court and the army. It survived widespread famine and acute industrial disorganization.

Turkish Nationalists refused to accept the terms imposed upon their country, and one of their leaders, Mustapha Kemal, assembled a large army in Asia Minor. Allied jealousies also complicated the Turkish situation. The main burden of opposing the Nationalists was assumed by the Greeks, who overran Thrace in the summer of 1920, and in 1921 conducted a successful offensive against the Nationalists in Asia Minor, but in 1922 the Greeks were defeated and driven out of Asia Minor. The Turks subsequently, by the Treaty of Lausanne (July 1923), obtained much more favorable terms.

America Rejects the League of Nations. In the United States a bitter political struggle developed over the peace treaty. To be ratified, the treaty had to receive a two-thirds majority in the Senate. A majority of the Senate were Republicans, and in that body, as well as among the people at large, there existed a great deal of hostility toward President Wilson. Special objection was made to Article X of the Covenant, which bound members of the League "to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League." In an effort to win popular support for the treaty and the League, President Wilson set out (September 1919) on a tour of the country, but on the way back from the Pacific coast he had an apoplectic stroke and was forced to return to Washington, where for months he was confined to the White House unable to attend to any but the most urgent public business. Meanwhile the Senate adopted a number of reservations to the Covenant, including one which provided that the United States assumed no obligation to use its military or naval forces or otherwise aid to enforce Article X unless Congress should by act or joint resolution so direct. In defense of this reservation its supporters pointed to the constitutional clause that provides that only Congress can declare war. All attempts to secure ratification of the treaty, with or without reservations, failed (November 1919, March 1920). The Senate also refused to ratify an agreement by which the United States and Great Britain bound themselves to go to the assistance of France in case of unprovoked attack by Germany. A joint resolution declaring the war at an end was passed by both houses, but the president vetoed it (May 27, 1920). Under Harding's administration a treaty embodying many of the terms of the Versailles Treaty but omitting the League of Nations Covenant was negotiated with Germany and was ratified by the Senate. On November 11, 1921, exactly three years after the close of hostilities, the two governments exchanged ratifications.

Results of the War. Three famous royal houses, the Romanovs, the Habsburgs, and the Hohenzollerns, were swept from their thrones. King Ferdinand of Bulgaria and King Constantine of Greece also lost their crowns. Monarchy, as a system of government, disappeared in Germany; the various states set up republican forms, which united into a new German republic, with Socialist tendencies, but keeping the old name of the Reich.

The Habsburg dominions were broken into fragments. Three republics—Hungary (later declared a monarchy), Austria, and Czechoslovakia—arose from the ruins, while portions were incorporated with Italy, Rumania, Poland, and Yugoslavia. Germany lost Alsace-Lorraine to France, a small district to Belgium, part of Schleswig to Denmark, large territories in the east to Poland, and all of her colonies, amounting to more than a million square miles. Bulgaria lost territory, and of the once vast dominions of the sultan nothing remained save a small tract of land about Istanbul and part of Asia Minor. Heavy indemnities were saddled upon all the vanquished peoples.

Russia, which entered the war on the side of the Entente but withdrew from the conflict before victory was won, underwent a social and economic revolution, which set off a train of events destined to lead to a still more terrible war of worldwide extent 20 years later. On her western border new states were created or old ones were restored: Finland, Estonia, Lithuania, and Poland—all republics.

The victors enlarged their territorial domains, but the condition of many of them was little better than that of the vanquished. All that took a real part in the conflict emerged from it bearing immense burdens of debt. Russia and Germany found it necessary to repudiate their national currencies. Hungary

and Austria were in scarcely less difficult situations. Even France and Italy failed to stabilize their currencies until these had dwindled to a mere fraction of their pre-War values. Great Britain was least affected financially, but her economic recovery was slow and halting.

The net result of the disorganization and economic losses of the chief belligerents was a shift in balance of strength from Europe to America. The United States became a creditor nation instead of a debtor nation. Governmental debts alone due from European nations to the United States totaled approximately 10 billion dollars. According to agreements negotiated with the individual debtor governments, these amounts were to be paid off in a period of about 60 years. The Allied powers expected to obtain the funds for payment from the indemnity imposed on Germany. Only a small fraction was ever paid.

LEAGUE OF NATIONS

During World War I, the necessity for an association of nations, to settle controversies threatening the peace of the world, was voiced at frequent intervals. Premier Asquith of Great Britain made one of the first official utterances to this effect. President Wilson, in Number 14 of his famous "Points," appealed for a "league of nations." Thus, the delegates to the Peace Conference at Paris in 1919 were generally receptive to such a plan, and several brought concrete suggestions.

Organization. The Covenant of the League of Nations was adopted by the conference April 28, and became binding, upon the powers ratifying the treaty with Germany, on January 10, 1920. The Covenant provided an organization designed to embrace eventually all independent states and self-governing dominions. The organization consisted of three parts: a Council; an Assembly; and a permanent secretariat.

The Council. The Council was composed of representatives of the British Empire, Russia, France, Italy, and nine (originally four) other member nations, elected by the Assembly for three-year periods, three being chosen each year. The Covenant provided places for the United States, Germany, and Japan as permanent members of the Council. Germany and Japan resigned from the League and the United States never joined. The Council met at least annually to deal with any matter affecting the peace of the world. Its first meeting was held January 16, 1920.

The Assembly. The Assembly was made up of representatives of nations which were members of the League. It had power to deal with any matter within the sphere of action of the League, or affecting the peace of the world. Each power was entitled to at most three delegates but to only one vote. Seven members of the British Commonwealth of Nations were regarded as distinct powers, each with one vote in the Assembly. At the seat of the League, in Geneva, Switzerland, the Assembly held annual meetings, opening on the first Monday of September.

The Secretariat. The secretariat of the League was established at the headquarters of the League in the city of Geneva. In consisted of the secretary general and the necessary staff of secretaries and advisers.

Program of the League. The nations which were members of the League agreed to respect and preserve, as against external aggression, the territorial integrity and existing political independence of all members. They were further pledged to submit, either to arbitration or to inquiry by the League, any disputes likely to lead to a rupture of friendly relations.

The Covenant also provided for the registration, with the permanent secretariat, of all treaties between states; for issuing commissions to administer territory under mandate; and for the taking over by the League of all international bureaus, with the consent of the states establishing them. The Covenant provided also for the establishment of the Permanent Court of International Justice at The Hague. Amendments to the Covenant could take effect only when ratified by all members of the League represented in the Council and by a majority of the members whose representatives composed the Assenbly.

Member Nations. At the first meeting of the Assembly, November 15, 1920, 42 states were members of the League. Its largest membership was 57, in 1934; first and last 63 nations have been members. At the beginning of 1942, the League nominally included 45 nations: Afghanistan, Argentina, Australia, Belgium, Bolivia, Bulgaria, Canada, China, Colombia, Cuba, Czechoslovakia, Denmark, Dominican Republic, Ecuador, Egypt, Eire, Estonia, Ethiopia, Finland, France, Great Britain, Haiti, Greece, India, Iran, Iraq, Latvia, Liberia, Lithuania, Luxembourg, Mexico, Netherlands, New Zealand, Norway, Panama, Poland, Portugal, Rumania, South Africa, Sweden, Switzerland, Thäi, Turkey, Uruguay, and Yugoslavia. Of these Denmark, Finland, France, and Rumania had given notice of withdrawal; Belgium, Luxembourg, Netherlands, Norway, Greece, Czechoslovakia, and Yugoslavia were under the military control of the Axis powers; Estonia, Latvia, and Lithuania were absorbed in Russia, and Poland was divided between Russia and Germany. Ethiopia had been conquered by Italy and reconquered by Great Britain.

CASUALTIES IN THE UNITED STATES ARMY AND NAVY DURING WORLD WAR I

Casualties in the Navy and Marine Corps: Killed in action, 3129; Died of disease, 6600; Wounded in action, 10,789. The Marine Corps lost 2707 killed in action; the Navy, 422.

* Note.—The figures given in the above table represent the latest available government statistics. As in the case of casualty statistics of other wars, however, they are subject to correction in detail.

Sixteen former members had withdrawn: Albania, Brazil, Costa Rica, Chile, Germany, Guatemala, Honduras, Hungary, Italy, Japan, Nicaragua, Paraguay, Peru, Salvador, Spain, and Venezuela. Russia was expelled, December 1939. Austria was annexed to Germany. The United States and Saudi Arabia had never been members.

The United States and the League. President Wilson, who represented the United States at the Peace Conference, was an active promoter of the League, and, by his insistence, the Covenant was made an integral part of the Treaty of Versailles, fixing the conditions of peace with Germany. Upon his presentation of this treaty to the Senate for ratification, serious objections were raised. The most important of these were: (1) the impairment of the fundamental principle of American foreign policy known as the Monroe Doctrine; (2) the guarantee to respect and preserve against external aggression the territorial integrity and existing political independence of all members of the League. This provision, embraced in Article X, was declared by President Wilson to be the "heart of the Covenant" and incapable of amendment without destroying the purpose of the instrument. Reservations embracing these and some minor points were framed by the Senate, and the ensuing deadlock between the president and the Senate led to the rejection of the entire treaty.

The Work of the League. Among the political undertakings of the League were the government of the Saar basin through an international commission, the protection of Danzig, the regulation of traffic on the Danube, the supervision of a corridor giving Bulgaria access to the Ægean Sea at Kavala, Greece, and the settlement of a number of geopolitical problems.

Conspicuous failures of the League to prevent conflicts include Japan's refusal to desist from "aggressive" action against China in 1931 and Italy's defiance of economic sanctions invoked after an "aggressive" warfare against Ethiopia in 1935-36. The League was helpless in the face of Germany's seizure of Austria in 1937, of Czechoslovakia in 1938, and of Danzig and Poland in 1939.

Dissolution. The League ended with World War II. A meeting at Geneva in September 1939 delegated authority for League activities for the duration of the war to a Supervisory Committee. A small part of the Secretariat remained at Geneva, while important nonpolitical branches were moved to Princeton university, Montreal, and Washington. On April 8, 1945 the last Assembly met at Geneva. Ten days later the League voted its dissolution, transferring its material property to the United Nations.

MANDATES

Politically, the term "mandate" was devised by the Peace Conference of 1919, as a system of trusteeship for the government and development of dependent peoples wrested from the possession of Germany and from the Ottoman empire.

On May 16, 1919, the Paris Conference agreed to allot to Great Britain, German East Africa; to the Union of South Africa, German Southwest Africa; to New Zealand, German Samoa; to Australia, German New Guinea, the Bismarck archipelago and adjoining islands; and to Japan, the former German islands north of the equator, with the exception of the Island of Nauru, which was allotted to Great Britain. At this same meeting, Great Britain and France agreed to divide the German colonies of Togoland and Cameroon between them. This was accomplished, July 10, 1919.

An allocation of territories of the Ottoman empire was accomplished at the conference of San Remo, April 18 to 25, 1919, where the representatives of Great Britain and France agreed that the former power should receive Iraq and Palestine, and the latter, Syria and Lebanon. A subsequent agreement, at Paris, December 23, 1920, transferred a portion of Syria to the British mandate of Palestine, and France received, as a consideration, a share in oil land concessions in Iraq, and other advantages.

PERMANENT COURT OF INTERNATIONAL JUSTICE (WORLD COURT)

The establishment of an international court for the adjudication of disputes between nations was provided for by the Peace Conference of 1919. Such a tribunal had already been proposed by Elihu Root in 1907. An arrangement in 1910 to which the United States, France, Germany, and Great Britain were parties was stopped by the World War. Pursuant to Article XIV of the Covenant, the Council of the League, early in 1920, appointed a committee of jurists to formulate a plan or organization. With some modifications, this plan was adopted by the Assembly of the League of Nations, December 13, 1920.

Organization. The Court consists of 15 members, elected for terms of nine years by the Assembly and Council of the League of Nations from a list of names nominated by the panels of jurists from which members are appointed to the Permanent Court of Arbitration at The Hague.

Jurisdiction. For trial of international disputes, the court is open to members of the League and to states mentioned in the annex to the Covenant of the League. States ratifying its constitution may recognize as compulsory the jurisdiction of the court in any or all of the following classes of legal disputes: (a) the interpretation of treaties; (b) questions of international law; (c) the existence of any fact which, if established, constitutes a breach of international obligations; (d) reparation for such a breach. Over 45 nations, including Great Britain, France, Italy, and Japan, accepted this compulsory feature.

The court, in making its awards, was to apply the principles of international conventions, international law, general principles of law recognized by civilized nations, and, as a subsidiary means of determining the rules of international law, the teachings of the most highly qualified publicists of various nations. A majority of the court might render a decision. The court was empowered to render advisory opinions.

The Permanent Court of International Justice was dissolved by the last Assembly of the League of Nations. It was replaced, and its work continued by the International Court of Justice, organized at the Hague, April 18, 1946, under the charter of the United Nations.

REPARATIONS

Under the Treaty of Versailles a commission was set up to fix the amount of the reparation payments to be made by Germany and to determine its division among the recipients. A definite assessment was finally made on April 21, 1921, at London. It amounted to about 32 billion dollars.

The first plan for collection proved impossible. Under the Dawes plan of 1924 and the Young plan of 1929, the total was finally scaled down to 8.806 billion dollars, as of September 1, 1929. Payments were to be spread over 59 years. In July 1931 a one-year moritorium was granted; no payments were made thereafter. The amount actually paid under all the plans was about $4,470,300,000.

BANK FOR INTERNATIONAL SETTLEMENTS

This bank was created under the Young plan to handle the reparation funds. It was in addition to provide facilities for international financial operations. It was organized in May 1930 with headquarters at Basel, Switzerland. Its directors are named by the central banks of the leading countries. It cannot issue currency or make loans to governments. It may, however, hold gold reserves for central banks, thus reducing the need for shipments and acting as a clearing house.

WORLD WAR II

As compared with World War I, World War II was more nearly a universal war. It was also much more complex. Many of its issues grew out of World War I but many others did not. Both wars might be regarded as phases of a continuing struggle to determine by whom the world should be controlled.

Such struggles had been going on from the beginning of history, but the advances of the last century in the means of transportation and communication and in the mechanization of production made it possible to correlate activities of armed forces on a global scale. They also made war potentially more decisive, for the victor would control the means necessary for any resistance, present or future, and the vanquished would be powerless. The rapidly increasing population of the world added an element of urgency.

Comparison between the Two Wars: The Line-Up. In both wars Germany was the leading antagonist against an alliance of other powers. She had as allies in World War I Austria-Hungary and later Bulgaria and Turkey. In World War II, Germany, enlarged by portions of the old Austria-Hungary, was joined by Italy and Japan. She also had the more or less reluctant assistance of four satellite states—Finland, Hungary, Rumania, and Bulgaria. Early conquests gave her control of the resources, human and material, of Norway, Denmark, France, Belgium, The Netherlands, Poland, Yugoslavia, Greece, and part of Russia.

Great Britain and France were leading powers against Germany at the opening of both wars. In World War I Russia was an ally from the first, but she did not enter World War II until attacked in mid-1941. As the war enlarged, however, the alliance against Germany embraced also the United States, China, the nations originally non-belligerent which Germany had conquered, and a number of countries of Latin America, the most active of which was Brazil.

Geography of the War. World War I was waged almost exclusively in Europe, though operations were carried on to some extent also in Africa, in southwestern Asia, and on the high seas. With World War II, besides the primary conflict in Europe, eastern Asia and the Pacific became a major theater of warfare; Africa was involved from the equatorial lakes to the Mediterranean; Australia was attacked; even the Americas found their outlying shores and islands within the zone of conflict. Air power made war on the oceans more widespread and intense.

Weapons and Methods. These and other contrasts were due to radical developments in weapons and methods of their use, particularly the airplane, the tank, and electrical devices.

Airplanes.—Airplanes during World War I had been used chiefly as the "eyes" of the land forces; combat had been incidental to their major use, and bombing raids were few. During World War II, they constituted a fighting force without which no army or navy could achieve victory. The airplane and glider were also developed for the transport of troops to hostile islands or behind enemy lines.

Still more revolutionary was the use of airplanes to destroy entire cities, wiping out large sections of a nation's production and transport facilities. The airplane above all other weapons brought civilians into the center of warfare, for in such raids little discrimination of "military objectives" could be made.

The airplane also greatly altered the form of naval warfare. By means of aircraft transported on carriers battle fleets were enabled to concentrate striking power against opponents long before ships came within range of each other.

Tanks.—The caterpillar tractor, already used in agriculture and industry, was applied to armored motor vehicles in World War I. Such bullet-proof tanks broke down the advantage which the machine gun had given to the defense. In World War II the tank was given heavier armor and heavier guns, which made it extremely formidable despite development of anti-tank guns. Above all, its speed was increased. Tanks moving at forty miles an hour were fortress and cavalry combined. Land and amphibious truck transportation and the equipping of ordnance with self-propulsion vastly increased mobility.

This superior mobility made World War II predominantly a war of movement. Conflicts of tank divisions became a feature of most battles. Add to this the immense numbers of troops employed, and a single battle might cover a terrain hundreds of miles in extent. Whereas in 1815 the battle of Waterloo, fought within an area less than three miles square, decided the fate of Europe, in 1940 the battle of Flanders, with a battle line a hundred miles long, was merely one phase of an operation extending from the North Sea to the Pyrenees.

Electrical Devices.—Radio communication, in its infancy in World War I, was a necessity of World War II. Only by means of radio signals could the movements of airplanes, tanks, and motorized troops be co-ordinated. Radio beams directed air raids. "Radar," a newly developed electrical instrument, permitted detection with amazing accuracy. Electrical sighting devices were used for bombing and anti-aircraft guns, for naval guns, and torpedoes.

Importance of Productive Facilities. World War I marked a real departure from previous wars in the extent to which the decision turned on the manufacturing ability of the participants and of the nations which could be counted on to supply them. The greater ascendancy of machinery in World War II made the ability to produce and supply such machinery an indispensable element of success. This brought the factory into the battle line, for the destruction of the factory and its civilian worker became as necessary and almost as desirable as the destruction of a field force. In the airplane was found an ideal weapon for that purpose. Protection against an air raid is difficult, retaliation is much easier. But the airplane can only strike and destroy, it cannot capture and carry away. So sheer destruction became more than ever before a dominant feature of war. The phrase "total war" began to be used, implying that every element of a nation's life and energies must be employed for victory. The civilian at home was a participant as truly as the soldier in the field—and therefore equally open to attack.

Psychology and Economics. On both sides psychological weapons were used with new skill. "Wars of nerves" played on the popular fears and uncertainty by radio, leaflets, and press reports. Economic threats and trade agreements were used to bring under control smaller countries, especially those with useful natural resources.

Causes of the War: The Heritage of World War I. Two main groups of causes combined to bring about World War II. First were questions inherited from World War I: the desire of Germany to regain her lost territory and prestige; the desire of the winning powers to hold their gains; the dissatisfaction of some of them with their share of the spoils; and the fear by the new national governments created after the war of losing their independence, particularly in view of the frequent existence of dissatisfied minorities within their borders.

Causes of the War: The Conflict of Ideologies. Before the war and in its early stages, an ideological conflict, cutting across national lines, appeared as a prominent factor. As the war went on, this element was pushed into the background by rising national feeling and power politics. With the end of the war, the ideological conflict showed signs of revival, but on different lines: a leftward tendency within the western European democracies, and signs of divergence between them and communist Russia.

Communism. The Russian revolution represented the first large scale application of Marxian

socialism. The absolute control of the individual it involved was the antithesis of the individual freedom which was the ideal of democratic nations. A government based on control from the top and by the Communist party professed to attend a future return to individual freedom, but that future was distant. One reason was the belief of the leaders in a future struggle with capitalistic countries. To prepare for the struggle they worked for the extension of the party to other countries, enlisting party members abroad, and training them, for action in the party interest, even against their own country

Anti-Communism. The natural result was agitation and organization against Communism. This feeling helped Mussolini and Hitler. Hitler was aided also by the economic depression, a powerful factor in bringing about other dictatorships after 1930. The peoples were willing to follow any leader who promised to help them. This internal social conflict helped also to paralyze the resistance of small countries to the possible danger from Fascism. Pacificism also played a part. But the German leaders were not pacifists. See *Germany*, *Hitler, Adolf*, *Anti-Semitism.*

The Axis and the Anti-Comintern Pact. In 1935 and 1936 Germany and Italy developed a common policy based on opposition to communism as embodied in the Russian-controlled Third Communist International (Comintern) and also to democratic governments and their principles. Both nations, moreover, asserted their need of expansion to relieve their growing populations. This understanding, popularly referred to as the Rome-Berlin Axis, met a sympathetic response from Japan.

On November 25, 1936, Japan and Germany signed the Anti-Comintern pact, ostensibly providing for consultation and cooperation against the Communist International but directed also against the democratic governments. Other powers which might feel themselves threatened were invited to join. Italy joined the next year and was followed two years later by Manchukuo, Hungary, and Spain. The agreement was to last for five years. On its expiration in 1941, it was renewed at Berlin, and seven other governments adhered: Bulgaria, Croatia, Denmark, Finland, Rumania, Slovakia, and the Nanking government of China, while the Vichy government of France endorsed its principles.

Beginnings of the War. It is part of the complexities of World War II that no one date can be confidently fixed on for its outbreak. There is rather a series of dates on which different stages of the war began.

Of the dates which might be selected, the most important are:

September 1, 1939, when Germany invaded Poland, thus bringing France and Great Britain into the war;

June 22, 1941, when Germany attacked Russia;

December 7, 1941, when Japan attacked the United States.

There are, however, several earlier dates, marking the stages of its approach, when hostilities were begun which preluded or merged into the general war. These dates are:

September 18, 1931, when Japan occupied Mukden and began the conquest of Manchuria, which it erected into the puppet state of Manchukuo;

July 7, 1937, when Japan attacked China proper, thus beginning a war which later became an integral part of the larger global war after Japan had attacked the United States and Great Britain;

October 1935, when Italy began the conquest of Ethiopia in an attempt to build up her African empire;

July 17, 1936, when a conservative party rebellion against the left-wing government of Spain provided an opportunity for the Fascist powers to set up a government favorable to their cause;

March 12, 1938, when Germany occupied Austria;

October 1, 1938, when Germany took over the Sudetenland from Czechoslovakia.

Expansion by Italy and Japan. Beginning with 1935, the axis powers, either by war or other politico-military techniques, expanded their territories. Italy conquered Ethiopia in 1935–36. When the League of Nations attempted to enforce sanctions Italy resigned, as Germany and Japan had done the year before. In April 1939, Italy overran Albania, which was erected into a separate kingdom under the king of Italy.

Japan had seized Manchuria in 1931 and the northern provinces of China in 1935. In 1937, she entered upon an undeclared war with China. By 1939 she was in control of the coastal regions and of most of the large cities, and had set up a puppet government at Nanking. But the Chinese under Chiang Kai-shek still held out in the interior.

The Spanish Civil War. As the Balkan Wars had been a prelude to the First World War, so the Spanish Civil War preceded the second. It had started in appearance as a revolt of the conservative army leaders, representing the monarchical and clerical tradition of old Spain, against the Republican government. The communist wing of the Republicans gained control and was supported by Russia to the end, while the Insurgents, quickly assuming Fascist forms and principles, received men and munitions from Germany and Italy. Great Britain, France, and the United States pursued a policy of non-intervention which operated decisively against the Government. The war ended in 1939 with the triumph of the Insurgents under General Franco and the establishment of a totalitarian government bound by close ties to the Axis.

German Expansion. In 1935 a plebescite in the Saar District, in accordance with the Treaty of Versailles, resulted in a ten-to-one vote in favor of reunion with Germany. Germany was now showing her intention of disregarding all the restrictive clauses of the treaty. In 1936 she reintroduced conscription and began to rearm. The Rhineland was again occupied by German troops and fortified while France and Britain looked on. They remained silent. Hitler then turned to Austria. The government of that country was now a practical dictatorship under Chancellor Schuschnigg after the Socialist party had been suppressed. Schuschnigg made a gesture of resistance by calling for a plebescite, whereupon Hitler, on March 12, 1938, moved German troops into Austria and occupied the country. A vote taken under German auspices showed a heavy majority for union. Austria became the *Ostmark.*

The Munich Pact. Czechoslovakia came next. The Versailles treaty had included in that country border districts largely populated by Germans—the Sudeten lands. These claimed to be treated unfairly by the Czechs, appealed to Hitler for aid, and threatened revolt. The Czech government appealed to France, England, and Russia for assistance. A crisis threatened which might result in a European war.

Premier Chamberlain averted the immediate danger by flying to a conference with Hitler at Berchtesgaden. England and France advised Czechoslovakia to submit, and with Mussolini's help, persuaded Hitler not to use force. The final adjustment was made at Munich, September 29-30. The parties were, in addition to Hitler and Mussolini, Neville Chamberlain and Edouard Daladier, premier of France. Russia was ignored. Czech territory with more than fifty per cent of German population was taken over by the Reich. Final determination of the boundary was to be made by a commission of the four powers and Czechoslovakia.

The Fruits of "Appeasement." Chamberlain's action was generally approved in England. Hitler had promised at the time of the Munich pact, to respect the independence of Czechoslovakia, and had said that Germany had no further territorial claims in Europe, but he made no opposition when Hungary and Poland took parts of the weakened state and when Slovakia demanded autonomy. In March 1939,

on the occasion of trouble in Slovakia, Hitler moved troops into Bohemia and Moravia, and declared them a protectorate of the Reich. Slovakia became independent, but under German control. Great Britain, France, Russia, and the United States, refused to recognize the new status. In March 1939 also, Memel, with a large German population, was yielded by Lithuania. All these additions to the Reich were justified by the Germans as reclamations of territory unjustly taken from them in World War I.

Germany, Poland, and Russia. Hitler now turned to Danzig and the Polish corridor. The corridor, cutting off East Prussia from the rest of Germany, had been created to give Poland an outlet to the sea; a large part of its population was German. Danzig, German from its foundation, had been made a free city under the League of Nations with guarantees for German and Polish commercial rights. Near it, the Poles had built their own seaport of Gdynia. Hitler was now demanding that Danzig be returned to the Reich with guarantees for Polish commercial rights and that Germany be given an extraterritorial corridor across the corridor. Poland refused, and the deadlock continued for several months.

One reason for the delay was the position of Russia. Great Britain had already declared, on March 31, that she would support the Poles against any action which threatened their independence. France was committed to the same policy. But Russia was the only power which could give Poland real military assistance against a German attack.

Russia had formerly cooperated with Great Britain and France, fearing Nazi policies. The western powers had ignored her in the Munich agreement. Now Britain and France asked her support for Poland. Stalin, now the real ruler of Russia, negotiated with both sides. At last, on August 20, 1939, he signed a trade treaty with Germany and, four days later, a ten-year non-aggression pact.

Stalin gained by this treaty the time which Russia needed to strengthen her army and defenses against a possible German attack. He also divided the western powers, setting Great Britain and France against Germany. The price he received was a free hand with the Baltic states and Poland. The immediate effect was to free Germany from any fear of an attack from the east, and to cut off Poland from any effective military assistance.

The news of the German-Russian alliance burst upon the world like a thunderbolt. But if Hitler expected it to deter the British and French from going to war, he was disappointed. Neville Henderson, the British ambassador, made it clear that Great Britain would fight if Poland was attacked.

At the last moment Germany put forward proposals for a peaceful settlement, but the Poles were given no opportunity to consider or hardly to understand them. On September 1, the German armies invaded Poland. For two days longer the British and French governments, without success, continued to urge withdrawal of the troops and a conference. On September 3, at 11 A.M., Great Britain declared war; six hours later France followed her example.

Great Britain was followed in its declaration of war by most of the British dominions. Australia and New Zealand declared war simultaneously; Canada settled a constitutional question without raising it by delaying her declaration of war until her parliament had acted on September 10. South Africa, after some deliberation and a change of ministry from General Herzog to General Smuts, severed diplomatic relations on September 5. Eire, refusing to follow the other dominions, remained neutral.

The Polish War. Poland had no natural frontier defense. The surface of the country was generally level, dry at that time of year, ideal terrain for mechanized armies. The industrial district was near the German border. To defend this open country the Poles had about 600,000 men and 900 planes.

The Poles hoped to delay the Germans in western Poland, and on the line of the Vistula, until the fall rains and the English and French armies in the west could come to their relief. The German plan was a double "pincers" movement. Two armies converged on Warsaw from East Prussia and Pomerania; two others, cutting off the industrial district, and outflanking the Vistula line, converged upon Warsaw from the south and southwest. Germany used most of her first line troops, almost a million men. General von Brauchitsch was commander in chief, General von Bock led the northern army, and General von Rundstedt, the southern.

It was the German plan which succeeded. The Poles were driven back in the north and west and were outflanked in the south. The rains did not come. The Germans made abundant use of mechanized troops, but a great part of their success was due to air power. Their overwhelming air force crushed the Polish air defense at the first onslaught, broke up the mobilization by attacking concentration points, especially in eastern Poland, bombed Warsaw and other cities, and kept the Germans fully informed of Polish troop movements. On September 5 the Germans were within 40 miles of Warsaw, on the 6th the southern army entered Krakow, by the 14th the Germans were closing in on Warsaw itself. The western army was cut off; the only hope of the eastern army was to make a last stand in the marshes on he eastern border.

Poland's deathblow came from Russia. On September 17 Russian troops, "to protect Russian interests and the White Russian and Ukrainian minorities," entered Poland and occupied the eastern half, as far as Brest-Litovsk and Lemberg (Lvov), with little resistance. Half a million Polish troops were captured. Warsaw held out until the 27th.

Danzig, the occasion of the trouble, had, meantime, announced its union with the Reich.

President Moscicki and the Polish government fled to Rumania, thence to France, and ultimately to London. They organized a government which Great Britain, France, and the United States continued to recognize as the legitimate Polish government.

Germany and Russia now divided Poland—its fourth partition—on the general lines of the Bug and San rivers, the "Curzon line." Russia received the larger territory, but the smaller population. Her share was mostly annexed to the Soviet Republics of White Russia and the Ukraine, with which its population was racially connected. Germany left the part around Warsaw for the Poles, and prepared the rest for German occupation. The price the Germans paid was 43,000 casualties, 10,000 killed.

Defensive Attitude of Allies. France and Britain had declared war, but in neither country was the mental attitude propitious for victory. England was trusting to her seapower and her blockade; France, to her fortifications. In England Chamberlain, a competent peace minister, was not the man to conduct a war. In France, the administration was weakened by personal rivalry and party politics. In both countries pacifist feeling was strong. Both countries were thinking first of defense. Germany, schooled by her years of adversity under the Versailles treaty, and forced by her disarmament to start from scratch, could take advantage of changes in technique to develop a new army and a new type of war, the *Blitzkrieg*.

British and French Preparation. Great Britain had introduced compulsory military service in May 1939; now the draft was extended to men twenty to forty-one. The "territorials" (militia) were increased. Air raid precautions were taken and a rationing system was set up. France was more advanced in preparations. The Chamber in May had given Daladier "full powers" for national defense. Very early in the war a joint war council was established to co-ordinate operations.

Strength of the Opposing Forces. On paper the armies were not very unequal. Germany had potentially six million men, 160 divisions. Against these England could bring about four million men, 600,000 being in the regular army. France had 765,000 regu-

lars, with 4,250,000 reserves. The German army, however, was at home. and could be used there. The British and French armies had the areas of their empires to cover.

In naval strength, especially in capital ships, the Allies had an overwhelming advantage, but the Germans were strong in submarines. In the air the Germans had 11,000 planes against the Allies' 8,000, and superior facilities for replacement.

Maginot and Siegfried Lines. In the hope of preventing such an invasion as they had suffered in 1914, the French had constructed their great Maginot line, so called from the war minister who had initiated its construction. This was a continuous fortification from Switzerland to the Belgian border. It cost $150,000,000, and was believed impregnable against assault or siege. Unfortunately, it was not continued along the Belgian border. Over against it, the Germans were hastily building the Siegfried line, or Westwall, a zone of disconnected but supporting redoubts, 30 miles wide.

When Poland was attacked, the French manned the Maginot line, but failed to use their time to strengthen the defenses on the Belgian border. They made only futile demonstrations against the German reserves in the Siegfried line. A British expeditionary force of 350,000 men, under General Viscount Gort, took over a sector near Luxembourg in December. General Maurice Gamelin, commanding the French army, was made commander in chief of the Allied armies. The British Admiralty directed the navies.

First Stages of the War at Sea. Naval warfare was begun at once by Britain on the lines of World War I. The battle fleet was concentrated at Scapa Flow and in the Firth of Forth. A strict blockade was established. Control ports were set up at strategic points, and the usual friction with neutral powers began.

The Germans at once began a counter-blockade. They had about 50 submarines and were building more. They sent them out to prey upon enemy commerce and sank 785,000 tons of shipping, neutral as well as allied, in the first four months. The British met the attack with some success by using the convoy system. Both sides laid mines.

German submarines sank two British capital ships but only one real ship action occurred, the sinking of the *Graf Spee.* She was driven into Montevideo, Uruguay, by three British cruisers, and scuttled in the River La Plata.

Russia Moves on the Baltic. As soon as the treaty with Germany was signed, Russia began to move on the Baltic with German approval. Her aim was to regain control of the Baltic states—Finland, Estonia, Latvia, and Lithuania, which had become independent in 1919. In September and October 1939 she obtained treaties of "mutual assistance" which gave her military control of the eastern end of the Baltic. Then the Communist parties within the states acted, and in July 1940 Latvia, Estonia, and Lithuania were admitted to the Soviet Union.

The Finnish War. Finland, however, was stronger and less complaisant. She refused Moscow's demands for a cession of territory at the head of the Gulf of Finland. On November 30, Russia invaded the country, alleging the necessity of defending Leningrad from attacks by or through Finland.

The key to the Finnish defense was the Mannerheim line, across the Karelian isthmus, from Viborg (Viipuri) on the Gulf to Lake Ladoga. To defend these works and the long eastern boundary General Mannerheim had 225,000 trained troops and a militia force of about 100,000.

For two months the Finns repulsed the Russians from the Mannerheim line and threw back attacks around Lake Ladoga and along their eastern frontier, though the Russians took Petsamo in the north. The weather, exceptionally severe, was on their side, and the Russian troops were second-rate and poorly led. In February the Russians sent better commanders with more troops, bringing their force up to 800,000, and broke through the Mannerheim line

The Scandinavian countries, though traditionally suspicious of Russia, gave Finland no open assistance. Fearing German reprisals, they refused passage to British and French troops.

On March 12, a treaty was signed at Moscow by which Finland gave up Viborg and the Karelian isthmus, leaving her defenseless in that quarter. The cession of Hango and its islands completed Russian control of the Gulf of Finland.

The Norwegian War. Norway, Sweden, and Denmark had hoped to maintain their neutrality in this war, as in the last. Sweden alone succeeded.

Norway lay between the two belligerents. The Germans alleged that her neutrality had been invaded by the British seizure of a German prisonship in Norwegian waters, and by British mine-laying in the route of ships bringing iron ore from Narvik. Under pretext of protecting Norway and Denmark from Allied invasion, the Germans themselves invaded these countries on the night of April 9, 1940. They promised the territorial integrity of both countries in the future.

Denmark could not resist, and King Christian advised his people to make no opposition. But outside the continent, Iceland declared its independence, and received a British garrison; Greenland turned to the United States for support; and the British occupied the Faroe Islands.

In Norway the German attack was directed against Oslo, and the western ports of Bergen, Trondheim, Narvik, and Stavanger. The attacking force numbered about 25,000, later increased fourfold. Norway had about 15,000 trained soldiers, and no air force to speak of. Oslo was taken, but the king, ministry, and parliament escaped.

Most of Norway's wealth, population, and resources are concentrated south of Trondheim, in the coast towns, and the two river valleys, Ostendal and the Godbrandsdal. The Germans had already seized the coast towns. They now fanned out from Oslo up the river valleys, meeting brave but inadequate resistance. The Allied troops sent to assist Norway were too few and came too late. By early June the Norwegian army had surrendered and the Allies were forced to withdraw.

By this success the Germans had made secure their ore supplies from the Swedish mines, clinched their hold on Sweden, blocked any chance of attack from the north, and secured bases for sea and air operations against Britain.

King Haakon, his family and ministers escaped to England. Since the Storting had authorized him to act from outside Norway, his continued to be the only legal government. The gold reserve had been sent to England, and the Norwegian merchant marine obeyed his orders. The Germans set up a government of Nazi sympathizers, headed by Vidkun Quisling, which met determined resistance, active and passive. See *Quisling.*

The Norwegian fiasco brought about the fall of the British cabinet headed by Chamberlain. He was succeeded by Winston Churchill, who told the Commons, quoting Garibaldi, "I have nothing to offer you but blood, toil, tears, and sweat."

The Invasion of the Netherlands. Scarcely had Winston Churchill taken office when he had to meet a new German attack on the Continent. On the morning of May 10 the Germans, without a formal declaration of war, poured over the borders of the Netherlands and Belgium.

Unlike Norway, both countries were ready for and expecting an attack. Both had counted on holding their defense lines until help should come from Great Britain and France. Both countries had insisted on their neutrality to the last, and no Allied troops were in either country when the invasion came.

The Germans crushed the Dutch resistance in the north of Holland and cut off relief from the south. Air power, with the use of parachute troops, and the fifth column, partly of pro-German Netherlanders,

wrecked the Dutch resistance. Airfields were seized, Rotterdam was bombed, the Dutch army, under General Winkleman, fought bravely, but was forced to surrender May 14.

On May 13th Queen Wilhelmina with her ministers left the Hague for England on a British cruiser and she continued to govern the Dutch colonial empire from London. They had brought with them the Dutch gold reserve and control over the great Dutch merchant marine, which was largely still at sea. The Germans organized in Holland, as in Norway, a government of Dutch Nazis.

The Battle of Flanders. This name is given to the fighting in Belgium and northern France between the German frontier and the Channel ports. On the morning of May 10 the German army swept into Belgium.

In this quarter Belgium was defended by Liège and its forts,, the fortified line of the Albert canal, and the supposedly impassable ground of the Ardennes Forest. To defend these the Belgians had mobilized perhaps 800,000 men. General Gamelin had assumed that this line would delay the Germans for four or five days, giving the Allied forces time to establish themselves on the line of Antwerp-Louvain-Namur for defense or counterattack. Accordingly, on the first news of the German invasion, the British expeditionary force and three French armies left their defensive positions in northern France and moved north into Belgium.

But the Germans moved too rapidly. They attacked Fort Eben Emael, north of Liège, and crossed the Albert canal on the first day of their advance. On the second day they had taken or destroyed the defenses of Liège. The Albert canal defenses gave way entirely, perhaps through treachery, and the invaders were passing the Ardennes, threatening the right flank of the Allies moving north.

The French Ninth Army under General Corap was to occupy the defenses along the Belgian border, but the Germans struck it before it got fairly into position. The Ninth Army disintegrated. Sedan was taken, and with it the bridge over the Meuse, which, for reasons never fully explained, had not been destroyed. The rout of Corap's army opened a gap fifty miles wide in the French line, and through it the invaders poured, heading westward to the sea.

The Allied forces in Belgium now met the main German advance in a confused struggle. In a tank battle near Gembloux the French fought creditably, but were outnumbered. Meanwhile the German air force operated in the rear of the Allied army, bombing the advancing reserves, the railways, and concentration points. The Allies found their movements handicapped by the crowds of fleeing civilians, panic-stricken by the planes which swept over them and machine-gunned them as well as troops. On the 17th Brussels, whence the Belgian government had already removed to Ostend, was occupied by the Germans, and Namur was taken. On the 18th the Germans entered Antwerp. The plan for a second line of defense had broken down.

Meantime the Nazi southern column was driving west across northern France. It passed the Aisne and Oise rivers and swept down the Somme valley. On the 20th it had reached Cambrai, the scene of the Battle of the Somme in 1916. On the 21st the Germans entered Amiens, which they had just failed to reach in 1918. The same day they reached Abbeville, at the mouth of the Somme.

It was now evident that the French high command had made a terrible mistake in the movement north. The Belgian army, the British Expeditionary Force, and the remnants of three French armies, the First, Seventh, and Ninth, were pressed by the Germans from the north and east, the advance of the southern column had cut them off from the main French army. Their only source of supply was the Channel ports, which were being bombed by the German air force, while the German mechanized columns, having turned north, were attacking from Arras and driving along the coast. Boulogne was taken on the 28th, and fierce fighting began near Calais. The Allies were now pressed back into a rough crescent around Dunkirk, with the Belgian army forming the north wing.

There was still hope if they could break through to the south, and such a movement, co-ordinated with a French attack from that quarter, would put the long, thin German salient in grave peril. General Weygand, who had replaced Gamelin in command of the French army, began to mass troops near Amiens for such a movement.

Any chance for the forces cornered in Belgium vanished when, on the morning of May 28, the Belgian army was surrendered by King Leopold, who declared that his army was starving and out of ammunition. The Belgian surrender exposed the right flank of the British. They could do nothing but fall back upon Dunkirk, the only port left in their hands. With them were a few Dutch troops and the remains of the French armies, about 400,000 men in all.

Dunkirk. The evacuation of the British army from Dunkirk was the one bright spot in the gloomy picture of disaster. The nearly 400,000 men in the town and its environs were crowded into an ever narrowing space by unceasing attacks, under fire from the German batteries, and bombed at times by the German airplanes. Military experts estimated that possibly 25 per cent of them could be rescued. British cruisers and destroyers fought off German submarines in the Channel. British and French aircraft, helped by cloudy weather, struggled with enemy planes above the town, and for a few days kept qualified control of the air. The British garrison in Calais fought to the last man to gain time.

Meantime every available craft on the opposite coast, merchant ships, tugboats, ferryboats, fishing boats, pleasure craft, river steamers, was called into service to assist the navy and the army transports in bringing the cornered troops to safety.

While the rearguard fought desperately on the hills around the town, this nondescript transport fleet took off the soldiers, dropping from the ruins of the shattered piers or wading out in long lines into the shoal waters from the beaches. Loaded to the gunwale, they steamed off for the English coast—and came back for more. The Admiralty estimated that 222 naval vessels and 665 other craft, besides French naval and private vessels took part in the embarkation. For three days and nights the evacuation went on. When the Germans finally forced their way through the town, 335,000 men, more than three-fourths of the Allied force were in England. All their heavy arms and equipment were lost.

The Germans now held all the Netherlands and Belgium, with a strip of northern France, including the Channel ports. The Dutch and Belgian armies were non-existent. The British Expeditionary Force had been driven off the Continent, and three French armies had been cut to pieces. In all the Allies had lost not far from a million men, including the larger part of their mechanized forces. The price the Germans paid, according to their own statements, was 10,252 dead, 42,523 wounded, and 9,463 missing.

The Collapse of France. The German army now turned southward. General Weygand was attempting to form a new line on the Aisne and Somme, but his troops had lost confidence in their commanders. Nevertheless, the Germans admitted losses of 17,000 killed and 68,000 wounded before the armistice.

The Germans now threatened Paris from two directions—from Rouen on the west and from the Marne on the east. The French government retired to Tours and later to Bordeaux. On June 13, Paris was proclaimed an "open city" and evacuated; the Germans entered it the next day without resistance. Verdun fell on the 15th, and the impregnable Maginot line lost its significance; Weygand withdrew a part of its garrison to a new line he was attempting to form on the Loire; the rest surrendered.

Italy, thinking the end was in sight, declared war on June 10, 1940. She made some slight advances in

the Alps and on the southern coast, but her action made very little difference.

On June 16 defeatist elements in the French cabinet forced out Premier Reynaud. He was succeeded by Marshal Pétain, now controlled by a fascist group. The new government ignored its promise to make no separate peace, gave up its opportunity to retreat to Africa and carry on the war from there, and on June 17, asked for an armistice. It was signed on June 22; fighting ceased on June 25. The Germans staged the signing in the same railroad car, and at the same spot, Rethondes, where Germany had received the armistice terms of 1918.

Under the armistice the Germans occupied Paris, the northern industrial districts and the west coast. The Italian border, the Mediterranean naval bases, and certain African districts were to be demilitarized. The French navy was concentrated and disarmed; the army demobilized; German and Italian prisoners were released. French communications and trade passed under German control. Pétain set up his government for unoccupied France at Vichy.

Control of Colonies. All five of the conquered countries had dependencies which remained out of German control. On Spitsbergen, Norway's arctic coal-mining settlement was destroyed by an Anglo-Norwegian expedition in September 1941, and the population was removed. A later German attempt to occupy the islands was destroyed. The action of the Danish colonies has been described. The Dutch colonies obeyed the queen and her government in London; Belgian Congo, the ministers of the captive King Leopold.

The French colonial empire was divided. Indo-China passed into the hands of a watchful and aggressive Japan. North Africa and West Africa, with Madagascar, obeyed the Vichy French government, as did the West Indies. One of the younger French generals, Charles de Gaulle, fled to London at the armistice and organized there the French National Committee, the "Free French" government, which was recognized by Britain. This government was recognized by French Equatorial Africa, French Cameroon, and some of the Pacific dependencies. In September 1940, with British assistance, he made an unsuccessful attempt to take Dakar, in French West Africa. In May and June 1941, Syria and Lebanon were forcibly occupied by British and Free French troops.

The Siege of Britain. After the fall of France Britain alone seemed to stand between Hitler and complete victory. There is some evidence that he expected her to yield and delayed his attack. But Britain had in Winston Churchill a leader who refused to acknowledge defeat. The British set to work with feverish haste to transform their country into an armed camp. The government was given absolute power over persons and property. Potential "fifth columnists" were imprisoned.

Whether an invasion was actually attempted was never made known, but there is considerable evidence that a large scale rehearsal met with disaster. At any rate, the German attempts to "soften" Britain by air attack definitely failed.

After a period of comparative quiet following the French armistice, German air attacks became more intense and frequent. They culminated on August 15, when wave after wave of planes swept over England, ranging as far north as Scotland. The British claimed to have brought down 180 planes on this occasion and 185 during a raid on London on September 15. No raid at this time was participated in by as many as 500 planes. Losses of this proportion appeared ruinous, although the British air strength, technically superior but much inferior numerically, had been whittled down to dangerously low levels. At any rate, daylight raids were abandoned.

The Germans then turned to night raids and, for 13 consecutive nights in September, did terrible damage to London, striking Buckingham Palace, the British Museum, and the Houses of Parliament. Outlying cities like Birmingham and Coventry, harbors like Southampton and Bristol were attacked. At Coventry, on the night of November 14, an intensive raid showered bombs on the city for ten and a half hours. At the end of the year, official figures showed 23,081 killed and 32,296 wounded as a result of the raids.

The Royal Air Force retaliated with raids upon German cities. The striking force of their air power steadily grew until the blows they struck dwarfed anything the Germans had attempted.

At sea the British blockade still made itself felt in the Axis countries, though severely handicapped. The German counter-blockade at sea became more effective and caused serious losses in 1941 and 1942.

Two incidents of naval warfare may be mentioned in this connection. While the French armistice only provided for its internment, the British had always feared the acquisition of the French fleet by Germany. On the refusal of the squadron at Oran, in Algeria, to surrender or proceed to the West Indies, the British attacked it and destroyed its most important ships, July 3, 1940. In May 1941, the new German battleship *Bismarck* sank the *Hood*, the largest of the British battle fleet, in an encounter near Greenland. A few days later, other units of the British navy, assisted by aircraft, sank the *Bismarck*.

Italy in the War. The entry of Italy into the war at a time calculated to bring her "in on the kill" greatly broadened the area of the war. Italy's African territory was extensive—Libya in Africa and Italian East Africa, consisting of Eritrea, Italian Somaliland, and Ethiopia. Across the Adriatic was her subject kingdom of Albania. Between them lay the Mediterranean, where Italy menaced also the "lifeline" of the British Empire, the route by Suez to India. Italy hoped to make the Mediterranean an "Italian lake" and to increase her African possessions at the expense of the British and the French.

Italy brought to the Axis battle line an army of perhaps 1,500,000, including native troops, and varying greatly in quality. She had about 3000 available planes. Her navy was weak in capital ships but strong in smaller craft. Her natural resources were limited.

Italy gained some initial successes in Somaliland but the British soon came back. An imperial force, partly South African, took the coast colonies and brought back Haile Selassie to Ethiopia. The main Italian army surrendered on May 19, 1941; the last remaining force, in November.

The war in North Africa showed a series of alternations of fortune. In September 1940, Marshal Graziani with 280,000 troops pushed 70 miles into Egypt. Egypt did not declare war, leaving its defense to the British. In December, the British general, Sir Archibald Wavell, attacked the Italians with 100,000 men, mainly Australians and New Zealanders, and by February 1941 had taken over 100,000 prisoners, occupied all Cyrenaica, and completely destroyed the Italian army as a fighting force.

A large part of the British force was now withdrawn to aid in the defense of Greece. In consequence the British were forced back to their Egyptian bases by the German General Rommel, Graziani's successor, but they still held the fortified port of Tobruk. Receiving reinforcements, the British again advanced in November and drove the Italians, now strengthened by German tank troops, to the borders of Tripoli. After desultory fighting, Rommel, with some reinforcements, advanced again in May 1942, and by the middle of July had recaptured Tobruk, invaded Egypt, and was threatening the British base at Alexandria and the Suez canal. In this fighting, tanks, some of them American, played a great part, being well adapted to deal with the distances and the desert terrain.

In the Mediterranean the Italians for a time closed the Suez canal route to India, and bombed Malta, unsuccessfully. On the other hand the British severely damaged the Italian navy in engagements at Tarano and off Cape Matapan.

The Balkan War. On October 28, 1940, Italy suddenly attacked Greece, striking from Albania. To everyone's surprise the small Greek army, of 150,000 men, not only repulsed the Italians, but advanced into Albania.

In the spring of 1941 Germany turned her military power toward the Balkans. Her diplomacy already had prepared the way. Hungary and Rumania were now under German control, and Rumania had been forced to return much of her gains of 1919 to Hungary, Bulgaria, and Russia. King Carol had abdicated in September 1940, and a Fascist government took his place. On November 23, 1940, Rumania signed the Axis pact. Bulgaria did the same. Turkey remained neutral, signed non-aggression treaties with both sides, and refused to be drawn in by either. In Yugoslavia the pro-German regent, Prince Paul, on March 20, accepted the German "new order." On the 27th the Serbian party staged a revolution which put his nephew, King Peter, on the throne, and repudiated the treaty.

Yugoslavia had about 550,000 men, poorly organized and equipped. They were assisted by the Greeks, and by an English contingent of 60,000 from Africa. The German army of 550,000, massed in Bulgaria, struck east and south. On April 9, Saloniki was taken. On April 17, the main Yugoslav army, attacked from the east and north, surrendered. Belgrade was taken.

The Germans now advanced on the Anglo-Greek army defending the Greek peninsula. On the 24th the Greek army in the west, about 220,000 men, capitulated. From the 11th to the 24th Australians and New Zealanders successively defended positions on the lines of Mt. Olympus and Thermopylae, but the increasing German pressure made further resistance impossible. About 45,000 of the British forces were evacuated from Megara and other ports, abandoning large amounts of equipment. By May 1 the Germans had conquered Yugoslavia and Greece. In the last days of May, a German attack, conducted almost entirely by air-borne troops, conquered Crete. The British lost six naval vessels from air attacks while defending it and about half of their garrison of 27,000 men.

The Axis powers now controlled the Balkan peninsula, with the important exception of Turkey. They controlled also most of the islands and had secured a base for operations in the Middle East. Yugoslavia fell apart into its original elements, while Italy and Hungary took large areas. Bulgaria took parts of Macedonia and Thrace from Greece, Serbia received a puppet government at Belgrade, but many of the Serbs continued a resistance in the mountains which took on the character of organized warfare. This resistance increased in importance as the war went on.

It was at this time that the British and Free French seized Syria and Lebanon to forestall a German march to India. German intrigue in Iraq brought prompt repressive action by Britain. A year later, a similar situation in Iran led to joint Russian and British occupation of Teheran.

The position of Italy was unenviable. Germany had saved her in North Africa and in the Balkans, and her price was entire subordination. German troops and officials in large numbers moved in.

The Atlantic Charter. The triumph of German arms in southeastern Europe was followed by a pause in which the anti-Axis world breathlessly awaited hints of the direction in which new blows would fall. At this point the leaders of the two great English-speaking nations met to provide a statement of the principles about which all nations opposed to the "New Order" of the Axis might rally.

Framed by President Roosevelt and Premier Churchill at a meeting on naval vessels "somewhere in the Atlantic" in August 1941, the statement was given the name of the Atlantic Charter. It was a statement of post-war aims despite the fact that the United States was not formally at war.

The Charter contained eight points: (1) The United States and Great Britain seek no aggrandizement, territorial or other; (2) they desire no territorial changes except with the approval of the peoples concerned; (3) they pledge themselves to further self-determination and the restoration of self-government; (4) to secure to all, victors and vanquished, access on equal terms to trade and raw materials; (5) the fullest collaboration of all nations in the economic field; (6) after the destruction of "Nazi tyranny," a secure and lasting peace, with freedom from fear and want; (7) enabling all men to traverse the seas without hindrance; (8) to secure the abandonment of force, for which, pending the establishment of a wider system of general security, "the disarmament of aggressor nations is essential." At an Inter-Allied Conference in London, September 24, twelve governments pledged adherence to the Charter. The term United Nations was applied to the signatories.

The Russian War. The war took a new turn on June 22, 1941, when Hitler suddenly hurled the full force of his armies against Russia. Hitler alleged that Russia was treacherously preparing to attack him when engaged elsewhere.

Military experts gave Russia six weeks to last. Expert opinion, however, both German and other, has seldom so completely underestimated the power of a nation. Russia had used the two-year respite secured by the German treaty to speed the construction of a war machine comparable technically with that of Germany. She alone among German foes had a first-class tank and air force. The industrial development required to support a large-scale war had been speeded with an astonishing energy. The world assumed that Russia under a communistic government lacked efficiency; an earlier "purge" extending throughout the army had raised doubts as to the loyalty of the people to their rulers. When the cloud of secrecy partly lifted, it was found that the "fifth column" in Russia had been completely eliminated; not only the army but the civilian population was trained and keyed to fight with a tenacity which for the first time was to halt the German legions.

Germany put into the field against Russia an army of 160 divisions, perhaps 2,400,000 men, increased as the war went on. Besides these Hitler had, like Napoleon, contingents from his subject nations, Italians, Slovakians, Rumanians, and Magyars; and the Finnish army in the north. Russia, though not fully mobilized, could put 2,000,000 men into the field, later increased to 4,000,000.

The plan of the war was simple. An advance on a 2,000 mile front, from the Baltic to the Black Sea, with all the German military technique, met by a "defense in depth" along the same line, withdrawing as necessary to preserve their fighting forces, and leaving "scorched earth" behind them. The German objectives were Leningrad in the north, Kiev and Odessa in the south, and Moscow in the center.

On the outbreak of the war, Winston Churchill forestalled any attempt by Hitler to assume leadership of an anti-communist crusade by accepting Russia immediately as a full ally. President Roosevelt pledged all possible aid. On July 13 a formal treaty of alliance was concluded between Great Britain and Russia, succeeded a year later by a 20-year pact for military and economic cooperation, within the framework of the Atlantic Charter.

The Anglo-Russian treaty of 1942 was signed on May 28. It consisted of two parts, one relating to the war and the other to post-war relations.

Under Part I, each nation pledged full military aid to each other and promised to refuse to enter negotiations for a separate peace with Germany or any of her satellites in Europe.

Under Part II, both parties accepted the principles of the Atlantic Charter. Specifically they renounced territorial aggrandizement. They also promised non-interference with the internal affairs of other states and co-operation in seeking the

security and economic advancement of the two nations.

In the north the Germans attacked Leningrad from the south and west. The Finns, under General Mannerheim, retook Viborg and Karelia and threatened the city from the north. The siege of Leningrad, thus begun, lasted for 30 months.

The central armies under Marshal von Bock met with stubborn resistance from Marshal Timoshenko's forces. They took Smolensk July 16, and stopped there for a time.

In the South General Rundstedt's armies, with Magyar and Rumanian contingents, overran Bessarabia and Galicia; while one army group pressed along the Black Sea, another turned north toward Kiev. Odessa was passed by and left to the Rumanians; it fell on October 16. By the middle of August, the Russians were forced across the Dnieper, where they blew up the famous Dnepropetrovsk dam. Kiev fell in the last weeks of September. The southern German columns pressed on to the Crimea and the industrial region of the Donets basin, taking Kharkov on October 24 and Rostov on November 22. The Russians were "trading space for time." In spite of heavy losses, they kept their armies largely intact.

Meantime the struggle for Moscow, under Hitler's personal supervision, was renewed in the central sector. In October the Germans were within a hundred miles of the city on the north and south, and Stalin sent the government offices to Kuibeshev (Samara) on the Volga. Some German units approached within 37 miles of the city. Against the advice of his generals, Hitler ordered Moscow taken at any cost. A final assault was made in mid-November. It failed.

The Russian winter closed down. Unexpectedly the Russians attacked in the south, retaking Rostov and Kerch. The Russian armies advanced farther north also but were unable to take any of the numerous fortified "hedgehog" points on which the German army relied for defense.

Russia in 1942; Stalingrad. In the spring of 1942, the Germans, paying less attention to Leningrad and Moscow, concentrated their forces in the south. Their general aim was to gain the manufacturing and food-producing districts of southern Russia and to destroy the Russian armies. Their specific objective was threefold: to reach the Volga and cut the north and south lines of communication by rail and river; to acquire the oil wells of the Caucasus; and by holding the northern Caucasus to cut off the supplies which were reaching the Russians by the Persian Gulf.

With about two million men at his disposal, Marshal von Bock moved into the lower Don valley. He occupied the Donetz basin, but the Russians under Timoschenko avoided encirclement. Rostov was retaken on July 24, and the way was open southwest to the Caucasus and northwest to the Volga. The advance into the Caucasus reached the seaport of Novorossisk and the Maikop oil fields. Driving through the northern foothills of the Caucasus, the Germans reached Mozdok on August 24. But the Russians held them back from the more important Grozny and Baku oil fields, and winter stopped further advance.

The northern drive reached Stalingrad, a leading industrial city on the west bank of the Volga, and began its attack on August 31. For four months the siege continued. Stalingrad was bombed by planes and heavy artillery into a rubbish heap, in which Germans and Russians fought from ruined house to ruined house. It was estimated that the Russians lost 6000 men each day but they took 2000 Germans with them. Reinforcements from the eastern provinces crossed the Volga under fire.

In late November, the Russians struck back and inflicted on Germany a major disaster which marked the turning point of the Russian war. Two flanking movements across the Volga to north and south cut the German supply lines. The Germans were forced to abandon the army besieging Stalingrad. In January 1943, the Russians claimed the destruction or capture of 22 divisions, 330,000 troops, with their commanding generals.

Japan and the Far East. When the war broke out in 1939, Japan had for two years been engaged in an undeclared war with China. She was meeting stubborn resistance from General Chiang Kai-shek's forces in western China and from guerilla bands in the east. Great Britain and the United States were unofficially supporting General Chiang Kai-shek and the Chungking government, whose chief line of supply was the Burma Road from Rangoon.

In the European war, Japan, ruled by its military class, was in natural sympathy with the Axis powers. On September 27, 1940, she signed a defensive treaty with Germany and Italy, under which each of these powers would come to the assistance of any one of their number attacked by a third power not already at war with it. It was obviously aimed at the United States.

With the fall of France Japan seized her opportunity to get control of French Indo-China. She was now in position to menace the American Philippines and the British possessions in Malaya, as well as the Netherlands Indies to the south. Her move fitted into a policy pursued since 1930, when Manchuria was invaded, the ultimate objectives of which involved establishment of a "New Order" in Eastern Asia.

With Great Britain in a death-grapple in Europe, opposition to Japan fell to the United States. Both sides professed a desire for peace and continued negotiations up to and beyond the moment when war began. But peace could endure only if one or the other side abandoned its objective—the "New Order" on the side of Japan and an "open door" economic policy for other nations on the part of the United States.

On November 26, 1941, Secretary of State Hull gave Japan a final and definite statement of the American position. Hull proposed: a multilateral pact guaranteeing non-aggression in eastern Asia; that Japan should withdraw her troops from French Indo-China; that she should cease her opposition to the Chungking government in China. In return he offered a reciprocal trade agreement and the removal of the "freezing" restrictions on Japanese credit. On Sunday afternoon, December 7, the Japanese envoys handed to Secretary Hull a memorandum charging the United States and Great Britain with "imperialistic exploitation" in that region and with maliciously opposing Japan's efforts for peace and order. The memorandum proposed that the United States, in agreement with Japan, should send no more forces into the western Pacific, restore commercial relations as before the "freezing," supply Japan with oil, and cease support of China. When these things were done, Japan agreed to withdraw its forces from Indo-China.

As the Japanese envoys were presenting the memorandum, news arrived that a Japanese air force, which must have taken weeks in preparation, had attacked the American naval base at Pearl Harbor.

America at War. Up to this point, American opinion on entering the war had been divided. The attack on Pearl Harbor instantly brought about the closing of ranks in preparation for what was recognized as a life-and-death struggle.

On President Roosevelt's recommendation, Congress declared war on Japan the next day, December 8. Japan's Axis partners, Germany and Italy, declared war on the United States December 11, and Congress at once reciprocated. At a Congress which met at Rio de Janeiro January 15, 1942, all Latin-American nations suspended diplomatic relations with the Axis powers except Argentina and Chile. Nine countries, the Central American and island republics, had already declared war. Hungary and Bulgaria declared war on the United States, December 13; in July 1942, the United States declared war on Hungary, Bulgaria, and Rumania.

Premier Churchill promised that, in the event of an American declaration, Britain would follow. Her declaration slightly preceded that by the United States.

Britain had sufficient reason, for Japan had simultaneously attacked Hong Kong and moved into Thai. Thai capitulated at once, and the Japanese entered Malaya. At the same moment Japan struck at the Philippines, where for six years General Douglas MacArthur had been training the Filipino army. With command of the sea and air and superior equipment, the trained Japanese forces landed on Luzon and pushed toward Manila, resisted but not stopped by the island forces. MacArthur abandoned Manila December 27 and declared it an open city, concentrating his troops in Bataan peninsula, across Manila Bay. The Japanese nevertheless bombed Manila. MacArthur's Americans and Filipinos held out in Bataan, keeping Japanese forces estimated at 300,000 fully occupied, until April 8, 1942, when what were left of Bataan's 36,000 defenders surrendered. Corregidor fortress was taken May 5, and Japan held the Philippines. Before the surrender of Bataan, General MacArthur had been ordered to Australia to take command in the western Pacific. General Jonathan M. Wainwright succeeded him, and conducted the defense until he was forced to surrender.

The attack on Pearl Harbor gave the Japanese temporary control of the Pacific. Five American battleships were sunk or put out of action, 3 battleships, 3 cruisers, and 8 other vessels were damaged, and 240 planes were destroyed; airfields were wrecked; about 3000 were killed and wounded. For the moment it was impossible to maintain American outposts against the Japanese; Guam was taken at once; Wake three weeks later, after considerable damage to the attacking fleet; Midway held out. Japanese submarines appeared on the west coast, but did no serious damage. On February 1, an American task force inflicted heavy damage on the Japanese bases in the Gilbert and Marshall islands.

Meanwhile the Japanese armies had been victorious on the Asiatic mainland. Hong Kong fell on Christmas Day. The Japanese were already attacking Malaya, and the British slowly retreated southward toward Singapore. The battleship *Prince of Wales* and the battle cruiser *Repulse*, recently sent to aid in its defense, were sunk December 10 by Japanese torpedo bombers. Singapore had been made impregnable from the sea, but not from the land side. It fell February 17.

The conquest of the Malay peninsula gave the Japanese the world's chief source of tin, one of the two chief sources of rubber, and the greatest British naval base in the Far East, on which all Allied plans for Pacific warfare had centered.

Already Japanese sea and air forces had been raiding the East Indies. Before the fall of Singapore, they had occupied Sarawak, in Borneo, had a footing in Celebes, had taken the Amboina naval base, and were attacking Sumatra. The small Dutch army and navy with the American Asiatic squadron and a few British ships resisted bravely. In a week of fighting in Macassar Strait at the end of January Dutch and American sea and air forces sank nearly half of a large Japanese fleet, but Java was occupied three weeks after the fall of Singapore, and the American-Dutch fleet was destroyed in a battle in the Java sea.

With the Dutch East Indies in their hands, the Japanese now controlled the second major source of rubber. By occupying the oil fields they cut off the Allies from their nearest supply of oil.

Australia was now faced with the danger which had been its nightmare for 60 years. The Commonwealth had already made preparations, but the arrival of an American expeditionary force was welcome. The Japanese had taken Rabaul in New Britain in January and had occupied positions in the Solomon islands. They had made landings in New Guinea and were bombing Port Moresby in that island and Darwin in Australia. In April they began concentrations at their bases. On May 4 their fleet, moving south in the Coral Sea, met the American fleet, which had been watching them. The battle which followed set a precedent in naval warfare in that the contending ships never saw nor fired on one another; it was a battle of aircraft. In the next four days the Japanese lost 2 aircraft carriers, 7 cruisers, and 5 destroyers, sunk or damaged, with other vessels, 23 in all. The Americans lost the carrier *Lexington* and two smaller ships.

The Japanese had turned north upon Burma, not only to occupy it, but to cut the Burma Road, the supply line of China. In spite of desperate British resistance, they reached Lashio, its southern terminus, at the beginning of May. By early June, when the rains stopped further progress, they were threatening Assam. Beyond Assam lay India, where the demands of Gandhi and the Indian Native Congress for immediate independence were hampering British defense.

The Japanese check in the Coral Sea may have contributed to greater activity in the North Pacific. On April 17 American carrier-based aircraft—from "Shangri-La," President Roosevelt explained,—dropped bombs on Tokyo and Yokohama. Admiral Nimitz, expecting some Japanese attack, had centered his defense on Midway Island. On June 3 patrol planes picked up a Japanese force of about 80 vessels, including transports, heading toward the island. Their purpose appeared to be an attack on Midway or possibly on Pearl Harbor itself. An American carrier force farther north was notified and hastened to the scene. Meantime the land based airplanes from Midway attacked and inflicted considerable damage. Carrier-based planes from the Japanese fleet bombed Midway; the damage, though serious, was not disabling. As the Japanese turned to retreat the next morning, the American carrier fleet came up and pursued them. In a three-days running fight, again entirely by airplanes, four Japanese carriers and two heavy cruisers were sunk; three battleships and ten other vessels were sunk or damaged. The American carrier *Yorktown*, and one American destroyer were sunk, the latter by a submarine. The American loss was 92 officers and 215 men. Japanese casualties were estimated at 4800.

The battle of Midway Island was the turning point in the Pacific war. Thereafter the initiative was in the hands of the United Nations.

The Invasion of Africa. The late summer of 1942 marked the height of Axis success. The Germans had driven the Russians back to the Volga and entered the Caucasus; in Africa, Rommel was threatening the British hold on Egypt; Japanese conquests had reached Burma and New Guinea and threatened India and Australia. Against this could only be set the damage by Allied air raids, the improvement in the submarine situation, and the growth of production in the United States. With the autumn of 1942 the scales began to tip in favor of the Allies.

Toward midnight on November 7, radios announced that American and British forces had successfully invaded northwest Africa. A fleet of 850 ships under British naval escort at 1 A.M. on November 8 had landed American and British battalions near Oran and Algiers; a few hours later other American forces, moving directly across the Atlantic, reached Casablanca, in Morocco. At dawn, parachute troops flown directly from England landed and siezed the airfields. There was little resistance, most vigorous at Casablanca. Algiers surrendered on the evening of the 8th, Oran the next day, and Casablanca on the 11th. The Americans had less than 2000 casualties. Sixteen ships were sunk, including five transports, but most of the men were rescued. The expedition was directed by Lieutenant-General Dwight D. Eisenhower.

In four days the Allies had gained possession of all French North Africa except Tunisia. The operation presented a political as well as a military problem. It happened that Admiral Jean Francois Darlan, commander of all French forces and Pétain's designated successor in the Vichy government of France,

was in Algiers at the time of the invasion. Darlan, after negotiations with General Eisenhower, on November 11 ordered the French troops to cease firing and proclaimed a provisional government for North Africa aligned with the United Nations with himself as chief of state. French West Africa, including the important port of Dakar, accepted the new regime. The recognition of Darlan, whom the Free French regarded as dyed in the treasonable colors of Vichy, excited alarm among those who feared compromise with the Nazis. The plan was said to be temporary and was adopted to save lives and time.

The problem was somewhat simplified when, on Christmas eve, Darlan was assassinated by a young French national. Darlan's recently organized imperial council chose General Henri Giraud, who had made good his escape from France with American aid, as high commissioner and commander in chief.

De Gaulle controlled most of the rest of the French empire. To achieve a measure of unity, he was accepted as co-chairman with Giraud in a committee of national liberation, which superseded the imperial council. Soon eclipsing Giraud, De Gaulle purged the administration of pro-Vichy elements and became the recognized French leader.

Repercussions in France. The Allied seizure of North Africa was answered by Hitler's cancellation of the armistice with France and the sending of German troops into the unoccupied section. Pétain disavowed Darlan's action and removed him from office. On November 17, he transferred his powers to Hitler's tool, Laval.

Meanwhile most of the French fleet lay at the great naval base of Toulon, immobilized under the armistice. On the morning of November 27, the Germans sent troops to seize them. The commanders, under orders of their admiral, at once proceeded to scuttle the ships while French troops on guard kept off the Germans. About nine-tenths of the fleet was destroyed. A few submarines escaped to Africa.

With Morocco and Algeria secured, a race began for Tunisia. This race the Allies lost. In spite of the efforts of sea and air forces, the Germans under General von Arnim poured men and munitions across the narrow straits from Sicily into Tunis and the naval base of Bizerta, overwhelmed the French garrisons there, and occupied the coastal plain behind the ports of Sfax and Gabes.

Montgomery and Rommel. Meantime, at the other corner of the Mediterranean, the British Eighth army, now commanded by General Sir Bernard Montgomery, faced Rommel's Germans and Italians at El Alamein between the sea and the soft sands of the Qattara depression. Montgomery had been reinforced to 200,000 men, with 1000 tanks and other munitions. Rommel also received reinforcements and had about 140,000 men and 500 tanks.

Montgomery moved first. On October 22, the British artillery began blasting a way through the opposing lines. Two weeks later Rommel's forces were in full retreat. Tanks were half the battle in this desert warfare, and Rommel lost half of his, besides 600 planes and 9000 prisoners. The mechanized German force retreated along the coast road, abandoning several divisions of Italian troops, who surrendered gladly. Tobruk was retaken on November 13. On the 20th, Rommel gave up Benghazi. He had now lost 75,000 men. With the German Afrika Corps, he made a stand at El Agheila, 560 miles west of his initial position.

El Agheila, on the border of Tripolitania, had been the limit of previous British advances. For three weeks Montgomery reorganized his transport and brought up supplies. Then, on December 13, he struck again, and two days later Rommel was again in retreat. Tripoli was abandoned January 23. Rommel, with about half his original force, made his final stand on the Mareth line, the border fortifications of Tunisia. He had conducted a masterly retreat of 1500 miles from his position in Egypt. He had left about half of his original force. His purpose was now to support General von Arnim's forces in Tunisia.

Tunisia. Tunisia is an irregular quadrilateral, washed on the north and east by the Mediterranean. The northwestern part is mountainous, one ridge running out into the promontory of Cape Bon. In the southeast is a broad coastal plain. The important military objectives were Tunis and Bizerta on the north coast, held by the Germans, who held also the coastal plains and the coast towns.

The Allied forces held a generally north and south line in western Tunisia. On February 24 the Germans struck in the south at the Americans holding the Kasserine Pass. Inexperienced and outnumbered, the Americans were driven back about 28 miles but recovered the lost ground by the beginning of March. On March 20, the Eighth army launched an attack on the Mareth line, while the Americans and British to the north increased their pressure. A New Zealand corps under Montgomery's command outflanked the Mareth line. On April 7 American patrols made contact with units of the Eighth army. Under the combined attack Rommel was forced to retreat north nearly to Cape Bon.

From the beginning of the movement the sea and air forces of the Allies had been watching and attacking the Axis transport. On April 5 a smashing attack on the aerodromes of Sicily and Italy crippled the Axis air force, and continuous bombing cut their communications with Sicily. A combined assault by the ground forces followed. The Axis line was broken by a tank attack. On the 7th the Americans entered Bizerta, and the British entered Tunis at almost the same time. A part of the enemy, trapped between them, surrendered on May 9. The remainder were driven into the Cape Bon peninsula and surrendered the next day. The captured troops numbered some 252,000, besides large quantities of equipment. They included General von Arnim but not General Rommel, who had been previously ordered to Italy to direct the defense there.

By this campaign the German plan to join forces with Japan by taking the Suez canal was ruined. In its place, a line of attack on southern Europe was opened up for the Allies. The route to the Japanese war by the Suez canal was now open to the Allies.

The Collapse of Italy. The Allied army was now poised on the tip of Africa, ready to strike at "Fortress Europe." The air forces began the work by bombarding the fortified islands between Africa and Italy and the supply bases in Italy itself. On the morning of July 10 a fleet of 2000 vessels of all sizes landed 150,000 British, Americans, and Canadians on the south and east coasts of Sicily. There was very little resistance, for the enemy had expected them in the west of the island, and clouds of parachute troops the night before had seized the principal airfields.

Sicily is, for the most part, a mass of mountains culminating in Mt. Etna at the northeast corner. There the narrow strait of Messina separates it from Italy. The British Eighth army moved up the east coast, took Syracuse, and, on the 19th, was stopped at Catania just south of Mt. Etna by stiff German resistance. The Canadians moved forward in the center. The American Seventh army, under command of General George Patton, was nearer the region where the defenders were prepared and met more opposition at first. From Agrigento (Girgenti) it advanced inland. Americans and Canadians reached Enna, in the center of the island, on the 21st, and resistance in the west practically ceased. The Americans pushed through to the north coast, taking 100,000 prisoners and much undamaged war material. They had throughout overwhelming air support. The Germans fought stubbornly, but the Italians were more willing to surrender. From Palermo the Americans turned east to outflank the German position at Catania. By the end of the month the whole enemy force was crowded into the northeastern corner of the island between Mt. Etna and the sea. On August 5 the British took Catania, on the 17th resistance ceased in Messina, and Sicily was conquered. Some of the garrison escaped, but about 200,000 were captured.

The losses in Sicily brought about a revolution at Rome. On July 25 King Victor Emmanuel requested Mussolini's resignation and appointed Marshal Badoglio premier. The new government soon began secret negotiations with the Allies. After an attempt to make terms, the Badoglio government surrendered unconditionally September 8, handing over most of the fleet. About the same time, Mussolini, who had been taken into custody by the new government but rescued by a daring German raid and taken to northern Italy, was set up by the Germans as a puppet ruler. Italian liberals, meanwhile, led by Count Carlo Sforza and Benedetto Croce, demanded that the king abdicate in favor of his young grandson. The Allies recognized the Badoglio government, which declared war on Germany October 13. The king and Badoglio were safe behind the Allied lines.

Mussolini's retirement had taken everyone by surprise—including the Allies. The Germans rushed 19 divisions into northern Italy and proceeded to strengthen their position there and at Rome despite Italian opposition. They had two powerful advantages: Most of the Italian army was in garrisons under control of the Germans; and 200,000 Italians, laboring in Germany, were hostages. As the king and Badoglio played for time, the Allies acted. On September 3, the British Eighth Army landed in Calabria and advanced with little opposition. On the 8th, the American Fifth Army under Lieutenant General Mark Clark landed near Naples. It was vigorously opposed by German forces in readiness to meet the landing and escaped disaster at the Salerno beachhead only by concentration of all available air and sea support. Meantime the British took Bari and the important airfields of Foggia. Their left made contact with the Americans on the 17th, and the advance up the peninsula continued. On the 30th the Americans entered Naples.

The Germans were now in complete control of northern and central Italy, and the beginning of 1944 found them struggling fiercely with the Allies on the so-called Gustav line extending across the peninsula from Piscara to Cassino. On January 22 a surprise landing by the Fifth Army within a few miles of Rome threatened the entire German army south of that point. Skilful German defense in a rugged terrain, however, delayed the fall of Rome for nearly six months.

The Gustav line was finally broken and on June 5 the Allies entered Rome. A repetition of the German tactics of delay, taking every advantage of favorable terrain, slowed down the Allied advance again. By the end of the year, the Allies, reinforced by French and Brazilian contingents, had taken Florence and Pisa, but were still struggling on the southern edge of the Po valley. Italy was now becoming, however, a secondary theater, mainly important for its effect on greater operations elsewhere.

Russian Victories of 1943. In the campaign of 1943, the Russians drove the German army from the Volga to the former Russian boundary, recovering over 300,000 square miles of territory.

Russian successes began with the encirclement and destruction of the German armies besieging Stalingrad. This success was followed by new offensives which retook Rostov and Kharkov in February. The Germans saved their men, however, and a month later retook Kharkov. The Germans in the Caucasus were cut off.

To the west of Moscow the Russians had taken Velikye Luki in December, and were breaking into a German salient at Rzhev. Farther north they partially relieved Leningrad in January, but the Germans still clung to their positions within artillery range of the city. The Russians claimed that the Germans, in the winter campaign, had lost 850,000 men killed and wounded, and 344,000 prisoners.

The Germans started their last offensive in July. It was soon stopped, and they began a slow withdrawal, closely followed by the Russians, but the skill of the German "strategic retirement" prevented heavy losses. The Russians now retook Kharkov—its fourth change of hands—and recovered the Donets basin. By October they had retaken the Caucasus, and were entering the Crimea.

The Germans may have expected to hold the line of the Dnieper, but did not succeed. The Dneprope-trovsk dam was recovered. Kiev was taken November 7. Before the end of the year the Russians were across the Dnieper in many places, aiming for the vital Odessa-Warsaw railway.

In the center, advancing from Moscow, they took Smolensk, and had reached the old Polish border in January. In the north Leningrad was completely freed and Novgorod retaken.

While carrying out this sustained and gigantic offensive, Stalin planned sagaciously for the future. A 20-year treaty was signed with the friendly government-in-exile of Czechoslovakia. Grounds for suspicion in the West were weakened by dissolution of the Comintern and by recognition of the Greek Orthodox Church. Stalin, however, refused to recognize the unfriendly Polish government-in-exile located at London and made clear Russia's intention to keep territory which Poland took from Russia in 1920.

The Ukraine Recovered. The Russian activity now centered in the Ukraine. The Germans on the lower Dnieper were encircled, and some ten divisions, over 100,000 men were taken. Kherson, on the Black Sea, surrendered. The Russians passed the Dniester, and the boundary river Pruth. By the end of March they were attacking Czernowitz (Cernăuti) in Rumania. Odessa was retaken on April 10, and Sevastopol a month later. The Russians announced that in the spring campaign the Red army had liberated 16,000 square miles of territory, and had killed or captured 500,000 of the enemy.

Poland and the Satellites. As the ground dried and military operations became possible, the Russians were again in motion. By July the Germans were pushed back to Minsk and the Polish border. In central Poland the Red army reached the Vistula in mid-July and attacked Warsaw, but there the advance was halted. In August an insurrection of the Polish underground broke out in Warsaw and held a part of the city for several weeks, but the Russians gave no assistance, and the Poles were forced to surrender. The Russians asserted that the uprising was premature and uncoordinated with Russian plans; the Poles charged betrayal.

For the time the main Russian effort was directed to the south. Lwow (Lemberg) was taken on August 17. On August 22 the Russians took Jassy, and the next day Rumania asked for an armistice, surrendered, and two days later declared war on Germany. The Russians nevertheless advanced across Rumania, occupied Bucharest, the Ploesti oil fields, and Constanta and the Black Sea coast. It was now Bulgaria's turn. Bulgaria had maintained a formal peace with Russia, but now Russia declared war on Bulgaria, entered the country on September 8, and occupied Sofia five days later. Bulgaria made peace with Russia, and declared war on Germany, opening the way to Yugoslavia and Greece. The German forces in these countries withdrew as best they could. Marshal Tito and the Partisans in Yugoslavia joined forces with the Red army. They entered Belgrade on October 14. Greece was liberated by the British, who had been landing forces since September and had pushed north with almost no resistance. By November Greece was free.

Red armies were already pressing forward in other quarters. They passed the prewar boundary of Hungary early in October. Admiral Horthy asked for an armistice, and the Germans took possession of the country. The Russian advance drove the Germans back beyond the Tisza and Lake Balaton and began the siege of Budapest, which fell in early 1945, while other Russian forces were entering Slovakia. In the north, the Baltic provinces were also falling. In July and August Lithuania had been conquered. By the end of September Estonia was cleared, and the Russians were in Riga and attacking East Prussia. Fin-

land was forced to agree to terms, returning to the boundaries of 1940. The Germans in Finland retired to northern Norway. The Red army followed and the Germans gave up Finnmark, laying waste the country as they retreated.

The Invasion of France. The part taken by Russia in the war led to repeated intimations from Russia and demands in Britain and the United States for the opening of a "second front" in order to deliver the decisive blow of the war. At the beginning of 1944, preparations were in progress for such an invasion, the nature and magnitude of which were unprecedented in the history of warfare.

Meanwhile the aerial offensive from British bases against Germany and the occupied countries rose to a terrible crescendo. The Ruhr valley was wrecked. A raid on Cologne in May 1942 in which 1130 planes took part was called the greatest air raid in history, but it was surpassed by later attacks which demolished Hamburg, a large part of Berlin, and numerous other cities. The Rumanian oil fields and Sofia, in Bulgaria, were likewise visited. Skilfully directed air assault on German aircraft factories in February 1944 was credited with so crippling German air power that Allied supremacy in the skies was never seriously challenged thereafter.

Among pre-invasion devices experimented with was the commando raid, undertaken by small parties which did the greatest possible damage to a definite objective and retreated with what information they could acquire about defenses. The most elaborate of these was the raid on Dieppe, August 19, 1942. It was carried out by 5000 Canadians with British, American, and French contingents, 10,000 in all. The Canadians lost 67 per cent of their men. The experiment was not repeated.

The most serious obstacle to invasion at first was the submarine, but by mid-1943 it was definitely eliminated as a factor. In 1942, about 7,000,000 tons of Allied shipping were sunk. In late 1943 almost as many German submarines as Allied ships were sent to the bottom. Moreover, Allied shipping was growing at the rate of more than half a dozen ships a day.

In preparation for the attack on "Fortress Europe," General Dwight D. Eisenhower was appointed Supreme Allied Commander in Western Europe. General Sir Bernard L. Montgomery commanded the British ground forces; Lieutenant General Omar P. Bradley, the American; Admiral Sir Bertram Ramsay was naval commander. To oppose them the Germans had assigned command to Field Marshal Rommel and General von Kluge.

Meanwhile the Germans on their side were preparing new secret weapons, the most formidable of which was the robot bomb, propelled from a ramp to travel great distances and fall with terrific explosive force. In the months immediately after the invasion of Europe began, London suffered damage or destruction of a large proportion of its buildings through this weapon.

On "D-Day," June 6, 1944, the Anglo-American expeditionary force struck the French coast in the most gigantic amphibious operations ever undertaken. Supporting 3200 transports and landing craft were 800 fighting ships. Some 8000 Allied planes held control of the air. Three divisions of airborne troops preceded the landing craft and held off the enemy; the warships shelled the shore fortifications. The Americans landed at the foot of the Cotentin peninsula, while the British struck farther west toward Caen, holding between them some 30 miles of the Normandy beaches. Initial losses were heavy enough, but less than had been expected. Within a week the beachheads were secure against counterattack. Then the Americans turned against Cherbourg, while the British around Caen protected their flank. Cherbourg was taken by the end of June, and its port facilities were soon available.

Three weeks of "hedgerow war" followed; the British holding off the Germans around Caen, the Americans struggling inland, until the capture of St. Lo on July 18 placed them in position for a breakthrough. Another American army, the Third, commanded by Lieutenant General George S. Patton, was now in operation. Its armor overran Brittany, then, turning, swept east across France through Tours and Orleans. Paris was entered on August 25. The German Seventh Army attempted a counterattack but was driven, wholly disorganized, across the Seine. The British and Canadians followed them eastward along the coast. In the first days of September they crossed Belgium and entered the Netherlands, taking Antwerp and Breda. The Americans swung north to western Belgium and Luxembourg. In late September a daring attempt by parachute troops to secure a position at Arnheim, beyond the lower Rhine, was unsuccessful, but the Americans took Aachen in October against desperate resistance.

Meantime another American force had made a landing, August 15, on the southern coast of France between Nice and Cannes. Taking Marseilles and Toulon, they pushed up the Rhone valley, meeting little resistance. The French "Forces of the Interior," whose time had now come, rose all over France. A part of the German army of occupation escaped through the Gap of Belfort; more surrendered. The American and French armies, crossing the Vosges mountains at Belfort, joined the northern armies on the Rhine. By the end of October France and Belgium were liberated. The Germans had suffered a terrible but not yet fatal disaster. Over 800,000 of their troops had passed into Allied prison camps.

Anglo-American Assault on Germany. Steady Allied advances into the deep defenses of the Siegfried line were interrupted in December 1944 by a strong German counterattack into Belgium and Luxembourg. Massing three armies in this area and favored by weather conditions which kept down the stronger American air force, the Germans drove through the Ardennes 50 miles into Belgium. General Eisenhower concentrated his defenses at the northern and southern flanks. The heroic resistance of an American division at Bastogne and prompt counterattacks from north and south brought the Germans to a halt. They were forced back to their original lines and beyond. The "Battle of the Bulge," while costing the Allies 40,000 casualties, was estimated to have brought the Germans losses of several times this number.

The Allied pressure against the German lines culminated in several breakthroughs in late February 1945, and the German army was soon in full retreat beyond the Rhine, destroying bridges as they retired. The Americans entered Cologne on March 7; the next day, seizing a bridge at Remagen before it could be destroyed, they began to pour troops across the river for an advance into central Germany.

The War in the Pacific. The Japanese drive in the summer of 1942 had carried them to the Solomon Islands and New Guinea. Both positions threatened Australia. In the easternmost islands of the Solomon group, the fine harbor of Tulagi, with an airfield on the neighboring island of Guadalcanal, offered a base for attacks on New Caledonia and the supply line from the United States. Behind and supporting both was the air and naval base under construction at Rabaul on New Britain. One thousand miles to the north was Japan's "Pearl Harbor," Truk.

The first Japanese attack was on Port Moresby in southern New Guinea. In July, the Japanese made a landing at Buna, farther down the coast. Two attempts to take Port Moresby failed.

In August the American and Australian navies took the offensive and attacked the Japanese positions in the eastern Solomons. Tulagi was taken and held. American marines landed on Guadalcanal August 7 and seized the almost completed airfield. Around this airfield, renamed Henderson Field, American and Japanese were locked for months in the most crucial struggle of the campaign, the final outcome of which was destined to be decided by the naval and aerial conflict.

On the night of August 8, a Japanese air force attacked the Allied fleet and sank four heavy cruisers—the American *Quincy*, *Astoria*, and *Vincennes*, and the Australian *Canberra*, but did not reach the transports. In October, November, and December, the Japanese renewed their attacks, first to reinforce their men and, as the great battle gradually turned against them, to evacuate their troops. In October, Vice Admiral William F. Halsey was placed in command of the operations. In a final Japanese assault in November, officially called the battle of Guadalcanal, the Japanese lost two battleships, four cruisers, six destroyers, and eight transports with other vessels, 28 in all, and an estimated 40,000 men. Allied losses were two cruisers and seven destroyers. By January 1943, the fighting around Guadalcanal was practically over. The Americans renewed their offensive, slowly drove the Japanese from the middle Solomons, and at the beginning of 1944 had made lodgments on New Britain and were closing in on the principal base at Rabaul.

On January 31, 1944, the Americans struck Japan's Marshall islands. Within a few days this outpost of the Japanese Empire was taken. The Gilbert islands had already been occupied in November 1943 in a swift but costly three-day assault.

Meantime General MacArthur was taking personal charge of the offensive on the northern coast of New Guinea. Buna and Gona were taken in December 1942. In March 1943, a Japanese transport fleet attempting to reinforce Lae, was caught by land-based aircraft in the Bismarck sea. All twelve transports and their escort were sunk, with an estimated loss of 40,000 men. In September Salamaua and Lae were captured, and the Japanese were driven from eastern New Guinea.

In the Aleutians, the Japanese had made lodgments on Attu and Kiska islands after the battle of Midway. In May Attu was taken. Kiska was later evacuated, and the Aleutians were clear.

"Island Hopping" Stage. With the Gilbert and Marshall islands and eastern New Guinea in their hands, the American forces in the Pacific moved westward on two lines, converging on the Philippines. General MacArthur's Southwest Pacific command worked along the coast of New Guinea. Admiral Nimitz and the fleet continued their conquest of Micronesia. Sea, land, and air forces co-operated.

By such means the American and Australian forces, with assistance from the fleet, took Hollandia and later Biak island in New Guinea. By August, MacArthur was at the tip of the island, and the Japanese left behind were negligible. In September he occupied Morotai and neutralized Halmahira in the sea between New Guinea and the Philippines.

Meanwhile the fleet had been moving westward. The Carolines, with the fabulously strong base at Truk, was the next objective. Truk was repeatedly bombed until it was temporarily harmless. Halsey's Third fleet assisted MacArthur's advance and carried out carrier-based bombing raids as far as Luzon.

On June 14, 1944, marines were put ashore in the Marianas within range of Japan itself. The danger brought out a Japanese naval force, which was defeated with heavy loss by Admiral Spruance. Saipan resisted for several weeks; in August the recapture of near-by Guam was announced. The Palau islands were taken in September. Admiral Halsey extended his activities to Formosa and the Ryukyu islands, but the Japanese fleet avoided an action.

Return to the Philippines. The way was now clear for the invasion of the Philippines. General MacArthur, with 600 ships and 250,000 men, landed on Leyte island, in the middle of the group, on October 17. The initial resistance was slight, but apparently the Japanese determined to make their fight for the Philippines there, for reinforcements were sent—not all of them arrived—and three Japanese task forces converged on Leyte October 25 to destroy the American transports. The Third and Seventh fleets met them off the eastern coast in the Second Battle of the Philippine Sea. One task force was destroyed, the others were driven off with 24 vessels sunk, including at least three battleships and four carriers, and 33 others damaged. The American loss was one carrier and five smaller ships. Fighting in Leyte continued into December. Meanwhile the Americans occupied near-by Samar and Mindoro.

The occupation of Mindoro cleared the way to Luzon. In early January 1945, a fleet of 800 ships steamed through the Sulu sea and landed at the head of Lingayen Gulf, where the Japanese had landed three years before. A series of air raids upon Formosa prevented opposition from that quarter. The Japanese resistance was surprisingly light; on February 6 MacArthur entered Manila.

On the mainland the Japanese had better fortune. By occupying the line of the Peiping-Hankow railway, they cut Free China in two. On the other hand they lost ground in Burma, where the British entered Mandalay on March 8, 1945. About the same time a Chinese army took Lashio, the old terminus of the Burma road.

Earlier Conferences. As it became apparent that the unexpected power of Russian arms and the potentially crushing weight of American materials and forces spelled doom to Germany in a military sense, hope of escape turned to dividing the Allies. This hope was effectively cut off by inter-Allied conferences and agreements. January 14-24, 1943 Roosevelt and Churchill with their military advisers met at Casablanca, Morocco. "Complete agreement" was reached for the "intensive prosecution of the war in 1943."

Another conference, at Quebec, between Roosevelt, Churchill, and King, prime minister of Canada, August 20-24, was preceded by meetings of British and Canadian officials and followed by a visit of Churchill to Washington. T. V. Soong, Chinese foreign minister, also attended. Decisions were reached on military movements and the political issues.

Decisions of the highest importance were made by the Moscow conference, October 18-30, between the three secretaries, Hull, Eden, and Molotov.

Its communiqué recognized the importance of collaboration for carrying on the war, making peace after it, and determining the treatment of "Hitlerite Germany."

Russia naturally could not participate in conferences regarding the war with Japan. For this purpose President Roosevelt, Premier Churchill, and Generalissimo Chiang Kai-shek met at Cairo (November 22-26). They committed their nations to the restoration of Japanese conquests, including Formosa and Manchuria, and the future independence of Korea.

The fifth of these conferences followed almost immediately. It was signalized by the presence of Marshal Stalin, who at last met President Roosevelt and Premier Churchill at Tehran, Iran, November 28-December 1, 1943. Their declaration stated that they had "concerted their plans for the destruction of the German forces," and "no power on earth could prevent" Germany's overthrow.

Later Conferences and Postwar Plans. President Roosevelt and Premier Churchill met in a second conference at Quebec, September 11-16, 1944, dealing chiefly with questions relating to the war in the Pacific. A more important conference was held at Yalta, in the Crimea, February 4-11, 1945, where Marshal Stalin met the two Western leaders. At this conference, plans for the defeat, occupation, and control of Germany were settled. Preliminary plans were made for a world peace organization to be further considered by an assembly of the United Nations, called for April 25, 1945, at San Francisco.

Another class of conferences, of larger membership and limited scope, dealt with postwar problems. The International Monetary Conference, held at Bretton Woods, N. H., July 1-23, 1944, proposed the establishment of an international monetary fund and of an International Bank of Reconstruction and Development to stabilize currency, prevent infla-

tion, and promote reconstruction after the war. The International Security Conference, at Dumbarton Oaks, Washington, D. C., June 21-October 7, 1944, participated in by representatives of the United States, Great Britain, and Russia, and later China, formulated a plan for a world organization to preserve peace. The Pan-American Conference at Mexico City in March 1945 put forward a similar plan for the Americas, the Act of Chapultepec. An International Aviation Conference at Chicago January 1-5, 1945, agreed upon some features of the control of civil international aviation.

The Western Front. The American crossing of the Rhine at Remagen was inadequate, and led into a terrain where an advance could easily be contested. A successful advance could only be made over the Baltic plain. This was soon remedied. While General Hodges' First Army enlarged its bridgehead and threatened the Ruhr district, General Patton's Third Army drove down the Moselle valley to Coblenz; reaching it March 17, they trapped the German armies still east of the Rhine. Farther south the Seventh Army advanced toward Karlsruhe, pocketing the Germans in the Saar basin. In the north, Marshal Montgomery's British and Canadian armies forced a passage at Wesel on March 23, and drove north and northeast, the British toward Bremen and Hanover, the Canadians along the Dutch border, trapping the enemy forces who remained in Holland. The Germans were unable to hold the line of the Wesel against the British and American armies. Bremen and Hamburg were taken, the Allies pressed on to the Elbe, and by mid-April their advance had passed it, but was held back to avoid possible collision with the Russians. The Germans pocketed behind them in the Ruhr valley, upwards of 300,000, surrendered on April 19th.

While the British were overrunning the northern plain the American Third Army had reached the Main valley and entered Frankfort. The Seventh Army, crossing near Karlsruhe, approached Nuremberg, and the First French army entered Germany farther south. It was the part of the Third Army, noted for its rapidity of movement, to cut off southern Germany, and forestall the rumored intention of the Nazi leaders to retire into the mountains of Bavaria for a final stand. This was done by mid-April. The Third Army took Leipzig on the 19th, and pressed on into Czechoslovakia. Farther south the Seventh Army, with the French on their right flank, occupied the Bavarian cities, Nuremberg, Augsburg, and Munich (April 30). On April 26 Russian and American forces met at Torgau in Saxony.

Meantime the air forces were in constant action, assisting the ground forces and bombing industrial centers and communication lines. Berlin was continually under fire. The Germans retaliated with a new secret weapon, the V-2 rocket bomb, causing great damage in London and southern England.

The Final Russian Victory. On January 12, 1945, Stalin ordered a grand offensive, designed to destroy the German armies in the east. Beginning with a drive upon Krakow, it extended to East Prussia on the north, and Silesia on the south. Warsaw was taken in passing, and Poland overrun, as the Germans drew back to the Oder, their last line of defense. The southern column, crossing the Oder, attacked and surrounded Breslau, and deprived Germany of its industrial district of Silesia. The central column, under General Zhukov, drove through Poland toward Berlin. The Oder was crossed in force near Berlin, but before delivering its principal blow at the German capital, the Russian army secured its northern flank. By the beginning of March, the Russians had sliced up northeastern Germany. Konigsberg and Danzig resisted until April; Stettin, the seaport of Berlin, until April 27; and the Russians moved down the Baltic coast as far as Rostock.

In the south, the Red army, by the end of March, had cleared Hungary of the Germans, taken Bratislava in Slovakia, and were entering Austria. Vienna was attacked on April 6, and surrendered on the 13th. Farther north another army, passing around besieged Breslau, was entering Saxony to meet the Americans at Torgau.

Thus the stage was set for the climactic attack on Berlin itself. On April 15 the final drive began. The Soviet armies converged upon it from three sides. On the 25th, Berlin was completely surrounded. Foot by foot, Russian tanks and infantry fought their way into the doomed city, while from the housetops to the subways the garrison and armed citizens contested their advance. On May 2, the last resistance ended.

The End of Adolf Hitler. Adolf Hitler remained in Berlin to the last. On May 1, Grand Admiral Karl Doenitz announced over the Hamburg radio that the Fuehrer had fallen that afternoon. The exact circumstances of his death were not stated and later stories were conflicting but it is probable he committed suicide. Dr. Goebbels, propaganda minister, committed suicide at about the same time. Of the other Nazi leaders, Marshals Goring and Von Rundstedt were captured earlier by the Americans. Himmler, the hated chief of the police, was captured and committed suicide. Ribbentrop was arrested later. Admiral Doenitz announced that Hitler, a few days before, had designated him as his successor.

The Surrender of Germany. For the new Fuehrer nothing was left but surrender. While the German field armies continued to fight fiercely against the Russians, they seemed quite willing to surrender to the Anglo-American forces in the west. The army in Italy had signed articles of surrender on April 29. On May 4, Marshal Montgomery received the surrender of the German forces in the Netherlands, Denmark, and Northwest Germany. The next day, two German armies in Austria surrendered to General Devers. Admiral Doenitz accepted the situation. On May 7 his representatives surrendered to General Eisenhower, at his headquarters at Reims, the entire armed forces of the Reich. The surrender was formally announced on the morning of the 8th by President Truman and Premier Churchill. A few hours later the final articles of surrender to Russia were signed at Berlin by Marshal Zhukov and Marshal Keitel. So the European war officially ended, five years, eight months, and six days after the invasion of Poland.

The End in Italy. On April 10, the Allied armies, long stalled on the edge of the Po valley, launched their final offensive. Bologna, the primary objective, fell on the 21st, and resistance began to weaken as the allies pushed northward. Genoa and Milan fell to the Americans on the 29th, and Venice to the British. Realizing that the American advance in Germany left them no refuge there, and threatened by a flank attack from France, the German commanders opened negotiations for a surrender. The capitulation was signed at Naples on the 29th, becoming effective on May 2d, and northern Italy, with the adjacent Austrian territory, passed to the Allies.

Even before the surrender the end had come for Benito Mussolini. Attempting to escape to Switzerland, he was arrested by Italian partisans, given a "trial," and shot, at a village near Lake Como.

The Occupation of Germany. The Third Reich came to an end on May 23, when Admiral Doenitz and his officers, who had been carrying on an administration, under Allied supervision, were put under arrest. Germany was now without a government. In its place was military control by the Allies.

In pursuance of the arrangements made at Yalta, Germany was to be divided into four zones of military occupation. The Russians took charge of most of Germany beyond the Elbe. The Americans were to occupy southern Germany, with lines of communication through the British zone in the northwest and along the North Sea. France occupied the regions adjoining the upper Rhine. A central council, with

its seat at jointly-occupied Berlin, was to co-ordinate the administration of the four zones.

The Potsdam Conference. The further disposition of the conquered Reich was decided at a conference held at the old royal Prussian palace of Potsdam, July 17 to August 2, 1945, between President Truman, Premiers Churchill and Attlee and Marshal Stalin. It was announced that German life was to be reorganized. Army and navy were to be abolished and war production, actual or potential, to be eliminated. Reparations in kind were divided on a basis which gave the largest share to Russia. Eastern Germany was divided between Russia and Poland. Poland's western boundary was not fixed, but the country west of the Oder was placed under Polish administration. The conference also created a Council of Foreign Ministers, to meet at the respective capitals.

For the trial and execution of the war criminals, among whom were included the surviving Nazi leaders, an International Military Tribunal was set up at Nuremberg, September 1945. On October 1, 1946, the verdicts were pronounced. Goring, Keitel, Jodl, Von Ribbentrop, and eight others were sentenced to death; seven others to terms of imprisonment. The other liberated countries were already dealing with their own "collaborators." France imprisoned Petain, and executed Laval and others. Norway executed Quisling. The Netherlands and Belgium took similar action.

The Fall of Japan. In the United States rejoicing at the end of the war with Germany was tempered by the realization that another war was still to be won. The bulk of our troops in Europe had now to be transferred to the Pacific.

With the reconquest of the Philippines and the occupation of the Marianas islands, Japan's outer ring of defenses had fallen. The next attack was made on the inner line. It began at the little island of Iwo (Iwojima) in the Volcano group. The first landing was made on February 18, but the island was not completely occupied until March 18, at a cost of 20,000 casualties, including 4000 dead.

The next point of attack was Okinawa, in the long chain of the Ryukyu (Nansei) islands, between Formosa and Japan. On April 1 the Tenth army, under General S. B. Buckner, landed. The landing was made and the northern portion of the island occupied with little resistance, but on the hilly and strongly fortified southern tip the Japanese garrison of over 100,000 made a desperate resistance. Marines and infantry advanced foot by foot over rugged hills in the hardest fighting yet seen in the Pacific. Repeated attempts to relieve the island were beaten off. Constant "suicide" attacks on the American fleet sunk or damaged nearly 100 vessels. Okinawa fell on June 22. Its capture cost the Americans 39,000 casualties. The 11,000 dead included Gen. Buckner.

The war now came home to Japan. Large sections of Tokyo, Osaka, and Nagoya had been destroyed by long-range bombers based on the carrier *Hornet*. The Japanese navy had been driven from the sea, and a sea and air blockade was cutting off supplies from the Japanese conquests in the south. What was left of the fleet was destroyed in its harbors. The navy came into action, assisted by a British squadron, and through July the Third fleet ravaged the coasts with carrier-based planes, and even naval gunfire. City after city was reduced to ruins, industrial centers were destroyed and transportation wrecked. On August 6, the first atomic bomb fell.

For some years the problem of the "splitting of the atom" and the release of atomic energy for man's use had occupied the minds of physicists. For three years American, British, and Canadian scientists, with some assistance from European exiles, had been working on a mysterious "Manhattan Defense Project." Its reported cost was $2 billion, but the result was the splitting of the uranium atom (already accomplished) in such a way that its force could be controlled and used as an explosive. On July 16 the first successful experiment was made near Alamogordo, N. M. The first atomic bomb used in warfare was dropped upon the city of Hiroshima, and an area of 4½ square miles, 60 per cent of the city, was wiped out of existence. Two days later another bomb was dropped upon the seaport of Nagasaki.

In January 1945, Russia had given the required twelve months notice of the end of her non-aggression treaty with Japan. At Potsdam the Russians had promised to engage in the Asiatic war within three months after the surrender of Germany. On August 8 Russia declared war, and her armies swept into Manchuria and Korea. Meantime in the south Japan was losing. The British capture of Rangoon on May 4 completed their conquest of Burma. The Burma road was again open. The Chinese, with American assistance, were taking the offensive.

Already at Potsdam the Japanese had put out peace feelers through Russia, then a neutral, and had received a very definite choice between unconditional surrender and "total destruction." With the Russian entry, it also gave opportunity for the "saving of face" so dear to the oriental mind. On August 10, the Japanese emperor made Switzerland a qualified proposal of surrender, "ever anxious," as he later explained, "to advance the cause of world peace, and with a view to saving mankind the calamities to be imposed by further continuance of the war." At 7 P.M. August 14, President Truman announced that Japan had surrendered unconditionally.

End of World War II. On September 1 (September 2, by Tokyo time) on the U. S. battleship Missouri, in the harbor of Tokyo, General MacArthur, as Supreme Allied commander, accompanied by representatives of the Allied powers, received the formal surrender of Japan.

So the war ended, six years to a day after the German invasion of Poland; 3 years, 8 months, and 25 days after the Japanese attack on Pearl Harbor. America had paid for its victory with 1,058,000 casualties; 248,000 killed. Canada lost 36,000 killed, out of 101,000 casualties. Great Britain and the other dominions, 300,000 killed, with total casualties of 1,132,000.

On September 8, 1951, forty-eight nations signed a peace treaty with Japan at San Francisco. Russia and her satellites refused to sign. Although stripped of her former empire, Japan regained full sovereignty, and became eligible for United Nations membership.

Also at San Francisco, a Pacific defense pact was signed by the United States, Australia, and New Zealand, and another defense pact by the United States and the Philippines. At the same time still another security treaty was concluded between the United States and Japan authorizing the stationing of U.S. armed forces in and around Japan to deter armed attack upon that country. All these treaties were ratified by the United States in March 1952.

The San Francisco Conference. In pursuance of the recommendations of the Dumbarton Oaks and Yalta conferences, delegates from 51 nations met at San Francisco, April 25, 1945, to frame a "charter" for an organization of nations to maintain peace.

The charter was framed and adopted June 26, 1945, and submitted for ratification to the member nations. The United Nations came into being October 24, 1945, when Soviet Russia deposited with the United States Department of State the twenty-ninth instrument of ratification. See *United Nations*.

The Cold War. This term is applied to the conflict of policy originating in World War II between Communist Russia on the one hand and, on the other, the United States and other nations opposed to Communism. Basically it was due to Russia's belief in her destined role to spread Communism throughout the world.

During the war, Stalin, the Russian ruler, astutely obtained agreements from his allies favorable to extension of Russian power or ignored unfavor-

able agreements when in a position to do so. The first example relates to Germany.

Division of Germany. On September 12, 1944, it was agreed that Germany, when defeated, would be occupied in separate zones by Russia, Great Britain, and the United States and that it would be ruled by a joint council of the commanding officers. Berlin, although falling within the Russian zone, the largest of the three, was similarly divided into zones; corridors of access were provided for the other allies, later including France. The Russian commandants refused to co-operate in the council. The Western allies authorized a popularly elected government to take over in their sectors. The Russians responded by recognizing a soviet regime in East Germany. Berlin was similarly divided.

The second example relates to the countries of Eastern Europe and the Far East. It was agreed in 1945 that, after liberation from the Germans and Japanese, free elections should be held to establish governments in Poland, Rumania, Yugoslavia, Hungary, Czechoslovakia, and Korea. No free elections were held except in Czechoslovakia. Russia's alter ego, the Communist party, set up soviet regimes in those countries it reconquered, although this process was delayed in Czechoslovakia until 1947, when subversion and military threats had done their work. The Communist party set up a soviet regime also in the northern half of Korea, which the allies had agreed Russia might occupy.

Russia attempted in 1946 to force the Western powers from western Berlin by blocking surface traffic through the corridors. The reply was a massive air-lift of supplies to Berlin. Russia reopened the corridors to Berlin. Two years later, the North Atlantic Treaty Organization (NATO) was agreed to for combatting Russian expansion in Europe.

World-Wide Competition. Blocked in Europe, Russia turned next to Asia, where the cause of Communism had been enormously strengthened by adherence of China after the party leader Mao Tse-tung had overthrown the Nationalist Government in 1949. In June 1950, Communist North Korean forces invaded South Korea without warning. The United Nations authorized resistance, of which the main burden was carried by the United States. After three years of war, in which China also intervened, the North Korean Communists were confined again to their zone.

The above aspects of the cold war resembled, from the anti-Communist viewpoint, a fire-fighting operation. Another aspect, beginning shortly after World War II, had the character of fire prevention. The strength of Russia lay chiefly in the Communist party, with branches throughout the world, which was ready to fan discontent and take over control when the ruling hands faltered. Countermeasures dictated strengthening the rulers and proffering means to reduce discontent.

Rivalry Based on Aid. Greece was the first example. When Great Britain saw herself unable to continue support of Greece in the face of Communist-inspired disorders, the United States stepped in with military and economic aid. From this beginning rose the Marshall Plan, suggested by Gen. George C. Marshall, of sparking rebirth of prosperity by gifts and loans. The idea worked brilliantly in the countries of Europe, already rich in skilled manpower. The influence of those who preached revolution as the gateway to paradise steadily waned.

However, among the underdeveloped nations of Africa, Asia, and South America, the contest was less one-sided. One legacy of World War II was a passion for independence among countries that had been colonies and protectorates of more powerful nations. The Western powers had been the principal colonizers. Hence they were the targets of those who demanded independence. Even where there was no colonial tie, as with Latin American nations and the United States, the charge of economic and political exploitation was raised against them. Russia and later China sought to capitalize on this revolutionary movement by encouraging revolt and promising economic aid, covertly with a view to eventual establishment of Communist states. Russia's own repression of her satellite states was ignored by native leaders who sought Russia's aid against their "colonialist oppressors." In countries already independent, the United States normally supported the administration in power to suppress Communist subversion; the opposition therefore tended to label America as an imperialist power.

A key conflict arose in Egypt in 1956. The United States offered aid to build the high Aswan Dam. When Egypt's ruler, Nasser, accepted aid from Russia also, America's offer was withdrawn. Nasser then took possession of the Suez Canal in advance of the time its cession to Egypt had been promised by Britain and France. Israel seized the opportunity to attack Egypt because of its blockade of Israeli shipping. Britain and France intervened with air power. Russia threatened to support Egypt with atomic weapons. The United States declined a confrontation. Britain and France withdrew. Likewise, America remained quiescent when East Germany, Poland, and Hungary revolted and were reconquered by Russia.

The Crises. The next confrontation was not declined. Russia took advantage of a revolution in Cuba which brought Castro to the top—anti-American and pro-Communist. Russian launching sites for intermediate missiles capable of carrying atomic warheads were installed, as revealed by American air surveillance. President Kennedy declared a partial blockade of Cuba, warning Russia that the first missile firing from Cuba would bring massive retaliation against Russia and that any hostile move to take over Berlin would be met. Premier Khrushchev of Russia backed away, promising to withdraw the missiles from Cuba.

This was the turning point in the cold war. Thereafter, Russia signed a treaty for limiting nuclear tests, as proposed by the United States and Britain. Hostility to the West gradually decreased, under both Khrushchev and his successors. One factor was the increasing hostility toward China, whose claims to leadership split the Communist party in nearly all countries.

Newly independent countries became disillusioned with Russian and Chinese promises. Above all, the United States demonstrated its determination to withstand Communist encroachment by armed support of South Viet-Nam.

The Korean War. When Japan surrendered in 1945, the United States war department set the 38th parallel in Korea as the line to the northward of which the Russians would receive the surrender of Japanese troops, while the Americans did the same in the area south of the line. It was a temporary measure, but the Russians made a closed frontier of the parallel.

In November 1947, the UN created a commission to arrange and supervise elections in Korea, with a view to forming a United Korean government. Russia had held aloof from the proceedings of the commission, and the Red regime in North Korea, calling itself "The Democratic People's Republic of Korea," barred UN officials and refused to participate in the elections. Despite this, elections were held in May 1948 in the American occupation zone, and delegates to a national assembly chosen. The assembly adopted a constitution, and elected Dr. Syngman Rhee president of the new republic, which was promptly recognized by the United States. In December the General Assembly of the UN also recognized it as the legitimate government of Korea. In 1948–49 Soviet and American forces were withdrawn from North and South Korea, respectively.

The Red Invasion. On June 25, 1950, Russian-armed North Korean forces crossed the 38th parallel in a surprise attack which the less well equipped South Koreans were unable to turn back. At an emergency meeting of the Security Council a resolution was passed that same day stigmatizing the

attack as an aggression and calling on the North Koreans to cease hostilities and withdraw to the 38th parallel. All United Nations members were asked to assist in carrying out the resolution. Thanks to the Soviet Union's boycott of the Security Council, its representative was not present to veto the resolution.

On June 27th, President Truman stated to Congress that the invaders from North Korea had disregarded the United Nations order to withdraw and that, as assistance had been asked, he had ordered our air and sea forces to give the Korean troops cover and support.

Collective Action. Aid was quickly forthcoming. American planes went into action June 28th. On the 30th the first United States ground troops landed at Pusan from Japan. The Security Council on July 7th passed a resolution for a unified command under the United States for all United Nations forces in Korea. President Truman was asked to designate the commander. The following day he named General of the Army Douglas MacArthur commander in chief, and authorized him to use the flag of the United Nations.

Meanwhile, the Reds, who had taken Seoul within the first few days of fighting, were pressing their offensive vigorously and successfully, pushing the South Koreans before them as they drove down the peninsula. For more than two months there was a series of delaying actions and retreats, until all Korea, save for a relatively small beachhead at Pusan, was in Communist hands.

Then came the counteroffensive. A successful amphibious landing was made at Inchon, the port of Seoul, which was soon taken. The troops broke out of the Pusan beachhead, putting the North Koreans to flight. The allies reached the 38th parallel October 1. The pursuit of the Reds then continued to the Yalu river on the Manchurian border.

Communist China Enters the War. The end was in sight, but the situation changed with the entry of Communist China into the war. In November, powerful Chinese Red forces compelled a United Nations retreat, and it was not until January 1951 that the "Chinese herdes" were finally stopped on a line 75 miles south of the 38th parallel. On February 1 the General Assembly of the United Nations branded the Chinese Communist government aggressors. In February the United Nations took the offensive. Seoul, which had fallen to the Communists in January, was retaken March 15th.

On April 11th General MacArthur was relieved of his command by President Truman, who replaced him with General Matthew B. Ridgway. The end of the first year of the war found United Nations troops well north of the 38th parallel. By this time, 16 nations, besides the Republic of Korea, had forces in the field, but the brunt of the fighting had been borne by the United States.

The Truce Negotiations. In June 1951 Malik of Russia proposed a cease-fire agreement, and on July 10 protracted negotiations began between representatives of the United Nations, Communist China, and North Korea. Although agreement was reached on many points, the negotiations after being dragged out for more than a year finally bogged down over the question of what to do with the thousands of Chinese and North Korean prisoners who were unwilling to return home. The Allies declared that they would not send anybody back to a Communist country who did not wish to go, while the Communists were equally firm in insisting that all prisoners should be returned. On October 8, 1952 further talks were indefinitely postponed.

Following the death of Josef Stalin early in 1953, the Communist attitude toward this problem changed. At the suggestion of General Mark Clark, who succeeded General Ridgway as UN Commander in April 1952, an agreement was made and carried out for the exchange of sick and disabled prisoners. The Communists then agreed that they would not insist on the repatriation of all prisoners, and when further details had been settled, the armistice after just over two years of negotiations was finally signed at Panmunjom, July 27, 1953.

Collective Achievement. By fighting the Communists to a standstill in Korea the United States and the United Nations achieved what they set out to do when they entered the war. They stopped an unwarranted Communist attack on a free country.

In repelling the Reds, men from many nations fought side by side with the armed forces of the Republic of Korea—men from Australia, Belgium, Colombia, Canada, Ethiopia, France, Greece, Luxembourg, the Philippines, the Netherlands, New Zealand, Thailand, Turkey, Union of South Africa, the United Kingdom, and the United States.

Cost in Casualties. The thirty-seven months of fighting cost the United Nations forces more than 455,000 casualties in men killed, wounded, and missing. Of this number about 72,500 died. The heaviest losses were those suffered by the armed services of South Korea, with 300,000 casualties, including about 45,000 killed.

Statistics of United States losses, as announced by the Department of Defense, totalled 142,177, including 25,604 killed in action, 103,492 wounded, 8529 missing, 12,219 captured, and 2433 previously reported captured or missing and since returned to duty. Enemy battle casualties were put at 1,540,000, including 120,000 taken prisoner.

VIETNAM WAR. This war stemmed from French Indochina's war of liberation from France, which was disastrously defeated in 1954. In a conference of Vietnamese and interested nations at Geneva, it was agreed that, until 1956, control of North Vietnam should go to Communist-oriented leaders, with the South to be controlled by an anti-Communist group. An election, set for 1956 to choose a national government, was never held.

North Vietnam supported the Communist Viet Cong party in the South in its efforts to overthrow the government. South Vietnam called on the U.S. for military advisers to aid in pacifying the country.

The Viet Cong, directed and later assisted by North Vietnam, waged guerrilla warfare against the South, soon controlling most of the countryside. U.S. military aid was then sought by the South and was granted.

With U.S. aid, Viet Cong lines were thinned, underground forts cleared, and villagers now supplied intelligence to South Vietnam and U.S. troops. Hanoi, though not directly attacked, was largely depopulated for fear of bombing. Meanwhile, Red China could not promise aid because of internal commotion.

By 1968 U.S. bombings of the North were limited and the Paris peace talks between the U.S. and North Vietnam were begun; later, U.S. bombings were halted. In the following year came the first reduction of U.S. forces in Vietnam and the peace talks were expanded. North Vietnam's leader, Ho Chi Minh, died during the year, but the course of the war and the negotiations continued.

In 1970 U.S. forces entered Cambodia to clear Viet Cong "sanctuaries," captured arms caches, and later withdrew. The peace talks went on in Paris; the U.S. continued troop withdrawals and held to a policy of increasing South Vietnam's takeover of operations.

The U.S. made one last attempt to win the war in 1972, bombing the Hanoi-Haiphong area and mining Northern ports. Then, late in the year, secret talks suggested that peace was near and U.S. troops were reduced. In 1973, President Nixon halted all U.S. military operations in Vietnam. Later, American prisoners of war were released. U.S. participation officially ended, but fighting continued between the North and South until 1975. when North Vietnam won a conclusive victory.

THE following section deals with topics of world history which do not specifically concern the United States. These topics as a rule have respect to countries whose histories are to be found in the preceding sections. The topics are of such a nature, however, that they can be dealt with more satisfactorily in separate articles. In some cases, this situation is due to the fact that the topic concerns several countries; in other cases, an adequate treatment of a certain phase of a national history would be impossible without unduly interrupting the connected narrative of the country's development. Such topics have therefore received special treatment in accordance with their importance.

Abbassides, The (*ă-băs'ĭ-dēz*). The most famous dynasty of Mohammedan caliphs, taking its name from Abbas, the uncle of Mohammed. This family reigned in Bagdad from 750 until 1058, when the temporal power as monarchs was taken from it, though for 200 years following this date the caliphs were recognized as the spiritual heads of Islam. The greatest glory of the dynasty was the reign of Haroun-al-Raschid, 786–809, the contemporary and admirer of Charlemagne. The wealth and luxury of this period are celebrated in many stories of the *Arabian Nights*. Haroun-al-Raschid became a prince of romance, and Bagdad a synonym for courtly splendor. In the following reign, science and philosophy which enriched Europe were cultivated. But underneath the splendid surface were poverty and injustice which weakened the state and made it an easy prey to the invader. In 1258 the Abbassides were driven out of Bagdad by the Mongols, who burned the city. From 1258 to 1517 the Abbassides maintained a limited power in Egypt, when the last of the line was taken captive by the Turkish sultan, Selim I. See *Egypt*.

A. B. C. Powers. An expression which came into general use about 1914-15, to designate the group of three principal South American powers, Argentina, Brazil, and Chile. In the former year, these powers joined in a diplomatic effort to mediate in the difficulties between Mexico and the United States. In 1915, they concluded among themselves a group of treaties of peace and arbitration. See *Argentina*, *Brazil*, *Chile*.

Abdication. The renunciation of an office. Strictly this term is applied to the giving up of crown and authority by sovereign rulers of states, or by occupants of the papal throne. Various influences have prompted historic abdications. Sometimes the only motive has been the desire of the monarch to escape the cares of state; more often, however, compulsion, rebellion, or conquest has rendered such an act imperative. It is worthy of note that, though despotic or absolute monarchs are free to hand over the cares of state to another at any time they will, the situation is different in a limited monarchy. The king of England, for example, cannot lawfully abdicate without the consent of Parliament, the government of that country being in the nature of a constitutional contract between king and people.

In the following list are enumerated most of the important abdications recorded in history, including those due to the World Wars.

Diocletian	305
Maximian	305
Richard II of England	1399
Amadeus VIII of Savoy	1449
Charles V of the Holy Roman Empire	1556
Christina of Sweden	1654
Augustus of Poland	1706
Philip V of Spain	1724
Victor Amadeus II of Sardinia	1730
Stanislaus Leszczynski (of Poland)	1735
Poniatowski Leszczynski (of Poland)	1795
Charles Emmanuel II of Sardinia	1802
Charles IV of Spain	1808
Louis Bonaparte of Holland	1810
Napoleon	1814 and 1815
Victor Emmanuel I of Sardinia	1821
Charles X of France	1830
William I of the Netherlands	1840
Ferdinand of Austria	1848
Ludwig of Bavaria	1848
Louis Philippe of France	1848
Charles Albert of Sardinia	1849
Amadeus of Spain	1873
Alexander of Bulgaria	1886
Milan I of Serbia	1889
Dom Pedro of Brazil	1889
Hsuan-Tung, emperor of China	1912
Nicholas II of Russia	1917
William II, emperor of Germany	1918
King of Württemberg	November 10, 1918
King of Saxony	November 11, 1918
Grand Duke of Oldenburg	November 11, 1918
Charles, emperor of Austria	November 12, 1918
Prince of Reuss	November 12, 1918
Grand Duke of Saxe-Weimar	November 13, 1918
Prince of Waldeck-Pyrmont	November 14, 1918
Duke of Anhalt	November 14, 1918
King of Bavaria	November 16, 1918
Grand Duke of Baden	November 17, 1918
Duke of Saxe-Coburg	November 17, 1918
Grand Duke of Mecklenburg-Schwerin	November 17, 1918
Constantine of Greece, June 12, 1917, and Sept. 27, 1922	
Alfonso XIII of Spain	April 14, 1931
Prajadhipok of Siam	March 2, 1935
Edward VIII of Great Britain	December 10, 1936
Victor Emmanuel III	May 9, 1946
Michael of Rumania	December 30, 1947
Wilhelmina of the Netherlands	Sept. 4, 1948
Leopold III of Belgium	July 16, 1952
Farouk I of Egypt	July 26, 1952

Popes who have abdicated:

Marcellinus	308
Liberius	366

St. Celestine V	1294
Gregory XII	1415

Abencerrages (*ă-bĕn'sĕ-rā'jēz*). This celebrated family of Moors held pride of place among Oriental races as being of pure Arab descent. They were famous in Granada in the 15th century and figured prominently in Spanish romance, especially in the many accounts given of their massacre by the Zegris, inveterate rivals of that period. Accused by the latter of an intrigue against Abdallah, king of Granada, the Abencerrages were decoyed into the Alhambra, where 36 of their number were slain.

Achæan (*ă-kē'ăn*) **League, The.** This confederacy of Greek city-states of the Peloponnesus has been called "the most remarkable federal union in history before the founding of the United States of America." About 280 B. C. four little towns on the south shore of the Gulf of Corinth revived an ancient confederacy that had been destroyed by the Macedonian conquerors. Soon other towns joined in driving out the Macedonian tyrants. Within a few years the league included most of the cities of the Peloponnesus in its federal assembly, in which all citizens of the cities who chose to attend had a voice and a vote. For a hundred years, in spite of the narrow aristocratic power allowed by the character of the assembly, the league gave good government to its citizens. It was finally dissolved after the capture and destruction of Corinth by the Romans in 146 B. C. See *Greece*.

Adscriptus Glebæ (*ăd'skrĭp'tŭs glē'bē*). This Latin phrase means "bound" or "attached to the soil." An adscript was, in feudal times, a serf. He was regarded as an implement or chattel on his master's estate and in this sense belonged, or was attached to, the land. So true was this, that, on the transfer of an estate from one ownership to another, the new owner claimed as a right the serfs who were working on the estate at the time.

Afrikander. The Dutch name for African. Commonly used of native whites of Dutch or Huguenot ancestry in South Africa.

Albigenses (*ăl'bĭ-jĕn'sēz*). A name given to a sect also called Catharists, or "the pure," which taught a Manichean dualism, the conflict of two principles, good and evil. Triumph of the "good" was sought through extreme asceticism. The center of the heresy was in Languedoc, and it took its name from the city of Albi. In an endeavor to suppress the heresy, Innocent III sent legates in 1203 to southern France. One of them was assassinated and the pope organized a crusade against the Albigenses. Its leader was Simon de Montfort, and he and his followers seemed chiefly anxious to conquer rich estates in the South. The final result was to bring southern France under royal control.

Algeciras Conference. Prior to 1905, France carried on a policy of "peaceful penetration" in Morocco. In that year Wilhelm II of Germany visited Tangier and promised to uphold Moroccan independence. Peace being threatened, a conference of leading European powers was called at Algeciras in 1906. Aided by British influence, France's claims were upheld, and a mixed French and Spanish police force was set up.

When native disturbances occasioned the French seizure of Fez in 1911, the Germans protested and sent the warship *Panther*. This was known as the Agadir affair. In subsequent negotiations, France won from Germany recognition of her Morocco claims, ceding in return extensive territories in the Congo. Germany nevertheless considered herself humiliated and increased her army, thereby augmenting the suspicions which culminated in World War I.

Allied Debts. World War I and the readjustments immediately ensuing left the various Allied countries in debt to the United States to the amount of about 10.338 billion dollars, of which Great Britain owed 4.277 billion and France, 3.405 billion. Great Britain was a creditor to other Allies to the extent of about 7.270 billion dollars, and France had advanced to others about 2.775 billion dollars. The United States was thus the largest creditor; Great Britain was second, being owed about 3 billion more than her debt to the United States. On August 1, 1922, the British government announced that it would cancel all debts to it and reparation claims over and above what were required to meet its payments to the United States. The American government refused to admit any connection between reparations and Allied debts.

The British debt to the United States was funded in 1923, payments to be made over a period of 62 years. Most of the other debtor countries followed, the interest charges and installments being adjusted to their estimated capacity to pay. Payments were made regularly until 1931, when a world-wide financial crisis led President Hoover to propose a moratorium, subsequently ratified, on all Allied debts and German reparations. No more reparations were paid. After the moratorium most debtor countries defaulted immediately. Great Britain made one complete payment and two "token" payments. Finland alone continued to make her small payments due.

Amphictyonic (*ăm-fĭk'tĭ-ŏn'ĭk*) **League, The.** This name means "league of neighbors." In ancient Greece, before 500 B. C., there were several such leagues formed for the protection of various shrines and temples. The chief of these was the Delphic Amphictyony, or "The Amphictyonic League," which included in its council delegates from all the important states and represented a religious union of the Greek people. Its original purpose was the care of the temple at Delphi; but its council also laid down rules for more humane warfare, for instance, forbidding the cutting off of a town's water supply in war or peace. This was a first step in international law. The Amphictyonic League continued to exercise great religious and political sway as late as the 3d century A. D. See *Greece*.

Annus Mirabilis, "Wonderful Year." A phrase applied to various noted years in history. It gave the title to Dryden's poem, in which are commemorated the two English victories over the Dutch in 1666 and the Great Fire of London in the same year.

Armada, The. A Spanish word, meaning "armed force," but applied especially to the great naval expedition sent against England by Philip of Spain in 1588 and decisively defeated by the English fleet and the storms of the North Sea. Philip's purpose was three-fold: to suppress English Protestantism, to stop English piracy in Spanish America, and to prevent English aid from reaching the rebellious Netherlanders. When, after long delays in storms, the vast Spanish fleet appeared in the English channel, it numbered 120 ships, carrying 20,000 soldiers and 8000 sailors, besides the galley slaves. But Philip, whose policy suppressed invention in his own dominions, had failed to reckon with the superior intelligence of the Englishmen and also with their patriotism. Catholic and Protestant had united in a supreme effort to build up the depleted English navy. The Spanish ships, built after an old, high, unwieldy type, to carry many soldiers for fighting at close quarters, were no match for the new English vessels, built to sail swiftly and to carry heavier guns. The English commanders, Lord Howard, Drake, Hawkins, and Frobisher, allowed the *Armada* to pass Plymouth, July 21, 1588. Then, with a favoring southwest wind, they followed, and, in a series of sharp attacks at long and short range, so harried and crippled the Spaniards that on the 27th of July they anchored off Calais. Here eight fire ships were sent into the midst of the unwieldy floating castles, and they were compelled to put to sea. On the following day, off Gravelines, the helpless *Armada* was riddled by English shot. The wind rose to a storm which drove pursuers and pursued northward past the coasts of Holland, where the waiting prince of Parma saw his hope of transporting his army to England vanish. The Spanish admiral, the duke of Sidonia, himself utterly unpracticed in seafaring, saw his only chance of escape around the north of Scotland. Storm and wreck followed him into the Atlantic. Of the "invincible *Armada*" but 54 battered hulks were finally anchored in Santander bay. See *England*.

Armenian Massacres. By the Treaty of Berlin in 1878, the sultan of Turkey promised reforms in the government of Armenia; but these promises were not kept, and revolutionary movements arose among the oppressed people. In 1895 the Kurds, called in to police the country, carried on brutal massacres. Protests by England, France, and Russia were ignored. In 1909 at Adana and in Cilicia and northern Syria 30,000 Armenians were killed. It is estimated that, between April 1915 and January 1922, through a Turkish policy of extermination, nearly a million Armenians were massacred. See *Turkey, World War I*.

Assassins or **Hashisheens.** A fanatical military order instituted in Persia about 1090 by Hassan ben Sabah. They migrated to Syria and settled in the mountains of Lebanon, whence the name of their chief, who was known as "the Old Man of the Mountain." The secret murders they committed, in obedience to this chief, made them notorious. Their religion was a mixture of Mohammedanism, Judaism, and Christianity. They believed the Holy Spirit dwelt in their leader, and so they obeyed his orders as coming direct from God. For two centuries they were the terror of the surrounding nations. They fought, 50,000 strong, against the crusaders and became a formidable obstacle to the success of the Christian armies. They were at length overcome by the sultan Bibars in 1272.

Austrian Succession, War of. In 1740 Charles VI, Habsburg emperor, died without male heirs. Frederick II (the Great) seized Silesia. Other countries hastened to help divide the Austrian realms. Maria Theresa, daughter of Charles, loyally supported by her subjects and later aided by England and Holland, succeeded in preventing any losses of territory besides Silesia. Out of this war, ended by the Peace of Aix-la-Chapelle in 1748,

grew the rivalry of Prussia and Austria in Germany and that of England and France in America. See *Pragmatic Sanction.*

Avignon (*à'vē'nyôN'*) **Captivity.** The period of 70 years during which the popes were forced to reside at Avignon, on the southeastern border of medieval France. The influence of the French kings in the affairs of the papacy seemed so predominant that, when the Hundred Years' war broke out, England distrusted the popes as tools of the enemy. This humiliating sojourn lasted from the papacy of Clement V, 1309, until that of Gregory XI, 1377. It is known also as the Babylonian Captivity, the period of exile approximating to that of the Jews in the time of Nebuchadnezzar.

Babington Plot. A plot set on foot in 1585 by a number of young Catholic noblemen at court, acting, it is alleged, under the instructions of a Jesuit named Ballard. Letters secured by Walsingham, secretary of state and head of the secret service, were said to have proved Mary Stuart's complicity in the plot. Babington and his companions were condemned to death, Mary also being subsequently tried and executed for her part in this conspiracy

Baghdad Pact. What came to be known as the "Baghdad Pact" originated as a mutual defense treaty signed February 24, 1955 by Turkey and Iraq. Later that year the alliance was joined by Great Britain, Pakistan, and Iran, in that order. The United States, though not a member, cooperated with the organization's economic and military committees. Earlier Turkey had tried unsuccessfully to interest Egypt and other Arab states in forming a pro-western security system. Russia exerted strong pressure to prevent countries from joining. Designed to be somewhat like NATO as a warning to aggressors and a protector of small nations, the Baghdad Pact has been less effective because of cross-purposes among its members, as in the case of the Cyprus and Suez disputes, and because of a generally confused situation in the Middle East. It suffered most from the 1958 *coup d'etat* in Iraq which overthrew the pro-western government of that country.

Balaklava (*bà'là-klä'và*). The name of this little Russian seaport in the Crimea is famous because of two exploits of British troops in the battle of Balaklava, Oct. 25, 1854. A brigade of heavy cavalry, in a brilliant charge, repulsed a huge mass of Russian horsemen. More famous is the charge of the brigade of light cavalry, "the light brigade." A vague order to retake some guns was misunderstood, and the brigade, under Lord Cardigan, rode against the very center of the Russian army. Few escaped from the ensuing slaughter. "It is magnificent," said a French officer, "but it is not war."

Balance of Power. The name at first given to that relation of European states in which no one country is strong enough to threaten the safety of its neighbors. From the close of the religious struggle of the Thirty Years' war in 1648 to World War I, 1914–18, the chief concern of European diplomacy was the maintaining of the "balance of power." The advocacy of disarmament aims at bringing about an adjustment of power, not only among the sovereign states of Europe, but also among those throughout the rest of the civilized world, so that no one state can be in a position to menace or dominate another. See *Disarmament.*

Balkan League, The. An alliance formed in 1912 by Bulgaria, Serbia, Greece, and Montenegro for the purpose of action against Turkey. It lasted barely a year, being broken in the bloody dispute which arose among the allies after their complete defeat of the Turk in 1913. See *Greece, Turkey.*

Barmecides. A wealthy Persian family who furnished viziers to Haroun-al-Raschid and to former caliphs of Baghdad; so called from their founder Barmek. Jaffar became the favorite vizier of the caliph, and, by his magnificent services and patronage of the arts, reflected great glory on his master's reign. Through jealousy or suspicion or both, Jaffar fell into disgrace with Haroun-al-Raschid, who put him to death in 802, together with nearly all of the Barmecide family.

Bashi-Bazouks (*bäsh'ĭ-bà-zōōks'*). Irregular troops or volunteers attached to the Turkish army and noted for their wildness and cruelty. As a rule, they are mounted and serve for their maintenance without pay; this deficiency, however, they rectify by acts of pillage. Their services are also used by the municipal authorities, who often detail them to escort travelers wishing to explore the country. Such services are by no means inexpensive, as the Bashi-Bazouks expect not only to be fed well, but to be rewarded generously. Their uniform being that of tatterdemalions, they are called *Bashi-Bazouks*, which signifies "disorderly appearance."

Bastille (*bàs-tēl'*), **Destruction of the.** The famous fortress of the Bastille once flanked the city gate of St. Antoine, Paris. Its construction was begun, under Charles V, by the provost Hugh Aubriot in 1370 and was completed in 1382. It became in a short time a prison of state and held within its walls, among other illustrious victims, such men as Jacques d'Armagnac, "The Man with the Iron Mask," Voltaire, and Lally-Tollendal. Its terrors reached their climax during the ministry of Richelieu, 1624–42. In the reign of Louis XI, cages of iron had been built, and the vaults beneath the towers, being on a level with the water in the moat, were the object of especial dread. For the populace, the Bastille stood as the symbol of royal despotism.

Louis XVI, June 23, 1789, had declared certain recent acts of the third estate of the National Assembly to be unconstitutional. He sent Brézé, his master of ceremonies, to bid the members withdraw from the hall of the Convention. Mirabeau, a French noble who had been chosen a deputy by the third estate, exclaimed with passion, "Go tell your master we are here by the will of the people and shall leave only at the point of the bayonet!" A few days later foreign mercenaries appeared in Paris. The Assembly sent to the king, demanding their removal. Louis replied by dismissing Necker, a minister favorable to reform and trusted by the people. Camille Desmoulins, a young journalist, announced the news in public on July 12. Paris was all aflame. Two days later, July 14, the populace, re-enforced by companies of French Guards, attacked the ancient monument of tyranny. De Launay, the commander, offered to surrender. When the doors of the fortress were thrown open, the mob seized him and a few of the Swiss Guards and murdered them. The heads of De Launay and Major de Losme of the Swiss were mounted on pikes and carried about the city. The walls of the grim fortress were later pulled down, so that not "one stone was left upon another." The fall of the Bastille is one of the most dramatic events in modern history. Its anniversary is celebrated in France as the chief national holiday and as the day when a new era of liberty dawned for the people and an end was put to the *ancien régime.* It is interesting to note that Lafayette sent the key of the fortress to George Washington "because the principles of America it was that opened the Bastille." This relic may still be seen at Mt. Vernon.

Bath, Order of the. An order of knighthood, founded by Henry IV in 1399. From the time of Charles I it lapsed, until revived by George I in 1725 as a military order, which it remained until 1845. It was then established on its present basis with a military and a civil division.

BATTLES OF THE WORLD, DECISIVE

1. Marathon, Sept., 490 B. C. A small Greek army, commanded by Miltiades, defeated a much larger Persian force. The Persians were compelled to retreat into Asia.

2. Syracuse, 413 B. C. The besieged Syracusans turned upon and almost completely destroyed the invading Athenian forces.

3. Arbela, Oct. 1, 331 B. C. The Greeks, led by Alexander the Great, defeated the Persian armies of Darius and overthrew the Persian power.

4. Metaurus, 207 B. C. The Carthaginians, led by Hasdrubal, the brother of Hannibal, were defeated by the Romans under the command of Marcus Livius and Claudius Nero.

5. Teutoburg. 9 (?) A. D. The Roman legions, led by Varus, were defeated by the Germans under Arminius. This victory freed Germany permanently from the Roman power.

6. Châlons, 451 A. D. The Romans and their allies, the Visigoths, led by Aëtius, defeated the Huns and their Ostrogoth and other allies, led by Attila, compelling them to retire into Pannonia.

7. Tours, 732 A. D. The Franks under Charles Martel, won a great victory over the invading hosts of the Saracens, led by Abderrahman. This conflict, which checked the Mohammedan invasion of western Europe, is known also as the battle of Poitiers.

8. Hastings, October 14, 1066. The Norman invaders defeated the Saxons. King Harold of England lost his life, and the kingdom passed to William, duke of Normandy.

9. Orleans, May 8, 1429. The siege of Orleans by the English was raised by the French, led by Joan of Arc. This victory insured the final defeat of the English invaders of France.

10. Defeat of the Spanish Armada, July 20–29, 1588. The Spanish fleet was almost completely destroyed by the British fleet and by severe storms.

11. Blenheim, Aug. 13, 1704. The French and Bavarians were defeated by the English under the duke of Marlborough, aided by their allies led by Prince Eugene.

12. Pultowa, July 8, 1709. Charles XII of Sweden was completely defeated by the Russians under Czar Peter the Great.

13. Quebec, Fall of, Sept. 17, 1759. After an extended siege and after the battle on the Heights of Abraham, where the English under Wolfe defeated the French under Montcalm, the French surrendered the city.

14. Saratoga Oct. 7, 1777. The British army under General Burgoyne was utterly defeated by the Americans. The entire force was surrendered on Oct. 17 to the American commander, General Gates.

15. Valmy, Sept. 20, 1792. The French forces, commanded by Kellermann, defeated the Prussians, commanded by the duke of Brunswick.

16. Waterloo, June 18, 1815. Napoleon and his French forces were finally defeated by the British and their allies under the duke of Wellington

17. Gettysburg, July 1–3, 1863. The Confederate troops under Lee were defeated by the Federals under Meade. Confederate invasion of the North was proved impossible.

18. Vicksburg, The Fall of, July 4, 1863. The capture of this stronghold by Grant, in command of the Federal army, gave command of the Mississippi to the North and cut the Confederacy in two. The Confederate general, Pemberton, surrendered after a long siege.

19. Sedan, Sept. 1, 1870. Defeat of the French forces by the Germans compelled the surrender of the French army in Sedan and of Emperor Napoleon III.

20. Tsushima, or **The Sea of Japan,** May 27–28, 1905. The Japanese, under Admiral Togo, destroyed Rojestvensky's Russian fleet, establishing Japanese sea-power.

21. The Marne, First Battle of, Sept. 6–9, 1914. The British and French armies checked the German advance, and with it the German hope for a speedy victory.

22. Jutland, May 31, 1916. The defeat of the German fleet confirmed British control of the sea.

23. Stalingrad, Aug. 1942–Jan. 1943. The Russian resistance at Stalingrad on the Volga, and the destruction of the German army besieging it, was the turning-point on the eastern front.

24. Normandy, June 6–July 18, 1944. The landing and establishment of the Anglo-American armies on the Norman coast made possible the liberation of France and the invasion of Germany.

25. Philippine Sea, Second Battle of, Sept. 25, 1944. The defeat of the Japanese fleet off Leyte ruined Japan's sea-power, and left her open to invasion.

Bayonne (*bā'yŏn'*) **Decree.** Napoleon's decree of 1808, ordering the seizure of all vessels under the American flag found in French ports, claiming that since all American vessels were held at home by the Embargo Act, these were English vessels in disguise.

Belgian Congo. Formerly Congo Free State and, since 1960, the Congo Republic. It owed its existence largely to Leopold II, king of the Belgians. In 1876, Leopold, in co-operation with several European governments, formed the International African Association, to promote the exploration and colonization of Africa. He employed Henry M. Stanley to explore the Congo region, and Stanley was active in founding stations, and making treaties with the native chiefs. After several powers, including the United States, had recognized the independent Congo Free State, the Berlin Conference of 1885 declared it neutral, and open to the trade of all nations, with Leopold as its personal sovereign. Governmental abuses, which arose under this régime, aroused international protest. From 1908, until it gained its independence in 1960, it was a Belgian colony.

Belgian Neutrality Treaty. The Treaty of London, 1839, signed by Austria, Belgium, France, Great Britain, Prussia, and Russia, guaranteed the perpetual neutrality of Belgium. This neutrality being threatened by the Franco-Prussian war in 1870, the belligerents signed special agreements with Great Britain to respect Belgian neutrality. In 1914 Germany was charged with violating the treaty obligation. The agreement was abrogated by the Treaty of Versailles in 1919.

Benelux. A term applied to an economic agreement made in 1947 between Belgium, the Netherlands, and Luxembourg aiming at full economic and monetary union for all three countries.

BISHOPS AND POPES OF ROME

The word pope is derived from an ecclesiastical Latin word *papa,* meaning "father," applied in the early Christian centuries as a term of respect to clergy of high rank, especially bishops. By the 5th century, the title had come to be applied almost altogether to the bishop of Rome, and from the 11th century it has been claimed exclusively for him as the sovereign pontiff of the Roman Catholic Church.

Primarily the pope, as the successor of Saint Peter, is the bishop of Rome. The actual predominance of Rome over other episcopal sees was, as early as the 1st century, acknowledged by the then universal church. This supremacy, through a gradual process extending over several centuries, grew and expanded with the natural development of the Christian Church. The council of Chalcedon in 451 accepted as authoritative the profession of faith proposed by Leo I. The pontificates of Gregory the Great (590–604), Gregory VII (1073–85), and Innocent III (1198–1216) mark important stages in the growth of the papal power.

Electors. Early accounts of elections indicate that for several centuries the right of choosing bishops and the early popes was shared by both the clerical and the lay members of the Christian community of Rome and of its neighboring territory. After the election had come to be a concern of the entire Church, the possession of the right was restricted, until at length, in the 12th century, it came to be confined to the college of cardinals. The pope is now elected by a body known as the conclave, which includes all cardinals of the world. The creation of 24 new cardinals in 1953 brought the sacred college to 70. Pope John XXIII created 10 new cardinals bringing the total to 90 in 1962. In 1968, the sacred college comprised 109 members.

The Conclave. The word conclave signifies a room which may be locked, and is often applied to the apartments in which the papal electoral body meets, as well as to the assemblage itself. The cardinals are required to live in entire seclusion from the outside world during the period necessary to secure the election of a new pope. After the death of a pope, a portion of the Vatican adjoining the Sistine Chapel is walled off and divided into apartments of three or four rooms each where the cardinals live. Each may be accompanied by a secretary and a servant, who are called conclavists.

Method of Election. The conclave opens officially the evening of the fifteenth day after the pontiff's death. On the morning of the sixteenth day, the cardinals assemble for the actual balloting in the Sistine Chapel. The voting is by secret ballot, and for an election a two-thirds plus one vote is required.

Two ballots are taken each day, in the morning and in the evening, until an election is secured. After each ballot, the votes are burned. If no election has taken place, damp straw is mixed with the paper, and the resulting dark smoke, the famous *sfumata*, from the chimney, informs the people waiting outside that a new pope has not yet been chosen. When the new pope has been chosen, the paper ballots alone are burned without the straw and a white almost invisible smoke from the chimney notifies the populace that the pope at last has been elected.

Installation. When a candidate has received the necessary two-thirds vote plus one, the doors of the chapel are opened. Upon formal inquiry by the presiding dean as to whether the newly chosen pontiff is willing to accept the burden of the papacy, the pope-elect duly declares his assent and announces the name by which he desires to be known. He is then clothed in the papal vestments, and receives the first homage of the cardinals. Following this ceremony occurs the public announcement of the election. On the election of Pius XI in 1922, this proclamation, for the first time since 1870, was made from the gallery of Saint Peter's. The pope's jurisdiction begins with his election, but he dates his pontificate from the following Sunday or holyday upon which the formal coronation takes place.

The following list contains the names, with the dates of their pontificates, of the pontiffs who have occupied the chair of Saint Peter. The list will be found especially valuable for reference in connection with the study of the various periods of European history.

Pontiff	Pontificate	
	First Century	
	A. D.	A. D.
1 Saint Peter		67(?)
2 Saint Linus	67	79(?)
3 Saint Anacletus	79	90(?)
4 Saint Clement I	90	99(?)
	Second Century	
5 Saint Evaristus	99	107(?)
6 Saint Alexander I	107	116(?)
7 Saint Sixtus I	116	125(?)
8 Saint Telesphorus	125	136(?)
9 Saint Hyginus	136	140(?)
10 Saint Pius I	140	154(?)
11 Saint Anicetus	154	165(?)
12 Saint Soter	165	174
13 Saint Eleutherius	174	189
14 Saint Victor I	189	198
15 Saint Zephyrinus	198	217
	Third Century	
16 Calixtus I	217	222
17 Urban I	222	230
18 Saint Pontian	230	235
19 Saint Anterus	235	236
20 Saint Fabian	236	250
21 Cornelius	251	253
22 Saint Lucius I	253	254
23 Saint Stephen I	254	257
24 Saint Sixtus II	257	258
25 Saint Dionysius	259	268
26 Saint Felix I	269	274
27 Saint Eutychianus	275	283
28 Saint Caius	283	296
	Fourth Century	
29 Saint Marcellinus	296	304
30 Saint Marcellus I	308	309
31 Saint Eusebius	309	(310)
32 Saint Miltiades	311	314
33 Saint Silvester I	314	335
34 Saint Mark	336	
35 Saint Julius I	337	352
36 Liberius	352	366
37 Saint Damasus I	366	384
38 Saint Siricius	384	398
39 Saint Anastasius I	398	401
	Fifth Century	
	A. D.	A. D.
40 Innocent I	402	417
41 Saint Zosimus	417	418
42 Saint Boniface I	418	422
43 Saint Celestine I	422	432
44 Saint Sixtus III	432	440
45 Saint Leo I, "The Great"	440	461
46 Saint Hilarius	461	468
47 Saint Simplicius	468	483
48 Saint Fe ix III	483	492
49 Saint Gelasius I	492	496
50 Anastasius II	496	498
	Sixth Century	
51 Saint Symmachus	498	514
52 Saint Hormisdas	514	523
53 Saint John I	523	526
54 Felix IV	526	530
55 Boniface II	530	532
56 John II	533	535
57 Saint Agapetus I	535	536
58 Saint Silverius	536	538(?)
59 Vigilius	538(?)	555
60 Pelagius I	556	561
61 John III	561	574
62 Benedict I	575	579
63 Pelagius II	579	590
	Seventh Century	
64 Saint Gregory I, "The Great"	590	604
65 Sabinianus	604	606
66 Boniface III	607	
67 Saint Boniface IV	608	615
68 Saint Deusdedit	615	618
69 Boniface V	619	625
70 Honorius I	625	638
71 Severinus	638	640
72 John IV	640	642
73 Theodore I	642	649
74 Saint Martin I	649	655
75 Saint Eugenius I	654	657
76 Saint Vitalianus	657	672
77 Saint Adeodatus	672	676
78 Donus	676	678
79 Saint Agatho	678	681
80 Saint Leo II	682	683

* By some historians regarded as anti-pope.

Black Death. One of the most famous and most destructive plagues of history. Spreading westward from Asia, it swept away from one-third to one-half the population of Europe in the years 1347–50. The disease was named from the black spots that appeared on the bodies of those afflicted. It may have been similar to what is now called "bubonic plague."

Black Hole of Calcutta. A small cell, intended for two or three men, in the East India Company's citadel, Fort William. The story told by the commandant, J. Z. Holwell, is that the subahdar of Bengal, who stormed the fort, June 20, 1756, had his guards drive all the white inmates of the fort, 146 in number, into this almost airless room where they were left overnight to die of suffocation. Only 23 were alive in the morning.

Black Shirts. A name applied to the members of the Fascist party in Italy, by whom the black shirt was worn as a party badge.

Boers (*bo͝orz*). The Dutch colonists in South Africa. Boer is a Dutch word meaning peasant or farmer. The Boers first settled in Cape Colony in 1652. Through a century and a half of pioneer life, these people maintained a stern type of Calvinistic faith which intensified their severe exclusiveness. Besides, they firmly believed in their right to enslave the native peoples. When the colony was finally ceded to Great Britain in 1815, the policies of the new government in respect to the natives roused the opposition of the Boers. In 1835 they started the Great Trek, or migration, to the Orange River district, where they settled in the Orange Free State. Later, a large body moved beyond the Vaal, where they organized the Transvaal Republic. Here, under the presidency of Paul Kruger, elected in 1883, they maintained a stubborn independence until the victory of the British in the Boer war. After that time, through the statesmanship of such men as Lord Milner, General Botha, and General Smuts, the reconciliation of Boers and English progressed rapidly inside South Africa.

Botany Bay. A small inlet on the coast of New South Wales, where the first convict establishment was formed in 1788. Later in the same year the penal settlement was removed to Port Jackson, but the name Botany bay was constantly used, generically, for the convict settlements in Australia. Captain Cook, in 1770, gave the bay its present name on account of the many strange plants he found there.

Bourbon Family. Members of this royal line have governed France, Spain, the Two Sicilies, Lucca, and Parma. The family is traced to Robert of Clermont, youngest son of Louis IX, but the name comes from Louis, duke of Bourbon, who died in 1341. French kings of this house were Henry IV, Louis XIII, XIV, XV, XVI, XVII, XVIII, and Charles X.

Boxer Uprising. The patriotic, antiforeign demonstration in China in 1900 led by the Chinese secret society called "The Fist of Righteous Harmony" or, popularly, "Boxers." The outbreak was precipitated by the foreign occupation of Chinese ports,—Kiaochow by Germany, Port Arthur by Russia, Weihaiwei by England, and Kwang-chow by France. The government failed to control the insurgents, and the warships of the powers, except the United States, intensified the antiforeign feeling of the Chinese by bombarding the forts at Taku. The foreign legations at Peking were besieged, and finally a relief force of Japanese, Russian, British, French, German, and American troops, commanded by Count Waldersee, advanced on the capital and relieved the legations on August 14. The 9th regiment, United States army, suffered heavy losses, including its colonel and several other officers. Military operations continued until the spring of 1901. An indemnity of $333,000,000 was imposed on China by the allied powers, the United States and various other countries later resigning claim to their shares. See *China*.

Boycotting. A system of reprisals organized in 1880 by the Land League in Ireland in return for the harsh treatment of tenants by landowners and their agents. It took its name from one Captain James Boycott, a landlord of Mayo. The victim of boycotting was cut off from the social and commercial life of the community, being permitted neither to buy nor to sell, and those attempting to deal with him were treated in like manner.

Brest-Litovsk (*brĕst'lyĕ-tôfsk'*), **Treaty of.** The treaty of peace concluded March 3, 1918, between Germany and the Bolsheviki, by which Germany was to gain control of Finland, the Baltic provinces, Lithuania, Poland, and the Ukraine, and direction of Russian industry. Although never enforced, it enabled the Germans to transfer troops to the western front at a critical moment of World War I.

Buccaneers. An association of sea rovers formed about 1525, to harry the Spanish possessions in South America and prey upon their commerce. They were of various nationalities, but chiefly English and French, their most famous leaders being Montbars, known as the Exterminator, and Henry Morgan, afterwards Sir Henry and deputy-governor of Jamaica. Under the latter leader they crossed the isthmus and sacked the city of Panama in 1671, and for years they paralyzed the Spanish trade, both in the Caribbean Sea and in the Pacific. They ceased to exist as an association early in the 18th century, but some of them continued careers of indiscriminate piracy for many years longer. The name is said to be derived from *buccan*, which in the Caribbean islands meant to dry meat on a frame, or *buccan*, over smoke. The early French adventurers adopted this custom.

Bulgarian Atrocities. A rising of the Mohammedan inhabitants of Bulgaria, assisted by the Bashi-Bazouks, or Turkish Irregulars, against the Christians in 1876. Thousands of Christians were massacred. Turkey refused redress, and Russia consequently declared war in the following year.

Burgundy. The name is derived from the Burgundians, a Teutonic people who settled in eastern Gaul in the 5th century. In 1361 the duchy of Burgundy, of which the chief town was Dijon, became a possession of the French crown. It was conferred upon Philip the Bold. He and his vigorous descendants enlarged their territories until, in the 15th century, Burgundy was one of the most important European states, controlling the rich territories and cities of the Low Countries, now Holland and Belgium. Duke Charles the Bold successfully maintained his position against the scheming Louis XI, until he was slain at the battle of Nancy in 1477. The Burgundian realms were then divided between France and Austria, since the Habsburg Maximilian had married Mary, daughter and sole heir of Charles.

Cahiers de Doléances (*kȧ'yā' dĕ dô'lā'ȧNs'*). "Documents of Grievances." These documents contained representations of grievances and demands made by the people. They were signed and laid before the king of France in 1789 by the deputies of the States-General. The principal demands were: suppression of the sale of public offices; the abrogation of judicial power claimed by the owners of certain hereditary estates, who acted as resident magistrates; the repeal of the gabelle, an iniquitous tax on salt; the abolition of the corvée, which exacted free labor from the peasant on the part of the landowner; the suppression of the militia ballot; religious toleration; and better conditions for the clergy.

Caliphate of Cordova. The powerful western dynasty of caliphs. After the decisive battle of Tours in 732, Cordova became the capital of Moorish Spain. Abderrahman, one of the family of Ommiad caliphs of Damascus, who had escaped the massacre inflicted on his house by the rival Abbassides, founded there a new caliphate. Under this powerful dynasty, the caliphate of Cordova became, in culture, wealth, and splendor, the formidable rival of the Abbasside caliphate at Baghdad. This division in the world of Islam relieved Europe from the threat of Mohammedan conquest. See *Abbassides*, *Arabs*, *Moors*, *Spain*.

Canossa. The castle of Matilda of Tuscany, where Gregory VII was staying when the emperor Henry IV made a pilgrimage to Italy, in 1077, to make his submission to the pope, who had excommunicated him. He was treated in the most humiliating fashion by Gregory, who left him for three days in the snow in the courtyard of the castle before consenting to receive him. Hence arose the proverbial expression "Go to Canossa," mean-

ing surrender to the claims of the Church. See *Germany.*

Capetian Dynasty. The remarkable line of kings who ruled France from the election of Hugh Capet in 987 to the fall of Louis Philippe in 1848. The real father of the line was Robert the Strong, said to have been the son of a butcher in Paris. He and his son Odo held the Northmen back from Paris and central France. Odo was chosen king in 887, and in 987 his grandnephew Hugh was made king when the Carolingian line had died out. The name *Capet* comes from Hugh's custom of wearing an abbot's *cape.* The first break in the direct line of descent came with the accession of Philip VI (of Valois) in 1328. The houses of Valois, Bourbon, and Orleans were branches of the Capetian family. See *France.*

Carolingian or **Carlovingian Dynasty.** The second dynasty of the Frankish kings. The name is derived from the Latin *Carolus* (Charles), the name of Charles Martel or of Charles the Great. The first king of the line was Pepin the Short, son of Charles Martel, who deposed the Merovingian king in 751. Charles the Great, or Charlemagne, the greatest of the family, reigned from 768 to 814. The line died out with Louis V in 987. See *France.*

Catacombs. Underground galleries of intricate pattern used, particularly by the early Christians in Rome, as places of burial, of religious worship, and of refuge during persecutions. Catacombs had been employed as burial places by the Etruscans some eight centuries before the Christian era. Roman noble families and Jews in Rome also made use of them. Their greatest development, however, was due to the Christians.

These labyrinthine passages, often one above the other, with many interconnecting branches and blind alleys, are from 30 to 50 feet underground, descent being provided by stairways. In width about three to four feet and twelve feet in height, they honey-comb the environs of Rome, encircling the city at a distance of a mile or two outside the city walls. Their total length is estimated to exceed 750 miles in some 75 separate units. Chambers or chapels were constructed at intervals, their walls being frequently ornamented with paintings of sacred subjects. The dead were placed in recesses excavated in the side walls of the passages and were closed in with slabs sealed with cement. Some two million corpses are estimated to have been so interred. Burial in the catacombs ceased with the sack of Rome by the Goths in 410 A. D. Their existence was forgotten from the 12th century until their accidental rediscovery in 1578. Catacombs have been discovered also in Syracuse, Alexandria, and other communities of the Mediterranean region.

Cavaliers. Royalist sympathizers in England and in the American Colonies during the reigns of Charles I and Charles II. See *Roundheads.*

Cawnpore or **Cawnpur, Massacre of.** The massacre by Nana Sahib of the English garrison in Cawnpore, during the Indian mutiny of 1857. The garrison had surrendered under a pledge of being permitted to retire unharmed. Of those massacred, 560 were women and children. See *Sepoy Mutiny.*

Chaldea (*kăl-dē'ä*). The most ancient name of the territory in the lower Tigris and Euphrates valley, practically identical with Babylonia. About 2800 B. C. it became the center of an empire under Sargon, king of Accad. His power extended into the northern Mesopotamian valley and westward to the Mediterranean, but after his death this empire broke up. New Arabian invaders entered Chaldea and made Babylon their capital. They continued to spread Chaldean culture, traditions, and the cuneiform (wedge-shape) system of writing over all western Asia.

Chartist Movement, The, or **Chartism.** A radical reform movement in England in the period from 1838 to 1848. The name arose from the National or People's Charter drawn up by a group of members of Parliament and workingmen, which demanded universal suffrage and salaries for members of Parliament. The causes of the movement were the failure of the Reform bill of 1832 to include the working classes in its benefits and the terrible misery and want among these classes. The movement continued, with various attempts to secure Parliamentary action and with frequent riots, until 1848, when some improvements in working conditions and a period of cheaper food following the repeal of the corn laws robbed it of its strength. See *England.*

Children's Crusade. This tragic incident of the period of the Crusades has been the theme of sober history and of legend. The facts are established that thousands of children and youths—their numbers being estimated at from 50,000 to 90,000—inspired apparently by the crusading spirit of the times, left their homes in the year 1212 and marched in many bands toward the Mediterranean ports of embarkation for the Holy Land. The leaders in France and Germany were two peasant boys. Some of the bands were accompanied by a few older persons, who in most cases appear to have preyed upon the children rather than to have protected them. The fate of the young crusaders is obscure. Some returned sadly to their homes, but many lost their lives. Some are said to have been lost at sea; others, sold into slavery.

Cinque (*sĭngk*) **Ports.** The ancient name of five English Channel ports, Sandwich, Dover, Hythe, Romney, and Hastings, to which later two more, Winchelsea and Rye, were added. *Cinque* is the Old French word for "five." These towns were granted certain independent privileges by the early Norman kings, in return for which their chief service was to furnish ships and sailors to the king, England having no regular navy before the reign of Henry VII (1485–1509).

Clan-na-Gael (*klăn'nà-gāl'*). An Irish secret society, an offshoot of the Fenians, formed in 1881. It was composed of the extreme physical force men among the Fenians and was known also as the United Brotherhood. See *England, Fenians, Ireland.*

Cockpit of Europe. The name given to Belgium on account of the numerous important battles which have been fought there. See *Belgium.*

Code Napoleon. The code of law issued by Napoleon in 1804. It was based on the old French law, with such alterations as had been rendered necessary by the Revolution, and on certain new provisions, introduced by Napoleon, notably those relating to the law of succession and to the marriage law. For the purpose of this codification, which remains the law of France, he called to his councils the most eminent French lawyers, irrespective of party,—among others Tronchet, Cambacérès, Portalis, and Roederer.

Code of Justinian. The systematic body or code of Roman law prepared by a commission of lawyers appointed by the emperor Justinian (527–565). This code, called the *Corpus Juris Civilis,* or "Body of Civil Law," became the basis of nearly all modern European legal systems. Its principles influenced the common law of England, which has prevailed also in the United States. See *Rome.*

Commune, Paris. An outbreak of the extreme revolutionary party in Paris in 1871 (March 18–May 27), after the National Assembly, which met at Bordeaux, had agreed to peace with the victorious Germans, ceding Alsace and Lorraine, and had decided to transfer its sittings to Versailles rather than to Paris. The radical Parisians accused the Assembly of being monarchist and of the design of overthrowing the republic constituted the September previous. Among the revolutionaries were leading socialists and representatives of the *Internationale.* One of the leading projects was to

grant autonomy to the communes, or city governments, uniting them by a loose tie to the central government. Thiers, who had been chosen head of the executive in the new government, reorganized the army and prepared to capture Paris. The Germans still occupied the forts on the northern side of the city, for the Peace of Frankfort was not signed until May 18. In the struggle that followed, neither side gave quarter. The *Communards* even put to death the hostages they had seized, including the archbishop of Paris. Thousands of those who were captured by the national troops were shot without a trial.

Communist Party. Political party, organized in nearly all countries in the 20th century, which differs from most political parties in its objective of taking over the government, appropriating for the state the means of production, and establishing a "dictatorship of the proletariat." The parent of such parties was the Bolshevik party, which seized power in Russia in 1919. See *Bolshevism.*

Communist parties outside of Russia owed their origin largely to the inspiration and later to the direction and control by the Communist International (Comintern), organized in 1919 by the Russian Communist party. The Comintern's influence was based on social discontent in each country and on the appeal of its program to persons in those countries who saw in it a quick means of getting rid of social injustices. Its evangelic appeal seduced numerous gifted persons, whom missionaries of the International were quick to entrap and to enlist in efforts to undermine their own governments.

Party members were sworn to blind obedience to orders, and orders came from the head of the Comintern. Obedience was enforced, where possible, by terroristic methods. Detection was made difficult by the device of isolating members in small "cells" to prevent their acquaintance with more than a few others. The aim was to infiltrate the government itself in each nation while exploiting discontents and spreading disorders until an opportunity came for taking over political control.

In 1943, the Comintern was declared dissolved by Russia to disarm the suspicions of its allies in World War II. But its greatest successes were to come. Czechoslovakia was taken over by the party's usual methods in 1948. China embraced communism the same year, succumbing to methods learned in Russia, although the leaders later adopted governmental methods of their own which led to estrangement from Russia. Finally, in 1958, Cuba's Communist party took advantage of Fidel Castro's revolution to win control of the government through Castro and his aides.

In most countries, however, the tactics of the Communist party were completely futile; the bulk of the citizens were deaf to its appeal, particularly when they saw the type of society to which its program led in Russia; arrest and conviction of members for espionage revealed the party's unscrupulous methods to the public; in many countries membership in the Communist party was made unlawful. In the United States much the same effect was produced by court rulings that the party is an agency of a foreign government and hence subject to a 1950 law requiring registration.

Tactics of the Communist party produced little success among the emerging nations of Africa or among the Arab nations. Egypt, for example, while accepting Russian armaments, suppressed the party. In nearly all countries the party was weakened by the schism between Russia and China, partisans of the two countries forming factions which tended to paralyze concerted action.

Concert of Europe. A diplomatic term long applied to the idea of European powers acting as a unit. Such a concert of princes was set up after the Congress of Vienna in 1815. This broke down before the rise of national ambitions. The ideal expressed in the phrase is a vague foreshadowing of a league of nations. See *Congress of Vienna*; *France*; also *Concert of Powers.*

Concordat (*kŏn-kôr'dăt*), **French.** An agreement entered into in 1801, but abrogated in 1905, between Napoleon and the pope, providing for the re-establishment of the French Catholic Church, which had been disrupted during the Revolution. Roman Catholicism was declared to be the religion of the majority of the French nation. It was agreed, among other provisions, that bishops were to be nominated by the government, but consecrated by the pope. The nomination of parish priests was vested in the bishops, the government having a right of veto. The state undertook to see that adequate stipends were provided for the clergy, to replace the ancient revenues which had been confiscated during the Revolution. See *France.*

Concordat of Worms. The agreement reached in 1122 between the German emperor, Henry V, and the pope upon the old dispute over the appointment and investiture of bishops. It provided that bishops should be elected by the clergy and consecrated by the pope, but that the emperor might veto any election, since he was to invest the bishop with the episcopal lands. See *Germany.*

Condottieri (*kôn'dôt-tyâr'ē*). Soldiers of fortune who hired themselves out to the various petty states of Italy during the wars of the 14th and the 15th century. Their contests came to be bloodless, because each side wanted only to take prisoners for the sake of ransom money to be exacted.

Confederation of the Rhine. A league of German states, at first chiefly southern but finally including all, save Prussia and Austria, with Napoleon as "protector," formed in 1806. These states were permitted to absorb many of their smaller neighbors by a process known as "mediatization." They withdrew from the Holy Roman Empire, which then came to an end. Together with the "secularizations" in 1803, which destroyed the independence of 112 ecclesiastical, city, and other small states, the annexations of 1806 marked the beginning of unification in Germany. The Confederation was broken up in 1813 by the defeat of Napoleon at Leipzig. See *France, Germany.*

Congress of Berlin. A congress held at Berlin in 1878, after the conclusion of the Russo-Turkish war. The outcome of the congress was a treaty which modified the terms of the Treaty of San Stefano. Rumania, Serbia, and Montenegro were made independent states, Montenegro also obtaining a port on the Adriatic. The northern portion of Bulgaria was made a self-governing state, under the suzerainty of the Porte, and the southern portion, known as Eastern Rumelia, remained Turkish territory, but under a Christian governor. Austria was to administer Bosnia and Herzegovina; Rumania returned a portion of Bessarabia to Russia, while, in Asia, Turkey ceded Ardalian, Kars, and Batum to Russia. The action of the congress prevented the formation of a strong Slav state in the Balkans and kept Russia out of the Mediterranean. It is of this treaty that Lord Beaconsfield used the famous phrase "We have brought back peace with honor." In 1909 Great Britain, Germany, France, and Russia consented to Austria's annexation of Bosnia and Herzegovina. See *World War I.*

Congress of Vienna, The. The congress of all the sovereigns of Europe, called after the fall of Napoleon by the four powers allied against him. It met in Vienna in November 1814, and completed its work in June 1815, after the final defeat of Napoleon at Waterloo. The general purpose of the congress was to restore all "legitimate" princes and kings, as nearly as possible, to the power they enjoyed before the French Revolution. The interests and desires of nations and peoples had no place in the plans of this great reactionary congress, All republics, old and new, except Switzerland, were given to monarchs. The 12 states of Italy and the 38 of Germany were restored to their old ruling families. Holland, with Belgium unwillingly added.

was made the Kingdom of the Netherlands. Territory west of the Rhine, taken from France, was divided between Bavaria and Prussia. To Austria went Venice in exchange for Belgium. Russia took the kingdom of Poland and also secured Finland from Sweden, which as compensation received Norway (formerly Danish). Prussia, with half of Saxony and land west of the Rhine as her share of the spoils, was set on the road to German leadership. England obtained some colonial territory, including Cape Colony and Ceylon.

The congress took forward-looking action in declaring against the slave trade and holding that navigable rivers flowing through or between different countries should be open to all commerce. It also guaranteed the neutrality of Switzerland.

Conservatives, English. One of the two great political parties of Great Britain. This party has usually been regarded as opposed to radical change or innovation of any character in government, and particularly to the liberal, socializing movements which seek to increase the political power of the masses to ameliorate their conditions, and to mitigate the effects of the uneven distribution of wealth. The party has in the past drawn most of its strength from the so-called "landed aristocracy," and other landed interests of England. It is the direct successor to the Tory party of the 18th and early 19th centuries, the name Conservative having been substituted for the older name Tory soon after the Reform act of 1832. Although the Conservative has traditionally been regarded as the party of reaction, yet it has known how to adapt itself to deep-going changes in the nation. Under Disraeli in 1867 and Salisbury in 1884, it extended the franchise to the great mass of the English people. Under Macmillan in the mid-20th century, it extended social security measures begun by the Liberal and Labor parties and guided the country through the transition from the head of an empire to the leader of a commonwealth of nations.

Constitutions of Clarendon. A body of 16 regulations drawn up at the Great Council summoned by Henry II of England to meet at Clarendon in 1164. These regulations were intended to settle points in dispute between king and clergy. They specified, among other things, that clergy accused of civil crime should be turned over to the civil courts for punishment. Archbishop Thomas Becket refused to sign the document. After Becket's murder, Henry, in 1172, seeking reconciliation with the pope, renounced the Constitutions. But some of their provisions remained in force as permanent gains to the civil power in England. See *England*.

Corn Laws. English laws regulating grain imports. In 1815, in the midst of agricultural and industrial depression following the end of the Napoleonic wars, a Parliament made up of landowners passed a law forbidding the importation of corn (wheat) unless the price should rise to 80 shillings a quarter. The price, however, went down. This law was amended from time to time, to provide heavy import duties whenever the English harvest was good, in order to keep prices up. In 1838 an Anti-Corn-Law League was organized, which worked for the repeal of the corn laws. No action was secured until, under the stimulus of the Irish famine in 1845-46, a repeal bill introduced by the prime minister, Sir Robert Peel, was passed in 1846. This act is an important incident in the long controversy between protectionists and free traders. See *Chartist Movement, England, Ireland*.

Corvée (*kôr'vā'*). Enforced labor on the roads and other public works, exacted from the French peasants before the Revolution. Distinction should be made between the "royal" corvée, which exacted from 8 to 40 days of labor on the high roads, and the "seignioral" corvée, or services claimed by the lords. The latter had nearly disappeared by the 18th century.

Coup d'Etat (*kōō dā'tà'*). There is no English equivalent for this term. It means the sudden overthrow of government by force and the consequent seizure of state and power. (1) The most remarkable example of this in history is the *coup d'état* of Napoleon I. The government of France from 1795 to 1799 was known as the Directory. It had proved corrupt and incompetent. Napoleon, now the idol of France by reason of his successful campaigns, saw his opportunity. With the aid of Abbé Sieyès, a statesman who planned a change in the constitution, Napoleon overthrew the Directory on the 18th of Brumaire (November 9, 1799). The plan of Sieyès was adopted but with drastic amendments dictated by Napoleon. Napoleon was chosen first consul and given the substance of power, his two colleagues being merely consultative. In 1802 he was made consul for life and on May 18, 1804, was proclaimed emperor of the French.

(2) Half a century later a similar *coup d'état* was made by Louis Napoleon Bonaparte, nephew of Napoleon I. Louis conceived the idea that he had a right to rule over France. The revolution of 1848 gave him the opportunity of offering his services to that country. He knew the name he bore was one to conjure with. He became a candidate for the presidency and was elected with an overwhelming majority in December of the same year. He had taken an oath to uphold the Republic. On Dec. 2, 1851, he broke this oath. In the early hours of the morning he had the civil and military leaders who might prove obstacles to his plans arrested. These were afterwards imprisoned or exiled. He next proclaimed martial law throughout France and instituted a plebiscite. The French people were to register their vote on the question of the re-establishment of the imperial dignity. The people proved willing to make the experiment, and on Dec. 2, 1852, Louis Napoleon Bonaparte, having skillfully maneuvered his *coup d'état*, was proclaimed emperor of France under the name of Napoleon III.

Curfew. From *couvre feu*, meaning "cover fire." The famous enactment of William the Conqueror, ordering all persons in the country districts to be in their houses, with all lights extinguished, by eight o'clock in winter and by sunset in summer. It was presumably designed to prevent secret meetings and conspiracies directed against the king among the Saxon element of the population.

Danzig (Gdansk). This Baltic port of Poland was long a free city. It was annexed by Russia in 1793. After World War I, it was made a free city to provide Poland with access to the Baltic Sea. Hitler opened World War II in 1939 by invading Danzig. In 1945, under the Potsdam agreement between Russia, the United States, and Britain, it passed to Poland. The Poles changed its name to Gdansk.

D-Day. The opening day of a military operation, from which other days are reckoned,—D-day+1, D-day+2, etc. Notably, the day of the Allied invasion of Normandy, June 6, 1944.

Declaration of London. A set of rules formulated by an international conference at London in 1909, designed to govern the naval prize court established at The Hague in 1907. The Declaration was never accepted by a sufficient number of nations to put it in force. At the outbreak of World War I, Great Britain announced that the Declaration would be adhered to by the Allies. But under the stress of actual war conditions the provisions of the Declaration were disregarded.

Declaration of Paris. A formal statement of rules governing naval warfare, drawn up by the powers that signed the Treaty of Paris in 1856 after the close of the Crimean war. These rules abolished privateering; established the protection of enemy goods, except contraband, by a neutral flag, the protection of neutral goods, except contraband, by an enemy flag; and declared that blockades, to be

binding, must be effectively maintained by naval force. The U.S., not having a strong navy, maintained that in war she would be dependent upon privateers, and did not adopt the declaration.

Detente. Detente is a French word meaning the relaxation of tension. During the Nixon administration, 1972, detente was used to describe the U.S. foreign policy toward the U.S.S.R.—an end to the Soviet-American rivalry and the beginning of peaceful coexistence between the two superpowers. Since that time detente has become an international term for cooperation between nations.

Divine Right. The patriarchal theory or doctrine that neither kings nor their heirs for any reason whatsoever can forfeit their right to the throne and to the obedience of their people. Under this theory, the king is the direct representative of God and can do no wrong. This doctrine was promulgated and reached its climax in England in the Stuart times, but it was set aside at the accession of William III as king of Great Britain and Ireland in 1688.

Domesday Book. A book containing a written synopsis in Latin of the census of the population, lands, and livestock of England, compiled under the direction of William the Conqueror and completed in 1086. The work forms the most valuable existing source of facts about early English history.

Draco, Laws of. In the latter part of the 7th century B.C., the people of Athens, suffering under the unjust administration of justice by the ruling class of nobles, demanded a written code. An Athenian named Draco was employed to draw up such a body of laws. The severity of these laws gave rise to the saying that the Draconian code was written, "not in ink, but in blood."

Drang nach Osten. A German phrase meaning "push toward the East." It was originally applied to the eastward extension of German power over Slavic and Baltic territory. Its most important meaning, however, was the steady extension of German and Austrian influence in the Balkans and in Asia Minor which brought on World War I.

Dreyfus (*drā′füs′*) **Affair.** The imprisonment and persecution of Alfred Dreyfus, member of a wealthy Jewish family and an officer on the general staff of the French army. He was charged in 1894 with revealing military secrets to a foreign government, condemned, and sent to Devil's Island for life. New evidence was discovered in 1896, pointing to another officer, Esterhazy, as the real traitor. A new court-martial in 1899 again condemned Dreyfus, but this time to only ten years' imprisonment. President Loubet gave him a full pardon. The Court of Cassation reviewed the case in 1906, declared the court-martial verdict in error, and Dreyfus was restored to the army and promoted.

Druids (*drōō′ĭdz*). The powerful order of priests and judges who ruled the Celtic peoples of Gaul, Britain, and Ireland. The druids gathered youths about them for oral instruction, as they never committed their secret lore to writing. The oak and the mistletoe were sacred among the druids, and their ceremonies were frequently performed in oak groves. They used their influence against the Romans, but they were finally driven to the island of Anglesey and subdued in A.D. 78.

Dual Monarchy. The name used to describe the organization of the empire of Austria-Hungary from 1867 to 1918. The two states stood on a plane of complete equality, the emperor of Austria being king of Hungary. Although each had its own parliament, there was a joint ministry of three departments—foreign affairs, war, and finance.

Dukhobors (*dōō-kŭ-bôrz′*). A Russian religious sect, founded about the middle of the 18th century at Kharkov. Their principal tenet is that Christ was only human, not divine, and that at certain periods He reappears in mortals. They reject the need of rulers, priests, or churches, and have no confession, images (*icons*), or marriage ceremonies. They are opposed to all violence and refuse to make use of the labor of animals. Driven out of Russia, many of the Dukhobors emigrated to western Canada. Conflict with authorities led part of this group to migrate to Paraguay.

Eastern Question. A name given to the political problems raised by the gradual dissolution of the Turkish Empire in Europe from about 1822 to 1922. Russia aimed to secure Constantinople (Istanbul). She fought two wars for it. In the first (Crimean, 1853-56), she was defeated by France and England. After the second (Russo-Turkish, 1877-78), while victorious, she was balked by the other powers. German ascendancy in Turkey began in 1889 and ended when the two nations suffered defeat in World War I. The prize of Istanbul went to none of the great powers. It remained Turkish, but was placed under control of an international commission. This commission's control ceased in 1936.

East India Company, British. "The Governor and Company of merchants trading to the East Indies," chartered in 1600, became in time incorporated with several other important companies and in 1660 was known as "The United Company of Merchants Trading to the East Indies." It is usually referred to as the British East India Company.

In 1612 it obtained from the rajah of Delhi the privilege of establishing a factory at Surat. By a charter of Charles II in 1661, it was empowered to sign treaties, make peace or war with infidels, erect fortifications, acquire territory, and exercise civil jurisdiction. In 1668 it secured a grant of the Island of Bombay, and in 1675 established a factory in Bengal which paved the way to the foundation of Calcutta. A dispute with the rajah of Tanjore in 1749 resulted in a series of territorial acquisitions which became the nucleus of the British Empire in India. A board of control was eventually set up by Parliament in 1784, and in 1858 the company gave over the reins of government to the British crown. See *England, India.*

East India Company, Dutch. A company formed by the union of several small trading companies, March 20, 1602. The government granted it a charter, by which it was given the monopoly of trade on the farther side of the Strait of Magellan and of the Cape of Good Hope. It was also given the right to establish factories, build fortresses, employ soldiers, and make alliances in the name of the states-general. In 1619 it established the colony of Batavia in Java; within less than half a century it became the principal trading power in Ceylon, Sumatra, and Borneo, and possessed flourishing colonies in South Africa. In 1795 the company became insolvent, and its territories were handed over to the state.

Elamites (*ē′lăm-īts*). The ancient people who inhabited the plateau and plain east of the lower Tigris and north of the Persian Gulf. The name is derived from the Assyrian word for "highlands." The race to which they belonged is not known. They maintained a long struggle against the Babylonians and Assyrians. The latter finally subdued the Elamite state in 642 B.C. Later references to Elam are uncertain, the word sometimes meaning Persia.

Electors. In the Holy Roman Empire, a body of German princes, originally seven in number, with whom, from the 13th to the beginning of the 19th century, rested the election of the emperor.

Emancipation Act. For many years the English courts of law strongly held that slavery should not be allowed to exist in any part of the British dominions and that in tolerating it the prestige of England suffered. Two of the greatest pleaders in the cause of the slave were Sir Thomas Buxton and Zachary Macaulay, father of the historian. In 1833, Colonial Secretary Stanley came

into office. A man of great ability and ardent temperament, he set to work to master the details of this crying injustice. In the space of three weeks he introduced into Parliament a bill for the complete abolition of slavery, which was immediately passed. All children under six and those born after the passing of the act thenceforward were free. All others ceased to be slaves, but were to remain as apprentices to their masters for a period of twelve years. The slave owners were indemnified for their loss in the sum of $100,000,000. Though they showed dissatisfaction with this amount, they were forced to accept it. The system of apprenticeship proved, after four years, to be unsatisfactory and so was abandoned. See *Slavery*.

Emigrés (*ā'mē'grā'*). The name given to the French aristocracy, or, more accurately, to the partisans of the *ancien régime*, or royalists, who were forced to fly from France during the French Revolution. The émigrés, in order to crush the Revolution, appealed to other European powers to send armies into France. For this, the Legislative Assembly and the Convention passed measures of reprisal against the émigrés, whereby their lands and estates became forfeit to the Republic. The term has been applied also to those who fled the Russian and other revolutions in the 20th century, particularly if they belonged to the aristocracy.

Entente Powers or **Triple Entente** (*ăn'tänt'*). England, France, and Russia, who, before the opening of World War I, had concluded an *entente* or "understanding" among themselves with respect to a common defensive attitude toward the Triple Alliance,—Germany, Italy, and Austria. This Triple Entente was not an alliance. It was composed of two "ententes." The first was negotiated in 1904 between England and France, in order to bring to an end controversies chiefly in relation to Egypt and Morocco. The second was between England and Russia, in 1907, and centered in Asiatic questions, marking out for the two powers spheres of interest in Persia. France was already bound to Russia by a military alliance. For this reason, when Germany declared war against Russia in 1914, France was necessarily involved. The obligations of England, on the other hand, were principally moral. See *Triple Alliance, World War I*.

Estonia. This Baltic province of Russia enjoyed a period of independence between World War I and World War II. Prior to 1920, it was ruled successively by Danes, Germans, Swedes, and Russians. In 1940 Russia concluded with it a treaty of "mutual assistance," the implementation of which extinguished Estonia's independence. The Germans held it briefly in World War II.

Fabian Society of Socialists. One of the most important socialistic societies in England, organized in London in 1884. It derives its name from Fabius, the Roman general, who hoped to conquer "by delaying," and supports meliorative tendencies rather than revolution.

Fascism (*fash'iz'm*). A former political party and governmental regime of Italy. Founded by Benito Mussolini at Milan in 1919, the movement was inspired by an exalted patriotism. Its members banded themselves together to crush communistic outbreaks and other disruptive factors in Italian life. Its expanding influence enabled Mussolini, at the head of his armed followers, to take control of the Italian parliament on October 28, 1922. The party's control of the government was maintained by drastic action. It came to an end with Italy's defeat in World War II. The term was generalized to describe movements seeking to safeguard the capitalistic system by establishment of a corporate state.

Fashoda (*fă-shō'dă*) **Question.** Commercial and colonial jealousies between France and England in 1898 led to a French general's hoisting of the French ensign over Fashoda, which Great Britain regarded as within her particular zone of influence. English armies had for two years been engaged in a campaign against the Khalifa for the recovery of the Sudan. Their commander, General Kitchener, invited Marchand to withdraw. Marchand refusing, the matter was referred to London and Paris. France acquiesced in the wishes of England. On April 8, 1904, an agreement was signed between the two countries, each acknowledging the other's rights in Morocco and in Egypt. This friendly understanding came to be known as the *Entente Cordiale*. See *Entente Powers*.

Fenians. The members of an Irish revolutionary society, started in Paris in 1848. Their avowed object was the fomenting of disturbances in Ireland, to make the government of that country by England impossible. The leader was James Stephens. The Fenians in the United States attempted raids into Canada in 1866, 1870, and 1871. In 1867 a general rising in Ireland was planned. These projects were all anticipated or promptly suppressed.

Feudalism. The system of land tenure and personal relationships prevailing throughout Europe especially from the 9th to the 13th century. Its activating cause was the need of protection, which could no longer be secured by governmental authority. The base of the structure was the fief, a body of land which a tenant held from his lord who protected him in return for certain feudal services, such as aid in war. The tenant was thus also a vassal. The lord exercised judicial and many other rights over his tenants, who often became virtually his subjects. The tenant might also, if holding a large tract of land, grant parts of it to others, who would be his tenants and vassals and to whom he stood in the relation of lord.

Field of the Cloth of Gold. The meeting place of Henry VIII and Francis I in the valley of Ardres on the border of the territory of Calais. This meeting in 1520 was arranged by Francis to detach Henry from his Spanish alliance. The name arose from the magnificance of the display on both sides. No political result followed.

Fifth Column. A term used to describe persons ready to cooperate with an aggressor against the country of which they are citizens or residents. It obtained currency from a remark of General Franco, Spanish insurgent leader, as he was advancing in 1939 on Madrid with four converging columns in the final action of the Spanish civil war. He declared that he was attacking with four columns outside the city and with a "fifth column" within the city.

Flagellants (*flăj'ĕ-lănts*). A sect which appeared in Europe during the middle ages, notably in Italy in 1360, and in Hungary and other countries during the terror occasioned by the Black Death in 1348. They looked upon scourging as the only means of avoiding divine punishment for sin. See *Black Death*.

Flodden Field. Name of a battle fought near the hamlet of Flodden in Northumberland, Sept. 9, 1513, between the Scots and the English, in which the Scottish king, James IV, was defeated and slain by the earl of Surrey.

Franco-Prussian War. The conflict between France and Prussia in 1870-71. The immediate occasion of the war was the election of a Hohenzollern prince to the throne of Spain. The chief military events were the siege of Metz and the siege of Strasbourg, in August and September 1870; the fall of Sedan on September 1, 1870; and the siege of Paris, September 19, 1870 to January 28, 1871. After the fall of Sedan, a republic was proclaimed at Paris, and a provisional government undertook the defense of the city. The close of the war saw the founding of the new German Empire. See *Alsace-Lorraine, France, Germany*.

Francs-Tireurs (*frăN'tē'rûr'*). As the name implies, an independent band of "free-shooters," composed of French peasants who at first fought alone a guerrilla warfare against the Germans in the Franco-Prussian war of 1870. When captured, they were usually shot by the enemy as brigands. Later in the campaign they were organized by the French military authorities and used as a corps of detached light troops engaged in forays, skirmishes, and such minor actions.

Freedom of the Seas. This phrase means, in general, the right of the ships of any nation to free use of the highways of the sea. In particular it has come to mean: (1) that the jurisdiction of a government extends to a distance of three nautical miles beyond its coast line and no farther; (2) that neutral ships are not liable to capture on the high seas by belligerents in time of war; (3) that, in time of war, private property, unless contraband or destined for a blockaded port, is not liable to seizure. See *World War I*.

Free Imperial Cities. Certain towns in Germany that owed allegiance to no sovereign prince except the emperor. They exercised sovereign powers within their own limits and sent representatives to the Imperial Diet. In 1790 they were 51 in number. Until the dismemberment of the German Empire at the close of World War I, Lübeck, Bremen, and Hamburg still retained the privilege of sending representatives to the Reichstag and the Bundesrath. Bremen and Hamburg continued each to be a "free state and city."

Fronde (*frôNd*). The name given to the civil war which broke out in France, 1648–53, between the party of the court (Anne of Austria and Mazarin) and the parlement of Paris. The Fronde originated in the deplorable financial policy of Mazarin and passed through two phases. The first was known as the Old Fronde, in which the parlement, allied to Condé and Cardinal de Retz, played the principal rôle. The most notable incidents under its short régime were the arrest of Counselor Broussel, the setting up of barricades by the people of Paris, and the withdrawal of the court to Saint Germain. During the second phase, with the title of the Young Fronde or Fronde des Princes, Condé, Beaufort, and Madame de Longueville, with the secret support of Spain, gave battle to the royal troops under Turenne at Bléneau and Porte St. Antoine. Turenne proved superior on both occasions, and the revolt was crushed in 1653. The Old Fronde lasted from 1648 to 1649; the Young Fronde, from 1649 to 1653. The word *fronde* means a "sling," used sometimes by the small boys of Paris against the police. The adversaries of Mazarin had been called *frondeurs*, or "slingers."

Geneva Conventions. Agreements made by representatives of European powers at Geneva, beginning in 1864, by which more humane regulations were adopted covering wartime sick and wounded. The 26 signing nations agreed to respect the wounded, the neutrality of hospitals, and other humanitarian rules. In 1868, a second conference extended these principles to naval warfare. These early agreements, were closely linked with the founding of the International Red Cross. Extensive revisions occurred in 1906 and 1907. In 1929, and again in 1949, further agreements were signed for the protection of civilian victims of war. By 1949, 59 nations had signed the articles. During the Korean conflict, all the powers involved declared themselves bound by the conventions, whether signing the agreements or not.

Germany, Unification of. The North German Confederation, which embraced the 22 states north of the river Main, was the work of Bismarck. The inclusion of the south German states was yet necessary to the perfect unification of Germany. Since Napoleon III was known to be averse to this plan, Bismarck deemed a war with France a necessary contingency. In this instance, it would seem "the wish was father to the thought," for on July 5, 1870, the rest of Europe woke to the fact that France and Prussia were at war. Germany emerged as victor from the series of campaigns. While the war was being waged, negotiations had been carried on between Prussia and the south German states. Accordingly, treaties were signed and the confederation widened so as to include all the German states. Thus was brought about the complete unification of Germany, and Bismarck's lifelong dream was realized. Berlin became the capital of a federal empire, and on Jan. 18, 1871, in the royal palace of Versailles, William I was proclaimed emperor of Germany.

Golconda. A ruined city in the Nizam's dominions, seven miles northwest of Hyderabad. It is celebrated for its fortress and for the mausoleums of its ancient kings. The diamonds cut and polished in Golconda were once world renowned. From 1512 it was the seat of a powerful government until it was taken by Aurungzebe in 1687 and made a Mogul province. See *Moguls*.

Golden Bull (Germany). So called from the golden seal with which it was stamped. The Golden Bull was an imperial edict issued in 1356 by the emperor Charles IV, which fixed the form and places of the imperial election and coronation. It also determined the privileges and duties of the electors. This electoral constitution continued unaltered until the extinction of the Holy Roman Empire in 1806.

Good Parliament. A Parliament of Edward III which met in 1376. The Commons refused to grant supply till an account of receipts and expenditures had been placed before them. Edward's brother Lancaster sought to intimidate the Parliament but failed. The Commons secured a new Council, from which Lancaster was debarred and in which William of Wykeham was included. They then proceeded to impeach, before the House of Lords, Lyons and Latimer on the charge of embezzlement of the king's revenue. Both were sentenced to imprisonment on the charge. These two cases form the first instance of the accusation of political offenders by the Commons before the House of Lords.

Guelphs (*gwĕlfs*) and **Ghibellines** (*gĭb'ĕl-ĭnz*). The names of two celebrated political factions in the Middle Ages. The Guelphs were the popular party in Italy, and ranged on the side of the pope. The Ghibellines formed the imperial and aristocratic party, and were opposed to the Guelphs. In 1140 the two factions engaged in civil war, in which the Guelphs were defeated in the battle of Weinsberg.

Guillotine. Although decapitation by means of a falling weighted knife was a mode of punishment used by some European countries in Medieval times, it is commonly associated with France and the Reign of Terror. The instrument used for this purpose during the French Revolution gets its name from a well-meaning physician, Dr. Guillotin, who wished to make the process of execution swift and comparatively painless. The historical case of Marie Antoinette and the fictional incident climaxing Dickens' *Tale of Two Cities* have made the guillotine stand out as a dramatic symbol for the cruelty of the time.

Gunpowder Plot. This was a plot engineered by a Catholic named Robert Catesby, in 1604, to blow up king, lords, and commons at the opening of Parliament. Both the Catholics and the Puritans of the time had appealed to James I for better treatment. They were being fined for recusancy, that is, for refusing to attend the services of the established form of worship. James remitted the fines for recusancy, but banished the Catholic priests from London. Thereupon, Catesby determined upon destroying the powers that dealt so harshly with his coreligionists. He communicated his plans to Guy Fawkes, a cool and intrepid soldier in Flanders. Fawkes favored them and came to England. By accident, the conspirators found that a

cellar ran beneath both houses of Parliament. Into this they managed to convey barrels of gunpowder, and the mine was laid for the second session of Parliament on Nov. 5, 1605. However, the plot was doomed to failure. One of the conspirators in fear betrayed the secret, and Fawkes was seized in the very act of setting the fuse to the powder. He, with those of his companions who were captured, was forthwith executed, and the persecution of the Catholics waxed stronger than before. See *England.*

Habeas Corpus Act. The Latin term is an injunction, meaning "Have thou the body" (in court). The act was passed by the Parliament of England during the reign of Charles II, 1679. The "habeas corpus" is a common law writ, or mandate, issued by a judge on the petition of some friend of an accused person detained in prison or in any other way deprived of liberty. It calls upon the jailer to bring such a person actually into court at a specified time, in order that his case may be examined and judgment passed. Moreover, any accused person held in prison too long without a hearing can claim a writ of habeas corpus to be issued in his behalf, in order to force his accusers to show cause why he should be detained longer in custody. The habeas corpus acts of the United States and of Canada follow lines similar to those of the English statute.

Hague Peace Conferences. Meetings of representatives of leading nations of the world, to consider means for arresting the danger of war and for mitigating the burdens of armaments. Two conferences have been held at The Hague in Holland. The first was convened, at the suggestion of Czar Nicholas of Russia, in 1899. It formulated regulations for more humane conduct of warfare and established an international tribunal to which nations might submit their disputes for arbitration. The second Hague Conference met in 1907, at the suggestion of the United States. This Conference enlarged somewhat the work of the first Conference. But neither body was able to adopt any resolution either for disarmament or for limiting of armaments.

Hanseatic League. A federation of northern German cities, formed in the 13th century for mutual protection and assistance, particularly in trade. The immediate cause of this famous and powerful organization was the insecurity of trade routes. The princes and states of the time were unable to afford protection against the pirates and robbers on sea and land. The alliance of the towns of Hamburg and Lübeck, about the middle of the 13th century, is regarded as the beginning of the confederacy, to which the name *Hansa*, meaning "league," was later applied. The organization at the height of its prosperity, in the 14th and 15th centuries, included about ninety cities and towns. It passed out of existence about the middle of the 17th century. See *Venice and the Hanse.*

Hearth Money. A tax laid in England on hearths. It was first levied in 1663. Each hearth in every house that paid church and poor rates was taxed at the rate of two shillings. This tax, known also as chimney money, was repealed in the reign of William and Mary, 1689.

Hegira or **Hejira** (*hĕj'ĭ-rà*). An Arabic word meaning "departure." It is used to designate the flight of Mohammed from Mecca to Medina in 622. Mohammed sought to persuade his countrymen to forsake idolatry. They rose in anger against him, and he was forced to flee for his life to Medina. The Mohammedan calendar is dated from this flight, as that of the Christians is dated from the birth of Christ. See *Arabia, Arabians.*

Heptarchy. A government of seven rulers; a union of seven territories. In Saxon times in England seven small kingdoms or principalities were established, known as Northumbria, East Anglia, Mercia, Kent, Sussex, Essex, and Wessex. The number of these tribal divisions was not constant. Feuds and struggles between rival princes at times merged one principality into another. Egbert, who was king of the West Saxons, 802–839, is said to have made himself Bretwalda or overlord of the British. It was this, no doubt, that gave the 16th century historians the idea that the seven Angle and Saxon kingdoms were really a monarchy ruled by one supreme king; hence they introduced the word *heptarchy* into their writings to convey this conception. Though the designation is questionable, it seems to have been preserved as a matter of convenience. See *England.*

Hindenburg Line. A system of elaborate entrenchments on the western front in World War I. It was established by Hindenburg, commander in chief of the German field forces, after the fighting on the Somme in 1916. These entrenchments took approximately the shape of a crescent whose arc swept from the North Sea, between Nieuport and Westende, until it reached the banks of the Aisne river on the south. At the northern horn of the crescent stood what was known as the "*Wotan*" *line,* the middle of the crescent was occupied by the "*Siegfried*" *line,* and at the southern horn was placed the "*Albrecht*" *line.*

The Allied front opposed to the Hindenburg line was divided into three sections: a British front from the North Sea to the Oise river, a distance of 125 miles; a French front from the Oise to Verdun, about 150 miles; and an American front from Verdun to the Swiss frontier—the latter known as the Lorraine front. The supposedly impregnable German defense was first penetrated by Australian troops, May 3, 1917. On September 29, 1918, the Siegfried line was broken at the famous tunnel sector, near Cambrai, by American troops acting with British and Australian forces. See *World War I.*

Hinterland Doctrine. After the explorations of Livingstone and Stanley, Africa no longer remained an "unknown land." Upon various pretexts, European powers appropriated large areas to themselves. Germany, to make secure and to enlarge her new acquisitions, enunciated in 1883 a doctrine by which the possession of a stretch of coast line carried with it the right to the territory lying inland. This doctrine maintained that no other country could annex such territory.

Hittites. A people primarily of Indo-European stock. Their original home was in central Asia Minor, whence they gradually pushed southward, invading Babylonia about 2000 B. C. and conquering northern Mesopotamia, Syria, and Palestine. In the 14th century B. C., they were driven from Palestine by the Egyptians, with whom, after an indecisive battle at Kadesh in Syria, they concluded a treaty, the oldest written treaty in history. Hittite dominion over Syria lasted until the 8th century B. C., when this country too was conquered by Assyria. A century later they had disappeared from history. Little was known about the Hittites until quite recently. Excavations, begun by Winckler, a German scholar, in 1905, at Boghaz-Köi on the Halys river, the site of the ancient Hittite capital, yielded about 10,000 baked clay tablets, with writing practically identical with Babylonian cuneiform, but in an unknown language. The key to this was discovered by Hrozný, a Czechoslovakian Assyriologist, in 1915.

Hohenstaufen Dynasty. The line of emperors who ruled Germany from 1138 to 1254. They were distinguished for patronage of commerce and the arts. The greatest of the family were Frederick Barbarossa (1152–90) and Frederick II (1215–50).

Hohenzollern Family. A family of German princes tracing descent from Thassilo, count of Zollern, who, in the 8th century, founded a castle on the Zollern hill in the Swabian Alps. In 1415 Frederick VI of the younger line of Hohenzollern

was made elector of Brandenburg. He thus became the founder of the former royal house of Prussia. See *Germany, World War I.*

Holy Alliance. An alliance formed between Russia, Austria, and Prussia in September 1815, by which the three sovereigns undertook that for the future their policy, both domestic and foreign, should be guided solely by the precepts of the Christian religion. In reality, it was regarded by those powers who were asked for their approval as a huge farce and one of dubious taste. But the name was too good to be ignored; and Russia, Austria, and Prussia came to be known as the "holy allies." The alliance aimed at stemming the tide of political liberty, set flowing by the French Revolution. The threatened interference of this alliance in the quarrel between Spain and her American colonies provoked the enunciation of the Monroe Doctrine in 1823. See *Monroe Doctrine.*

Holy Sepulcher, Knights of the. Members of a military order whose founding was traditionally ascribed to Godfrey de Bouillon, one of the leaders of the First Crusade His followers were the first to enter Jerusalem when it was captured by storm in 1099, and he was named ruler of the city. Actually, however, the order goes back only to 1496, when it was instituted by Pope Alexander VI to help guard the pilgrims who, in great numbers, visited the Holy City. Although Jerusalem was ruled by the Turks, Christian pilgrims were not unwelcome as tourists who spent money. But there were plenty of hazards against which protection was needed.

Hudson's Bay Company. A British joint-stock association chartered in 1670 by Charles II. It was given vast tracts of territory and exclusive trade rights throughout what is now Canada. It engaged exclusively in the skin and fur trade with the North American Indians. The company spread a chain of forts and trading posts from the Atlantic to the Pacific and exercised complete legislative and executive power within these precincts. By the Indians it was looked upon as more powerful than any nation. It played a prominent part in the disputes between the United States and Great Britain over the northwest boundary. In 1869 it sold its territorial rights to the Dominion of Canada, but it still operates as a trading company. See *Canada.*

Huguenots (*hū'gĕ-nŏts*). The name given to the French Protestants in the 16th and the 17th century. Huguenot is said to be derived from the German word *Eidgenoss*, a "confederate by oath," or perhaps from the name of Hugues, one of their leaders. Under Francis I and his successors, the Huguenots were welded together in a kind of politico-religious unity. Under Condé and Admiral Coligny they fought several wars against the Catholics. When, by the revocation of the Edict of Nantes, they were deprived of religious liberty, they left France in vast numbers. Thousands of them emigrated to England, Holland, and other Protestant countries. Many settled in America, especially in South Carolina.

Hundred Years' War. The name given to the series of wars between England and France from 1337 to 1453, due in part to the claim of the English kings to the French throne. The English won three great battles,—Crécy, 1346, Poitiers, 1356, and Agincourt, 1415,—but finally lost all their French possessions except Calais, which they retained till 1558.

Hussites. The followers of John Huss, a native of Bohemia and rector of the University of Prague, 1402-03. The writings of Wiclif had attracted him, and he spread the Wiclifite doctrine among the people. He attacked the abuses of the clergy and expressed opposition to the pope's supremacy. Alexander V excommunicated him, but this sentence failed to quench his ardor. He was finally cited before the Council of Constance, which condemned him as a heretic in 1415. The emperor Sigismund, who had granted Huss safe-conduct, violated his word and allowed him to be burned at the stake. The flames that burned Huss set all Bohemia on fire. The Hussites looked upon him as a national hero and made his martyrdom the signal for rebellion against the Holy Roman Empire. Under the leadership of John Ziska, they began a long series of wars against Sigismund and his successors, which came to an end only in the year 1471. A part of the Hussites returned at length to the Catholic faith. From those who remained Protestants the groups of Bohemian Brethren and Moravian Brethren later developed.

Hustings. The name of a court of limited jurisdiction which at one time sat in London. Before the English Ballot act of 1872, this court was the place where members of Parliament were usually nominated, the method of nomination being by a speech made from the platform of the court. From this custom, the term "hustings" came to be applied to any stump speech or organized canvassing for votes in a political campaign.

Imperial Federation. The policy within the British Empire of closely uniting the mother country and the colonies for defense and trade, while at the same time maintaining the self-governing character of each colony. The Imperial Federation League was formed in 1884, and in 1897 the practice of holding conferences of prime ministers and delegates from the colonies in London was begun. The united action of the colonies at the outbreak of war in 1914 is pointed out as a result of this policy.

Inquisition. Tribunals established in the middle ages and in still later times, for the seeking out and for the punishment of heretics, were designated by this name. The condemnation of heretics was entrusted to the Lombard bishops in 1183 by the Council of Verona, which may be said to have laid the foundation of the Inquisition. If a heretic refused to renounce his heresy, the ecclesiastical authorities handed him over to the civil authorities to be dealt with. This institution was first put into effect in Languedoc against the Albigenses. It then spread, little by little, over the Christian world. In France, however, it played a small part. Spain and Italy were the countries in which the majority of cases were brought before the papal inquisitors. Used during its earlier stages against secret Judaism and secret Mohammedanism, it served also to repress all those who dissented from Catholic doctrine.

Viewed in the eyes of the 20th century, the Inquisition was the most intolerant, biased, and unjust institution in history. In view of the intimate union of Church and State, however, which formerly existed, heresy was naturally regarded as a crime punishable by the State and with the severe penalties then customarily inflicted on criminals of every type. The number of those put to death by the inquisitorial courts has often been exaggerated. The sentences passed by the courts tended in later centuries to take the form of excommunication.

Iron Curtain. This phrase became current after Winston Churchill used it in an address delivered at Fulton, Mo., in March 1946. He referred to the barrier of secrecy and intimidation with which Soviet Russia had shut off herself and her satellites in Eastern Europe from the West.

Italia Irredenta (*ē-täl'yä ĕr'rā-dĕn'tä*). A name meaning "unredeemed Italy." It was applied after 1870 to Trieste and the Trentino, territories mainly Italian in population but under Austrian rule. The peace treaty of 1919 gave these territories to Italy.

Italy, Unification of. Italy was being torn to pieces by conflicting political parties, each of which sought to bring about her unification in its own especial way. In 1849 Victor Emmanuel succeeded to the throne of Sardinia. The unification of Italy was also his dream. He chose Cavour, one of the most distinguished statesmen of Europe, to be his prime minister. Cavour set to work to bring about the realization of his master's vision. In 1854 the Crimean war broke out, and at once Cavour signed

an alliance with France and England and sent troops to their aid. In 1859 Victor Emmanuel managed to bring about a war with Austria. France came to his aid and helped to defeat the Austrians at Magenta. Lombardy was then ceded to Victor Emmanuel by Austria. In 1860 Parma, Modena, and Tuscany declared for the expulsion of their respective rulers and for annexation to the kingdom of Sardinia, which accordingly was brought about. The Romagna repudiated the temporal rule of the pope and in due course was joined to Sardinia. The Two Sicilies, the Marches, and Umbria next followed. In 1861 Victor Emmanuel declared himself king of Italy. In 1866 he joined Prussia in a new war against Austria and secured Venetia. In 1870 the complete union of Italy was effected by the taking of Rome, the last of the papal territories. See *Italy*.

Jacobins (*jăk'ô-bĭnz*). The most famous of the political clubs of the French Revolution, so called because originally its members met in a Jacobin monastery. They were the most radical of all the revolutionists. The political party of which the Jacobins were members was the Mountain. From its use at this period, the name Jacobin has come to denote any extreme radical wing of politics.

Jacobites (*jăk'ô-bīts*). A name given to the adherents of James II after his forced abdication, and in general to the supporters of the claim of the Stuarts after the revolution of 1688. See *England*.

Jameson Raid. Various causes led up to this notorious raid. The uitlanders, or foreigners, at work in the gold mines of the South African Republic, sought equal rights of citizenship with the Boers. The Boers, in turn, suspected British control, north and west of the Transvaal, and likewise rejected the British claim of suzerainty. Rhodes, premier of Cape Colony, planned to place the Dutch states under British rule, and connived at a conspiracy of the uitlanders to raid Johannesburg. To this end he sent troops under Jameson to take that city. The Boers routed the invaders, captured Jameson, and handed him over to the British authorities, who, disclaiming the raid, sentenced Jameson to six months' imprisonment. See *South Africa*.

Janizaries (*jăn'ĭ-zâ-rĭz*). A military force established in the 14th century by the Turkish sultan Orkhan and further developed by Amurath I. They were recruited from Christian youths captured in war, who were brought up in Mohammedan faith and trained to arms. It was their boast that they had never fled in battle.

Jingoes. The nickname given in England to the supporters and enthusiasts of Lord Beaconsfield, who sent a fleet to Turkish waters to oppose Russia's advance on Constantinople in 1878. Originally a jocular oath, "By Jingo" came into popular vogue when used by "The Great Macdermott" in a famous music hall song.

Junius, Letters of. This remarkable series of political letters, to the number of 69, were written under the mysterious pen name of "Junius," and appeared at intervals between Jan. 21, 1769, and Jan. 21, 1772, in the pages of the *Public Advertiser*, the most popular newspaper in Great Britain at the time. Masterly in style, they attacked all the leading characters of the government, not excepting royalty itself. The authorship of the "Letters of Junius" has been attributed to no fewer than 50 different persons, but it is now generally accepted that they were written by Sir Philip Francis.

Junkers (*yŏŏng'kĕrz*). The name applied to the arrogant class of Prussian landowning nobility. From their feudal ideals, the Prussian army officer took his peculiar haughty air of superiority.

Jutland, The Battle of. The decisive naval engagement of World War I, fought in the North Sea on the night of May 31–June 1, 1916. The English losses were 6014 killed and drowned and 674 wounded. The German losses were reported to be 3076, of which number 2000 were drowned. But the German navy undertook no further action during the war chiefly because of the destruction of morale resulting from this battle.

Ket's Rebellion. During the reign of Edward VI, the gentry had enriched themselves at the expense of both the clergy and the poor, whose claims had been contemptuously set aside. A tanner named Ket raised the standard of rebellion on Mousehold hill near Norwich, and commanded his followers to pull down the enclosures on all estates. The earl of Warwick, supported by German and Italian mercenaries, quelled the rising with great slaughter. Ket, with several other leaders, was captured and hanged.

Knights Templars. A military and religious order founded at Jerusalem in 1118 for the protection of pilgrims and for the protection of the Holy Sepulcher. It was confirmed by Honorius II in 1128. The members took their name from the site of Solomon's temple, on which their headquarters were located. They were bound by vows of chastity and poverty. After the conquest of Palestine by the Saracens, the Knights Templars spread over Europe and received donations in wealth and lands. They soon became a great political power; consequently, their enemies accused them of heresy and other crimes. Finally the order was proscribed by Clement V in 1312, and its property was confiscated.

Kulturkampf (*kŏŏl-tōōr'kämpf'*). "Battle for civilization." The name given by Virchow to the struggle between the German government and the Catholic Church which arose about 1870. Bismarck regarded the Catholic Church and its Center party as an anti-national influence, and the contest within the Church over papal infallibility embittered the feeling. The Jesuits were expelled, and the so-called Falk or May laws, 1873–75, resulted in the suppression of religious orders. Most of these laws were repealed in 1878–87, when Bismarck wished the support of the Catholics against socialism.

Labor Party, British. This party was organized in 1906. In 1923, with passive support from the Liberals, it took over the government, under J. Ramsay MacDonald as premier, but fell when Liberal support was withdrawn the next year. The weakness of the Liberals made it the leading opposition party. It returned to power again in 1929, but a financial crisis forced it to yield to a National ministry, mainly Conservative, in 1931. Its leaders entered Winston Churchill's war ministry in 1940. At the general election of 1945 it returned under Clement Attlee and carried out policies of a definitely socialistic character until defeated in 1951.

During the next decade the party was rent by dissention between policies of the left and right, championed respectively by Aneurin Bevin and Hugh Gaitskell. Death having removed these leaders, Harold Wilson led the party to victory at the polls in 1964, although his majority was small and was only slightly increased when he appealed to the country again in 1966.

In 1970 Conservative Party leader Edward Heath won an unexpected victory over Labor leader Harold Wilson. Beset by labor problems and increased unemployment in 1974, Heath failed to win support for a coalition government and Wilson again won the election. The new Prime Minister named the first minority government since 1929.

Laissez Faire (*lĕ'sā' fâr'*). A phrase used in economics to deprecate any sort of governmental interference in trade, commerce, or manufactures. The expression in full, *Laissez faire, laissez aller*, means that anyone should be allowed to make what he likes and as he likes, without minute government regulations.

Land League. This Irish organization was founded in 1879 by Michael Davitt, a member of

the British Parliament and a bitter opponent of English rule in Ireland. In October of the same year, Parnell was elected its president. The League became a powerful weapon aimed at the rack-renters as the landlords of that period were called. Its main objects were the reduction of the rents of small farmers and tenant-laborers. It was met by truculent and stubborn opposition on the part of the landlords. Agrarian crimes followed, and the league was suppressed in 1881. By the Wyndham act of 1903 most of the claims insisted on by the Land League were granted. See *England, Ireland.*

Last Battle. The battle of Culloden, 1746, between Charles Edward, the Young Pretender, and the duke of Cumberland; so called by reason of its being the last battle fought on British soil.

Latvia. This Baltic province of Russia, inhabited chiefly by Letts, had a period of independence beginning in 1919. It had previously been known as Courland, which from about 1260 to 1560 was part of a federal republic organized by the Knights Templars among the Baltic provinces. For the next 135 years it was a duchy tributary to Poland. Then, in 1795, it was subject to Russia. Its modern period of independence came to an end when, in 1940, Russia occupied it pursuant to a secret agreement with Hitler. The United States refused to recognize the occupation.

Legitimists. The supporters of the claims of the elder branch of the Bourbon dynasty to the throne of France. As partisans of Charles X, king of France (1824–30), and of his family, they were known as Carlists. On the death of the Comte de Chambord, last of the French Bourbons, most of the Legitimists gave their adhesion to the Orleans branch, a few only, who were called *Blancs d'Espagne*, choosing to transfer their allegiance to the Spanish claimants represented by the family of General de Bourbon. See *Spain.*

Letters of Marque. A license or commission granted by a government to a private individual, to fit out an armed vessel for the purpose of cruising at sea as a privateer and capturing the enemy's ships and merchandise. Such acts were formerly not regarded as piracy. Letters of marque were condemned and abolished by the powers that signed the Treaty of Paris in 1856, and they are no longer recognized by civilized powers. See *Declaration of Paris.*

Lettres de Cachet (*lĕt'r' dē kà'shĕ'*). Letters, or warrants, bearing the royal seal. Before the French Revolution, French monarchs often issued such letters, containing arbitrary orders for the imprisonment, without trial, of certain persons who might be regarded as obnoxious to the court. These warrants were used also to protect family honor or to discipline unruly sons like the Comte de Mirabeau.

Liberals, British. With the transformation of English political parties and political institutions that accompanied the important political and industrial reforms of 1832 and the period that followed, the Whigs, the more progressive English party, gradually assumed the name Liberals, and the Tories, the name Conservatives. The Liberals have traditionally been the party of peace, anti-imperialism, free trade, and social reforms. See *Whigs, Conservatives.*

Liberal Unionists. Faction of the Liberal party in England, which, under the leadership of Joseph Chamberlain, refused to support Gladstone's Irish Home Rule bill in 1886 and formed an independent group which finally merged into the Conservative party.

Liberum Veto (*lĭb'ĕ-rŭm vē'tō*). In the ancient diet, or state assembly, of Poland, before any measure of legislation could be passed, complete unanimity among the members was required. Any one member could veto any proposition under discussion and so prevent its passage into law. This extraordinary right was called the *liberum veto.*

Lithuania. This Baltic province of Russia enjoyed a period as an independent republic from 1920 to 1940. In the 11th century, the Lithuanians were tributary to Russia, but under Ringold and his successors, in the 13th century, they became independent. Eventually the Lithuanian power extended southward to the Black Sea. In the 14th century, by a royal marriage, Poland was united with Lithuania. A closer political union was effected in 1569. In the late 18th century, when Poland was partitioned, Lithuania was divided between Russia and Prussia.

Lithuania declared its independence in 1918, and a constitution was adopted in 1920 making it a democratic republic. Pursuant to a secret treaty between Russia and Germany in 1939, Russia occupied Lithuania the following year. This occupation was not recognized by the United States.

Little Entente. A name applied to the series of agreements among Czechoslovakia, Yugoslavia, Rumania, and Poland, which followed the convention signed on August 13, 1920, between the first two of these powers. Edward Benes, foreign minister of Czechoslovakia, was the leading spirit of the Entente. Its purpose was mutual protection and it served powerfully to support the interests of France against those of Germany. It opposed consistently the union of Austria with Germany. Its power was broken when Germany occupied Austria and later Czechoslovakia without France coming to its assistance.

Locarno Treaties. At Locarno, Italy, on October 5, 1925, representatives of Great Britain, France, Italy, Belgium, Germany, Poland, and Czechoslovakia met for the purpose of insuring mutual security from war. As a result, the Rhine Security Pact was agreed to by Germany, Great Britain, France, Italy, and Belgium. It bound the signatories to accept the existing frontiers established by the Versailles treaty and to the demilitarization of the Rhineland, a provision subsequently repudiated by Germany. Germany and France, and Germany and Belgium undertook not to attack each other, but to submit possible disputes to conciliatory bodies.

Lollards. A nickname given to the followers of Wiclif about the year 1381. Calling themselves "poor preachers," they attacked the abuses of the wealthy religious orders and some of the most vital teachings of the Church. In the reign of Henry V, 1414, a plot against the life of the king was traced to some of the Lollards, and as a consequence many of them were hanged or sent to the stake. Those who escaped were forced to live in the larger cities, where they are reputed to have paved the way for the reformed doctrines in the reign of Henry VIII.

Long Parliament. The fifth parliament of Charles I, which assembled Nov. 5, 1640. In 1653, reduced to 60 members, the Rump, it was turned out by Cromwell. It was recalled in December 1659, and dissolved itself March 16, 1660.

Mad Parliament. The Parliament held in 1258 to settle the differences between Henry III and his barons, and so called, in derision, by the adherents of the king. It drew up the Provisions of Oxford, by which an advisory council of fifteen was to meet twelve representatives of the barons thrice a year for consultation. This plan operated until the rising of the barons in 1263, under Simon de Montfort.

Madras (*mà-drăs'*) **Mutiny.** This mutiny, among the officers in the Madras army of the East India Company, arose from the action of the directors, who sought to deprive the officers of certain perquisites which had been looked upon as rights. Sir George Barlow made an appeal to the sepoys, who took the side of the authorities, so that the

officers were forced to submit. Twenty-one of the ringleaders were punished, the rest of the mutineers being allowed to resume their duties.

Maffia (*mäf'fē-ä*). An Italian secret society which attains its ends by assassination and murder. The murder of Notarbartolo, deputy of Palermo, in 1899, forced the Italian government to institute a close investigation, which led to the temporary suppression of the maffia in Italy. Many atrocities in the United States, notably in New Orleans in 1890, have been traced to the activities of this ruthless gang. Its strength is said to have been broken through the conviction, in 1928, of 214 members of the organization in Italy.

Magdeburg, Sack of. The Thirty Years' war (1618–48) began in Germany with the rising of the Protestant nobility against the emperor Matthias, a Catholic. Henceforward, it might be said, religion was made a pretext in Europe for incessant warfare, in which neither side gave quarter to the other. An instance of this ruthless fighting was the sack of Magdeburg in 1629, when nearly the entire population of this Protestant town was put to the sword by the troops under the Austrian general Tilly.

Magna Charta (*măg'nà kär'tà*). The great charter which the English barons forced King John to grant at Runnymede, June 15, 1215. It was an amplification of a previous charter granted by Henry I a century before, and included certain rights and privileges, which in the course of time had come into existence. It was the foundation of the personal liberty of the English people. It limited the feudal obligations of the barons and others toward the crown, restricted the powers of sheriffs and other legal officers, and gave an accused person the right to be tried by his peers.

Mahdi. The last *imam*, or spiritual leader of the faithful, expected by the Mohammedans. This title has been taken by several leaders of Moslem sects, notably by Mohammed Ahmed, who in 1885 captured Khartoum and put to death General Gordon, who was then Egyptian governor of that region.

Majuba Hill. Gladstone, in 1880, had denounced the annexation of the Transvaal by the English government under Disraeli. But, before he could alter the government's policy, the Boers rose in revolt and defeated a detachment of British troops at Majuba hill, Feb. 7, 1881. The name became a battle cry of the English, during the Boer war of 1899–1902.

Mamelukes. A corps of Turko-Egyptian cavalry formed originally from slaves who had been sold by Jenghis Khan to the Egyptian sultan in the 13th century. Becoming powerful, they established their own government by appointing one of their leaders sultan in 1251. This government was overthrown by Selim I of Turkey, who took Cairo, their capital, by storm in 1517. The Mamelukes, however, remained attached to the Egyptian army until 1811. They were defeated by Bonaparte at the battle of the Pyramids in 1798. See *Egypt*.

Manchukuo (*măn'chōō'kō'*). A state erected under Japanese suzerainty in 1932 out of the Chinese territory formerly known as Manchuria. Ex-emperor Hsuantung of China was made regent as Henry Pu-Yi. Ostensibly to protect Japanese investments and rights under various "secret treaties," the Japanese army seized this territory in 1931, the population of which is over 90 per cent Chinese. Active economic development of the country began at once with Japanese capital. After World War II, Russia took control and returned it to China pursuant to a treaty of 1950.

Mandarins. The term is properly applied only to officials called *kwan* by the Chinese. There were nine grades of kwan, and a distinguishing colored button or stone set in the hat was worn by each to denote the particular grade to which the wearer belonged. The word probably comes from the Sanskrit and signifies "a counselor."

Mestizos (*mĕs-tē'zōz*). In Spanish America and in the Philippines, this name is applied to persons of mixed blood; especially the offspring of a European or person of European stock and an East Indian, a Negro, a Malay, or other person of dark non-European stock. Often in the Philippine Islands, the term is applied to those of Chinese and native blood.

Métayage (*mĕ-tā'yâj*). The system of cultivating land for a share of its yield, carried out in France before the days of the Revolution. The tenant was supplied with stock, seed, and implements, receiving in return for his labor one-half of the produce. This system was once common in England, and it is still found in Italy and in certain districts of the United States.

Mississippi Bubble. A speculative scheme projected by John Law in Paris about 1717. Well known in the financial world as an ardent advocate of paper money, Law in 1716 founded the Banque Générale and began to carry out his views regarding this form of currency. So successful was he, at first, that the French government granted him control of the trade with Canada and the Mississippi country. For a while his "system" prospered and large fortunes were made. But the overissue of paper money proved his undoing; this, together with government hostility, brought about the inevitable collapse, which left France on the verge of bankruptcy and thousands of families ruined.

Mogul. The word is the same as *Mongol*. The moguls, or "great moguls," were the descendants and successors of the Mongol conqueror, Timur, or Tamerlane. They ruled India from 1526 to 1765, when their power was subordinated to English authority. See *India*.

Molly Maguires. Members of a secret society in Ireland, formed in 1843 to intimidate law officers and prevent the service of writs. Their name came from an Irish rebel leader in 1641, and from the fact that they wore women's attire as a disguise. A similar Irish association was organized in the coal districts of Pennsylvania against the mine owners in 1854, which, after a series of many crimes, was at length vigorously suppressed in 1877.

Moros (*mō'rōz*). A group of Mohammedan Malays inhabiting the southwestern part of the Philippines, chiefly the Sulu archipelago and the islands of Palawan and Mindanao. Their social and legal customs are interpretations of the *Koran*. Polygamy and slavery were formerly established customs among them, and their piracy was long a source of trouble. After the United States took over the islands, a Moro province was organized, education was introduced, slavery was abolished, and the natives were disarmed.

Mountain (La Montagne). A name given to the extreme revolutionary faction in the National Convention during the French Revolution. It was so called because the Jacobins, with Robespierre and Danton at their head, occupied the upper tiers of seats at the left in the Convention. The "mountain" came to an end soon after the fall of Robespierre in 1794.

Nantes, Edict of. This name designates the law of Henry IV in France which, in 1598, gave a measure of religious freedom to the French Protestants, or Huguenots. They received liberty of conscience, full civil rights, permission to meet for worship in certain places, and provision by the government of 100 places of safety. The privileges enjoyed by the Huguenots under the Edict of Nantes were under constant attack by the Catholic majority. Churches built in places not specified in the Edict were destroyed. At length, in 1685, Louis XIV revoked the law, and all civil rights and religious liberties were withdrawn from the Huguenots. Approximately 400,000 migrated to other countries. French

Protestantism was again accorded tolerance at the time of the Revolution.

Nations, Battle of the. The battle of Leipzig, Oct. 16, 17, 18, 1813. Five nations were represented. The armies of France met the combined forces of Prussia, Russia, Austria, and Sweden. The battle was followed by the retreat of the French, under Napoleon. See *France.*

Naval Limitation. On July 11, 1921, the Congress of the United States, by an amendment to the naval appropriations bill, authorized President Harding to arrange for an international conference upon limitation of armaments. The president, on August 11, 1921, issued formal invitations to Great Britain, France, Italy, Japan, and China; later, to Belgium, the Netherlands, and Portugal. The conference assembled in Washington on November 12, 1921, and terminated its deliberations on February 6, 1922.

Agreement upon any limitation of military armaments proved impossible, and restriction of naval forces was virtually confined to placing limitations upon the building of capital ships. Seven treaties embodied the results of the work of the conference. Of these the most important were:

1. A *Five-Power Naval Treaty*, by which the capital ship strength of the United States and Great Britain was fixed at 525,000 tons each, that of Japan at 315,000 tons, that of France and Italy at 175,000 tons each.

2. A *Nine-Power Treaty*, with reference to Chinese affairs. This treaty was signed by representatives of the United States, Great Britain, Japan, France, Italy, Belgium, the Netherlands, Portugal, and China. It provided essentially for recognition of the territorial integrity of China and for an open-door policy in respect to economic rights and privileges.

The Washington Conference set a precedent in naval limitation by agreement. This precedent was followed in the London naval arms conference of 1930, where the battleship tonnage of the United States and that of Great Britain were further reduced to about 460,000 and Japan's to 290,000. Limitation agreements were extended also to cruisers and other classes of ships.

By 1937, the results of the Washington conference had largely been erased. The territorial integrity of China was ignored in Japanese aggression that resulted, among other gains, in erecting the puppet state of Manchukuo in 1932. The Japanese refused to renew the London agreement on any terms short of naval parity with the United States and Great Britain, and these powers refused to accede to terms demanded. The United States, Great Britain, and France agreed to a conditional limitation of the caliber of guns used on certain types of ships. The essential failure of agreement in any large sense, however, ushered in a period of rearmament that cast its shadow over the entire international horizon.

Nihilists. Members of a great revolutionary party organized in Russia as early as 1818, to whom the term "nihilists" was first applied in 1860 by Turgenev, the Russian novelist. Originating as a protest against serfdom, the movement found a leader and theorist in Mikhail Bakunin (1814–76), who advocated the overthrow of governmental authority so that an uncoerced communism might take its place. It was, in fact, a philosophical anarchism, which was to bear strange fruit in the 20th century.

The Russian government sought to crush the movement with an iron hand, many persons being imprisoned or exiled to Siberia. Reprisals on the part of the nihilists followed, culminating in the assassination of Alexander II in 1881. For many years after this event, nihilists and anarchists conducted their propaganda and operated from abroad, chiefly in France and Switzerland. They made common cause with communist underground leaders, such as Lenin and Trotzky. But when the latter seized the right moment in 1919 to take over the Russian government, it became apparent that abolition of governmental authority was the last thing sought by the new leaders. Nihilists and anarchists were more ruthlessly suppressed in the new Russia than they had been under the czars. See *Bolshevism.*

Nîmes (*nēm*), **Pacification of.** The proclamation of an edict at Nîmes in 1629, confirming the religious freedom of the Huguenots who had been defeated the previous year at the siege of La Rochelle. While it endorsed the Edict of Nantes, it left the Huguenots a powerless and unarmed political party, without rights or privileges as citizens. As a result, the Huguenot League in a short time was disbanded.

"No Bishop, No King." Utterance credited to James I, in criticism of the self-governing organization of the Presbyterian and Independent churches. The phrase involves recognition of the kinship between revolt against the authority of an established head of the church and revolt against the authority of a single monarch in the state. Events proved the truth of James's prophesy. The democratic organization of Presbyterian and Independent churches gave substance and currency to the principle of self-government, which, carried over into the organization of the state, resulted in the English Revolution of 1649, the decapitation of Charles I, and the founding of the English Commonwealth. The later Revolution of 1688 and the American Revolution were likewise, in no inconsiderable degree, the product of the democratic spirit fostered by the self-governing organization of the Independent churches.

Noche Triste (*nō'chā trēs'tā*). The "mournful" or "disastrous night" of June 30, 1520, when the Spanish conquerors of Mexico were well-nigh annihilated. On the death of the friendly disposed chieftain Montezuma, Cortés, fearing violence from the natives, decided to withdraw secretly from Mexico City. His intentions, however, had been anticipated; for he and his troops were met by the natives at the pass of Tlacopan. A terrible slaughter followed, in which the Spaniards lost 450 of their own men together with 4000 Indians who fought with them as allies. Most of the rich plunder they had secured and the costly treasures given them by Montezuma were sunk in the lake and never after recovered. See *Mexico.*

Normandy. The district of northern France, bordering on the English channel, and now included in the departments of Seine-Inférieure, Eure, Orne, Calvados, and Manche. The name Normandy comes from the Normans, or Northmen, who conquered the territory in the 10th century. In 1066 William II, duke of Normandy, became William I of England and united the two realms. The French regained Normandy in 1204 and held it until 1417. Then the English recovered it and maintained their authority until 1450, when Charles VII finally seized it for the French. Small remnants of the old province, the Channel islands, still belong to England. In them much of the old customary law of Normandy is in force, and many of the people continue to speak the old Norman French tongue. See *England, Normans.*

North German Confederation, The. This union of all the German states north of the river Main was formed in 1867, after the close of the Austro-Prussian, or Seven Weeks', war. It was Bismarck's creation. A legislature of two houses, the Bundesrath and the Reichstag, was provided for. The members of the Bundesrath were appointed by the sovereigns of the states, and Prussia had 17 out of the total of 43 votes. The members of the Reichstag were elected by the people. The Confederation gave way, in 1871, to the German Empire. See *Germany.*

Olympiad (*ō-lĭm'pĭ-ăd*). In ancient Greece, the interval of four years between successive celebrations of the Olympic games. Said to have

been used first by the historian Timæus as a unit for computing time. The year 776 B. C., when Corœbus won the foot race, was taken as the first year of the first Olympiad. The use of this system ceased with the abolition of the Olympic games in 394 A. D.

Open-Door Policy. The arrangement with respect to Chinese commerce, supported by general consent rather than by special treaties of the nations, under which all nations should be allowed to trade in China upon equal terms. The policy was opposed to that of special "spheres of influence." The United States made this the cornerstone of its policy toward China early in the 20th century. The policy became meaningless when Japan sought to conquer China in 1937 and remained so after China was taken over by the Communists in 1948.

Opium War. This war (1840–42) between Great Britain and China was precipitated by the attempt of the Chinese government to stop the importation of opium, which was being smuggled into China by British merchants. It ended in the Treaty of Nanking, by which Hongkong was ceded to Great Britain, while Canton, Amoy, Foochow, Nangpo, and Shanghai were opened as treaty ports, thus giving a free hand to the opium merchants for their illegal traffic. See *China.*

Orangemen. A secret politico-religious society founded by Ulster Protestants in 1795 to uphold Protestant ascendancy against Catholic influence in the government of Ireland. Lodges or branches of this society are to be found throughout the British Empire and in many parts of the United States. The name was given them by the Catholics of Ireland on account of the Protestant support of the cause of William III, prince of Orange, in the revolution of 1688.

Ordeal, Trial by. This ancient method of determining the guilt or innocence of a person by putting him to painful or dangerous tests was supposed to be under divine control and intervention. It formed a part of judicial procedure in Europe as late as the 13th century. One of the severest of these tests was that by which the accused person was forced to walk blindfolded over red-hot plowshares. If he escaped injury, he was adjudged innocent. Other kinds of trial by ordeal were those by battle, by water, and by the drawing of lots. Such trials were condemned by the Church in 1215 and were abolished in England in the same year, with the exception of the ordeal by battle.

Orders in Council, 1807. These were specific orders made in Council and promulgated by the British government, as a reply to Napoleon's Berlin Decree, establishing a blockade on the continent. They prohibited any neutral from trading directly with France or with her allies. All goods were to be landed in England for the payment of duty and were then to be re-exported according to English regulations. These orders had an especially serious effect on American commerce, and the irritation they caused was, without doubt, one of the chief causes of the War of 1812. See *Berlin Decree.*

Organizer of Victory. The popular title of Lazare Nicolas Marguerite Carnot, noted French statesman, strategist, and scientist, whose services as war minister (1793–95) were marked with great distinction and success. He became governor of Antwerp in 1814 and was minister of the interior under Napoleon in 1815. He was born at Nolay, Burgundy, France, May 13, 1753, and died at Magdeburg, Prussia, Aug. 2, 1823.

Outlawry. In early days, outlawry was a declaration of hostility by the community against one who defied its constituted authority. The goods of such a person were forfeit, and he was liable to be killed at sight. Later, it became a mere process by which the criminal was brought within the jurisdiction of the courts. After the 13th century the wanton killing of the outlaw was forbidden. Outlawry in this sense is now practically abolished in England and is completely obsolete in the United States. The term is also used to express the process of making a particular act or course of conduct unlawful, either by legislation, by judicial interpretation, or, in the case of nations, by treaty.

Oxford Group. A semi-religious but informal movement founded by Frank N. D. Buchman while an undergraduate at Oxford University in 1921. The name was first applied by the press of South Africa in 1928. The professed purpose of the movement is "to solve personal, national, and international problems by bringing men and women everywhere back to the basic principles of the Christian faith, enhancing all their primary loyalties."

Without organization, membership, subscriptions, or definite creed, the movement rapidly obtained adherents in nearly all countries of the world, particularly among the middle and upper classes, and was accorded recognition by leading figures in many governments. Adopting the slogan of "moral rearmament" in 1938, the leaders of the movement sought by spread of its principles to stem the rising tide of national hostilities. Buchman was born at Pennsburg, Pa., in 1878.

Oxford Movement. This was a movement to counteract the liberalism and rationalism toward which the clergy of the Church of England, at the time, were tending. It originated at Oxford university in 1833 in an endeavor to bring the Anglican Church back to the principles of the early Christianity of the Fathers. Its fundamental principles were laid down in a series of ninety pamphlets known as "Tracts for the Times." These tracts, contributed mainly by Newman, Pusey, Froude, and Isaac Williams, set forth the necessity of a visible church with sacraments and theological dogmas, and they supported the contention that this church is based upon unbroken apostolic succession and includes the Anglican Church. Tract No. 90, written by Newman, declared that the Thirty-nine Articles might be so interpreted as to be consistent with the doctrines of the Council of Trent. It caused a great sensation among the Anglican bishops and was condemned by them in 1841. Newman, with several other leading tractarians, thereupon entered the Church of Rome.

Panama Scandal. The estimate for the building of the Panama canal was given by De Lesseps, the French engineer, as $169,000,000. The French Panama Company was accordingly formed, shares were taken rapidly throughout France and elsewhere, and the work was begun in 1881. In 1889 the company declared itself bankrupt, and an investigation followed. It was found that of the 54 miles only 12 had been finished, and that no less than $260,000,000 had been expended. The directors of the company, including De Lesseps and his son, were tried and found guilty,—some of bribery, others of misuse of the company's funds. This great scandal was called by the Parisians *La Lessive du Panama*—"the Panama dirty linen." In 1904, the United States acquired by purchase the rights of the French company and undertook to build the canal. See *Colombia, Panama Canal.*

Pan-Germanism. A movement in Germany which developed in 1894 into the Pan-German League. The purposes of the league were stated in 1903 as (1) the strengthening of German national self-consciousness, (2) the education of German youth in German ideals, (3) the uniting of all Germans wherever they resided, (4) the furthering of German colonization.

Pan-Slavism. A Russian movement having for its ideal the confederation of all the Slavic nations under the leadership of Russia. The natural conflict of this policy with the designs of Turkey and those of Germany had much to do with precipitating World War I.

Paris Pact. This treaty, known also as the Briand-Kellogg peace treaty, grew out of an original proposal of April 1927 by Aristide Briand, foreign minister of France, that France and the United States should agree mutually to outlaw war as a means of settling their disputes. Secretary of State Frank B. Kellogg proposed that the treaty be multilateral. This proposal was accepted. The pact was signed in Paris on August 27, 1928, by representatives of the following fifteen nations: United States, France, Great Britain, Germany, Italy, Japan, Irish Free State, Canada, Australia, New Zealand, South Africa, India, Belgium, Czechoslovakia, and Poland. All other nations were invited to be adherents.

By this pact, the contracting parties condemn recourse to war for the solution of international controversies and renounce it as an instrument of national policy in their relations with one another. They further agree that the settlement of all disputes arising among them shall never be sought except by pacific means. An important effect of this agreement is to confer on all signatory governments the legal right to express an opinion on any incident which threatens war. The exercise of this right involves consultation. In general, aggressive wars thereafter were carried on without official declaration.

Partition of New World, Papal. Pope Alexander VI, in order to prevent disputes between the Spaniards and the Portuguese in regard to their discoveries in the East Indies and the West Indies, established, in 1493, a line of demarcation which was to serve as a permanent division between the claims of the two rival powers. The pope had already confirmed Portugal in her claims to the islands and countries of Africa which she had discovered. Spain asked for a similar confirmation of her claims in the West. Accordingly, the pope drew upon the map a line from the north to the south pole, at a distance 100 leagues west of the Azores, and decreed that the newly discovered lands west of that line should belong to the Spaniards, and those east of it to the Portuguese. Portugal, however, proved dissatisfied with this arrangement, and, by the Treaty of Tordesillas in 1494, another line 370 leagues west of the Cape Verde islands was substituted. By the new adjustment, Portugal eventually obtained possession of Brazil.

The authority claimed for the partition was a document which later was found to be a forgery but at the time was generally regarded as authentic. This was the so-called Donation of Constantine, purporting to be a grant by the Emperor Constantine (324-337 A. D.) to the Pope of temporal dominion over Rome and the states of the West. The document was proved to have been fabricated in Rome in the 8th century.

Patricians and Plebeians. The two classes of citizens in ancient Rome. The struggles of the plebeians to gain social and political rights mark the early history of the republic. The patricians were the descendants or adopted members of the original ruling *gentes* or "clans." The heads of these clans were called *patres*, or "fathers," hence the word "patricians." The plebeians, from *plebs*, or "multitude," were mostly small landowners of the country near Rome. See *Rome*.

Peace Corps. An agency of the United States government established in 1961 to train and support persons dedicated to improving the lot of underdeveloped peoples throughout the world. Established by President Kennedy March 1, 1961, and made permanent by Congress the following September 21, the corps is authorized to send enlistees abroad only on the invitation of the host nation for specific projects. Enlistees must be at least 18 years of age and serve for two years, including a period of intensive training. They receive a subsistence allowance and $75 a month at the end of their service. Emphasis is on training native personnel to carry on the projects worked on, which cover agriculture, engineering, education, sanitation, community development, and many others.

Peace of Portsmouth. The peace treaty which closed the Russo-Japanese war was signed at Portsmouth, N. H., September 5, 1905. The envoys of Japan and Russia had been brought together through the mediation of President Theodore Roosevelt. The treaty provided for (1) a Japanese guardianship of Korea, (2) evacuation of Manchuria by both powers, (3) transfer of Russian rights at Port Arthur to Japan, (4) division of the Manchurian railway between Japan and Russia.

Peasant War, The Great. The most important of a series of peasant uprisings in the 16th century. This revolt spread, in 1525, from the southern Black Forest through Austria, Alsace, and the lower Rhine. At first, the peasants were under the leadership of Götz von Berlichingen, who finally deserted them. He was succeeded by an Anabaptist fanatic named Münzer, who, with vast numbers of his admirers, played the leading part in this most bloody insurrection. After issuing a manifesto, in which they set forth their demands, they finally proclaimed a community of goods. None of their demands was granted. Münzer was captured at Frankenhausen and was executed. The rebellion, quelled with unheard-of cruelty, left the peasants in a worse condition than they were in before.

Peking, Treaty of. This treaty, signed Oct. 24, 1860, by China, Great Britain, and France, ratified that of Tientsin, made two years previous. It also imposed upon the Chinese the payment of a large indemnity for insults offered to the plenipotentiaries on their way to Peking. Moreover, it stipulated that Christianity was to be tolerated, that the Chinese tariff should be revised, and that, in the future, ambassadors should reside in Peking.

Peninsular War, The. Sometimes called the War of Spanish Independence. A series of campaigns conducted from 1808 to 1814 by the English, Spanish, and Portuguese against the French forces in Spain. The English general, Wellington, had succeeded in driving the French from Spain at the time of Napoleon's abdication, April 6, 1814. See *England, France, Spain*.

Pericles (*pĕr'ĭ-klēz*), **The Age of.** The period in the 5th century B. C. in which Athens reached its highest point of achievement in democratic government, in literature, and in art. The era takes its name from Pericles, who from about 461 to 429 was the most influential leader in Athens. Some historians reckon this entire period as the age of Pericles; others restrict the term to the fifteen years, 445–431, when Pericles was sole ruler of the Athenian democracy. During this latter period Pericles brought about the adornment of Athens with statues and public buildings, including the Parthenon and other structures on the Acropolis, which reflect the greatest glory upon his age. See *Greece*.

Personal Union. Where two countries are united, not organically or politically, but through the person of their common ruler, their relation is a personal union. Such was the union of England and Scotland from 1603 to 1707. Other instances are the following: From 1815 until 1831 the czar of Russia was king of Poland; the king of the Netherlands was also grand duke of Luxembourg (1814–90); the king of Denmark was, for several centuries, duke of Schleswig and Holstein; in 1920, Iceland ceased to be a Danish posession, and had the status of a personal union by electing the king of Denmark as her king until she became a republic in 1944.

Peter's Pence. Voluntary contributions sent from all over the world by members of the Catholic Church, for the use of the pope. It serves not only as maintenance of the papal household, but also for the multitudinous expenses of the Vatican, a great portion of these funds going to the support

of Catholic missions abroad. Peter's pence dates its origin to Offa, king of Mercia, in the 8th century, and had then for its object the establishment and the upkeep of a Saxon college in Rome.

Physiocrat. A follower of the 18th century school of economic thought which maintained that land is the sole source of national prosperity, and that wealth itself consisted of nothing more than raw materials and other products of the soil. The farmer, under the physiocratic doctrine, was the only productive worker in the state; the merchant, capitalist, and town laborer were in large measure looked upon as parasites who added nothing at all to the total production of the state. The founder of this school of thought was a Frenchman, François Quesnay.

A corollary of the central principle of the physiocratic theory was that all revenues required by the state should be derived from a single, direct tax upon the land—that being the only true resource of the nation. Likewise, the *laissez-faire* doctrine was approved, according to which the state should not interfere with the natural economic and social evolution of the community.

Plantagenets (*plăn-tăj'ĕ-nĕts*). The ruling house in England from the accession of Henry II in 1154 to the accession of Henry VII in 1485. Matilda, daughter of Henry I, married Geoffrey, count of Anjou, and Henry II was the child of this marriage. Geoffrey, it is said, usually wore in his cap a sprig of broom, or *plante de genêt*, whence arose the name.

Poland, First Partition of. By a mutual arrangement in 1772, between Catherine of Russia, Maria Theresa of Austria, and Frederick of Prussia, the following division of Poland was made: Russia received the eastern part of Lithuania; Austria, East Galicia and Lodomeria; Prussia, Polish Prussia (except Danzig, Thorn, and Ermeland) and the Netze district.

Poland, Second Partition of. At the close of the Polish civil war in 1793, Russia and Prussia invaded Poland and extorted new cessions. Russia took the remaining part of Lithuania, together with Volhynia and Podolia; Prussia took Danzig, Thorn, and the whole of Great Poland. In addition to this, Russia forced the Poles to a *treaty of union*, by which the former received: (1) free entry for her troops into Poland; (2) the conduct of all future wars; (3) the right of confirming all foreign treaties made by Poland. All this ruthless treatment and appropriation led to the famous revolution in Poland the following year, under the leadership of Kosciusko. See *Lithuania, Poland.*

Poland, Third Partition of. The remaining territories of Poland were divided between Prussia, Austria, and Russia in 1795, after the defeat of Kosciusko. By the three partitions, the following increase of territory had been acquired:

Russia, 181,000 sq. mi., 6,000,000 inhabitants
Austria, 45,000 sq. mi., 3,700,000 inhabitants
Prussia, 57,000 sq. mi., 2,500,000 inhabitants.

Popes. See *Bishops and Popes of Rome.*

Popish Plot. In August 1678, there appeared in England an adventurer of the name of Titus Oates, who sought to make profit out of the prevailing distrust of the English people for Charles II. Oates had adopted various religions and had actually been a Jesuit lay brother in Spain, where he had been expelled by that society for drunkenness and worse. He announced the existence of a great "popish plot," which proved to be a tissue of lies and absurdities. Nevertheless, the populace was more than inclined to believe him. Shortly after his "revelations," Sir Edmund Berry Godfrey, before whom Oates had made his depositions, was murdered. All London became inflamed, and the Catholics were at once accused of the crime. A new test act was hurriedly passed, excluding all Catholics from Parliament, and five Catholic peers were sent to the Tower. Coleman, secretary to the duchess of York, was tried for treason and was executed.

Pragmatic (*prăg-măt'ĭk*) **Sanction.** An edict upon important state business, issued by the head of the state and formerly regarded as an unchangeable part of the fundamental law of a country. The most important of such papers in European history is that published in 1713 by the Holy Roman emperor, Charles VI. Having no son, Charles VI, by this instrument, settled his dominions on his daughter Maria Theresa. He induced most of the European sovereigns to guarantee it; but Charles Albert, elector of Bavaria, the next heir to his dominions, refused. This caused the War of the Austrian Succession after the death of the emperor in 1740. Bavaria finally acknowledged the pragmatic sanction in the Peace of Füssen (1745). See *Austrian Succession, War of; Hungary.*

Prague, Peace of. The name applied to two important treaties. (1) A treaty signed in 1635, to which the various sovereign states of Germany were parties. By it the following provisions were made: The elector of Saxony was to receive Lusatia, and his son August, the archbishopric of Magdeburg for life. The hereditary right of Austria to Bohemia was to be recognized and Pomerania given to the elector of Brandenburg. Certain ecclesiastical estates, confiscated before the Convention of Passau and now at the disposal of the emperor, were to be retained by the present possessor forever. Common cause was to be made in driving out the Swedes from Germany, and religious freedom was to be allowed to Lutherans alone. (2) The treaty between Prussia and Austria, Aug. 23, 1866. It closed the Seven Weeks' war. Austria recognized the dissolution of the German Confederation, the reorganization of Germany to the exclusion of Austria herself, and the annexations contemplated by Prussia. See *Germany.*

Pride's Purge. The name given to the act of Colonel Pride and his troopers, who forcibly ejected from the House of Parliament, in 1648, the Presbyterian majority of the Long Parliament, who favored reconciliation with the king, Charles I. The remaining sixty members, army sympathizers, came to be known as the Rump Parliament. See *Rump Parliament.*

Primogeniture (*prī'mō-jĕn'ĭ-tûr*). The law or custom, still in force in Great Britain, by which all real estate descends to the oldest son. The custom derives historical importance from its effect upon succession to the throne or to titles of nobility.

Quietists. A body or sect of religious mystics, whose system was based on the withdrawal of the mind from all worldly matters and its constant employment in the passive contemplation of God and His attributes. This system was first set forth by Miguel de Molinos, a Spanish priest living in Rome. His views were opposed by the Jesuits, and he was condemned by the inquisition. About 1680 Quietism came into vogue among certain devotees in France, under the guidance of Madame Guyon.

Quisling. Term used in World War II to characterize those who, in the countries conquered by Germany, aided the invaders, and took part in governments formed by them on Nazist principles. It derived from Major Vidkun Quisling, an officer in the Norwegian army, who used his position to aid the invasion, and was placed at the head of a German-controlled government. Quisling was executed after the war as a traitor.

Reconcentrados. The noncombatants of the rural districts of Cuba during the rebellion of 1895–98. General Weyler forced them to leave their homes and concentrated them in camps, where many died as a result of government neglect.

Red River Rebellion. A rising, in 1869, of the half-breed settlers in the valley of the Red River of the North, as a protest against the transfer of this settlement to the new province of Manitoba. The rebels, led by Riel, became a serious menace. Sir Garnet Wolseley was sent against them the following year and succeeded in quelling the insurrection. Riel escaped, but, leading a later rebellion in 1885, he was captured and executed.

Reformation, The. The name applied to the religious movement in the 16th century, to which the Protestant Church traces its origin. As a result of this revolution, several European states renounced their adherence to the Roman Catholic Church and adopted some form of Protestant belief and organization. John Huss of Bohemia and John Wiclif in England, who belong to the 14th century, are regarded as forerunners of the Reformation, but Germany was the scene of the first decisive action. Here the movement began in 1517 with Martin Luther's attack on what he called the sale of indulgences. He was excommunicated and in 1521 placed by the Diet of Worms under imperial ban. Other leaders of the revolt on the continent were Zwingli in Zurich and Calvin in Geneva. In England, the direct separation from the Roman Church was brought about by Henry VIII. In its main phases, the Reformation movement was virtually completed by the end of the 16th century.

Reform Bills, English. The Reform bill of 1832 provided for more equitable representation of boroughs and towns in Parliament and extended the suffrage. Its provisions as to redistribution and the franchise, however, still left the larger share of political power in the hands of the landowning classes. The Reform bill of 1867, introduced by Disraeli, provided further extension of suffrage, so that workingmen in large towns were given the ballot. The third Reform act of 1884 gave suffrage to counties on the terms given to boroughs in 1867, and so divided constituencies that, with few exceptions, but one member of Parliament is now elected by each constituency. See *England.*

Regicides. The name given by the supporters of Charles I to the members of the high court of justice, before whom the king was arraigned on the charge of treason and by whom he was found guilty and was sentenced to death in 1649. See *England.*

Renaissance or **Renascence, The.** The name signifies the period of transition, in western Europe, from the middle ages to modern times. With the meaning "re-birth," it is associated with the brilliancy of Petrarch and that of the classic scholars of the 14th century in Italy, where it led to great advances in expressional painting and sculpture and to a return to classical design and form in architecture. The glorious works of such men as Michelangelo, Brunelleschi, Leonardo da Vinci, Raphael, Correggio, Titian, and others testify to what heights this movement rose toward the end of the 15th and early in the 16th century.

The renewal of relations between Italy and Constantinople, due to the menace of Turkish advance at the close of the 14th century, brought the Byzantine scholars, with the literature of Greece, into Italy, and further stimulated the free spirit of the Renaissance in the culture of art and letters, which spread rapidly throughout the rest of Europe. Such momentous events, too, as the invention of printing, the discovery of America and of the sea route around Africa, added a new impetus to this great revival and conduced to wonderful expansion in every branch of trade, industry, and commerce.

Reptile Fund. A name given in Germany to a Prussian fund, held as indemnity for the deposed king of Hanover, the interest on which fund was payable to the king for the loss of his sovereign rights. A part of this fund, it was said, was diverted by Bismarck to subsidize certain journals in the interest of the government.

Revolution of February 1848. The French Revolution which overthrew the government of Louis Philippe, drove him into exile, and established the Second Republic. Its effects were felt in other countries in Europe; for risings followed quickly in Germany, Italy, Belgium, and elsewhere.

Rhodesia. This former colony of Great Britain in southeastern Africa declared its independence unilaterally in 1965. The declaration was rejected by Great Britain, which imposed economic sanctions.

Rhodesia, previously known as Southern Rhodesia, had been a member of the Federation of Rhodesia and Nyasaland from 1953 until 1963, when the federation foundered on the rocks of racial discrimination and the white settlers' fear of expropriation by the Negro majority. The other members became the independent states of Malawi and Zambia, while Rhodesia reverted to self-governing status under a constitution approved by Britain and the Rhodesian electorate. This constitution pledged enlargement of the political rights of the Africans, who outnumbered the whites by about 28 to 1.

The premier, Ian Smith, in 1965 in effect nullified the constitution by this declaration of independence and aligned his country's policy with that of the contiguous republic of South Africa in providing for white supremacy.

Riel's Rebellion. This was a rising of Indian half-breeds in Saskatchewan, Canada, in 1885. They were led by Louis Riel, who had been at the head of a similar rebellion, which took place in the valley of the Red River of the North in 1869. It was suppressed by the Canadian militia under Middlelow, Riel being captured and executed. See *Red River Rebellion.*

Riff. This mountainous district adjacent to Spanish Morocco in northwestern Africa was the scene of repeated attacks by natives under Raisuli against Spanish outposts prior to 1921. In that and the following year, Abd-el-Krim threatened Spain's hold over the protectorate. In 1925, Abd-el-Krim attacked French Morocco, but after initial successes was driven into the Spanish zone and in 1926 was forced to surrender.

Romanovs (*rō-mä'nŏfs*). The reigning family in Russia from the accession of Michael Feodorovich Romanov, founder of the family, in 1613, to the deposition of Nicholas II in 1917. Through the grandmother of Michael, the family is connected with the line of Rurik, the Scandinavian ruler of Novgorod in the 9th century.

Roundheads. Nickname given to the Anti-Royalist party in England during the period of the Civil War and the Commonwealth, so-called because of their Puritan custom of wearing the hair closely cut, as distinguished from the Cavalier habit of wearing the hair in long flowing locks. The Roundheads were the immediate precursors of the Whigs, as the liberal party in English politics. The term was also sometimes applied to members of the Whig party by their opponents.

Rump Parliament. The name given to the 60 members of the Long Parliament left sitting after "Pride's purge." Having been expelled by Cromwell in 1653, they were recalled to the House in May 1659, their number now reduced to 42, and again turned out in October. Recalled two months later, they were forced by Monk, in the succeeding year to receive the excluded members, and the Rump, as such, came to an end. See *Pride's Purge.*

Rye House Plot. A plot hatched in 1683 by the Whigs to kill Charles II and the duke of York. It owed its name to a farmhouse in Hertfordshire, the supposed meeting place of the conspirators. Lord Russell and Algernon Sidney, said to be the ringleaders, were tried and executed.

Ryswick, Treaty of. A treaty signed at a village of this name near The Hague, Sept. 21, 1697, between France on the one side and England, Holland, and Spain on the other. Its chief provisions were: (1) France acknowledged William III

as king of England and Anne his lawful successor, thus abandoning the cause of James. All conquests in Catalonia were restored to Spain as well as those in the Spanish Netherlands, with the exception of 82 places. (2) The Dutch restored Pondicherry in India to the French, receiving commercial privileges in return. (3) England and France mutually restored conquests in America. The treaty was ratified a month later by the emperor Leopold, when France ceded all the annexed territories except Alsace and restored to the duke of Lorraine most of his dominions. See *England.*

Salic Law. A code of laws relating to crimes, civil injuries, and inheritance of estates among the Salian or Merovingian Franks. It was compiled, probably, toward the end of the 5th century. By the Salic law, "no portion of Salic land shall come to a woman; but the whole inheritance of the land shall come to the male sex." The reason for this exclusion was, it is said, that certain military duties attached to the possession of land at that time. By the arbitrary application of this law to the succession to the crown, women were excluded from the throne of France in the 14th century; and it is in this sense that the term "Salic law" is commonly used. In medieval France great fiefs were held by women, and the "law" would have had no application to the royal domain and the crown, save for intrigues which followed the death of the sons of Philip IV without male issue. The same principle was successfully used by Philip of Valois, who became Philip VI. It was partly involved in his conflict with Edward III of England and in similar conflicts in Spain from 1714 to 1830. See *England, France, Hundred Years' War.*

Sanctions. A term applied to penalties that could be imposed under terms of the League of Nations Covenant against a nation officially declared an aggressor. They could be economic, involving partial or complete trade boycotts, or military, involving armed force. Economic sanctions were applied ineffectively against Italy in 1935-36 as penalty for an aggressive war against Ethiopia.

Sanctuary. The protection afforded to criminals, debtors, and others, from the ordinary operation of the law, by reason of the sacred character of the place to which they fled, such as a church or abbey. From the days of Constantine, in many Catholic countries, certain churches were set aside and privileged as asylums for those escaping from the hands of justice. In England down to the Reformation, any person who sought refuge in such a place was immune from the law—except in the case of sacrilege or treason—if, within forty days, he showed signs of repentance and expressed his willingness to go into exile. Sanctuary for crime was abolished by James I; but sanctuaries for debtors continued to exist in and around London till 1697, the most noted of these being that of Whitefriars, near the Temple, which claimed this privilege to a much later date. The Abbey of Holyrood in Scotland still retains the right of giving sanctuary; but, since the abolition of imprisonment for debt, the need for seeking it no longer exists.

San Salvador. A little island of the Bahama group, West Indies, known also as Watling's island. This probably is the island upon which Columbus made his first landing in the New World, October 12, 1492, and to which he gave the name of San Salvador.

Sans-Culottes (*sănz'kû-lŏts'*). Literally, "without breeches." An opprobrious name given by the aristocrats during the French Revolution to the advanced republicans and to the Paris mob in general, who stormed the Bastille. It appears to have been a name willingly assumed, as many of the revolutionaries had, in contempt, discarded the knee breeches affected by the royalists and now wore trousers as a mark of differentiation.

Saragossa (*să'rà-gŏs'à*). A city of northeastern Spain, situated on the Ebro river. It rises picturesquely on a fertile plain, a cluster of castles and palaces. Saragossa was one of the first Spanish cities to adopt Christianity. In 1808-09 the French besieged the city, which resolutely resisted, the siege costing 60,000 lives. The citadel was formerly the palace of the kings of Aragon and the headquarters of the Inquisition.

Sardinia, Kingdom of. An old-time dynasty, restored in 1720, when Austria ceded Sardinia to the duchy of Savoy. It comprised principally Savoy, Piedmont, and the island of Sardinia, and became the nucleus of the present kingdom of Italy. King Charles Albert, being defeated in a war with Austria in 1848-49, abdicated in favor of Victor Emmanuel. Cavour was then appointed premier. He sought for and achieved the unification of Italy. Emilia, Tuscany, the papal states, and Naples were, in turn, annexed in 1860, and in the following year Victor Emmanuel assumed the title of king of Italy. See *Italy.*

Sassanidæ (*să-săn'ĭ-dē*) or **Sassanids** (*săs'à-nĭdz*). A strong Persian dynasty named from Sassan, the grandfather of Ardeshir, or Artaxerxes, the founder of the dynasty. In 226 Ardeshir overthrew the Parthian rule. He revived the Zoroastrian religion, and began the extension and strengthening of his realm which was continued by his successors. The last of the line, Isdegerd III, was defeated by the caliph Omar in 641 at the battle of Nehavend, and in 651 was murdered. The caliphs thereafter ruled Persia. See *Parthia, Iran.*

Scapa Flow. An enclosed water area in the Orkneys, off the north coast of Scotland, between the islands of Mainland and Hoy. Scapa Flow became of note during the World War of 1914–18 as the base of the British fleet. In 1919, it was the scene of the scuttling of the German fleet, which lay anchored there after its surrender to the Allies.

Schism (*sĭz'm*) **of the East, The Great.** Called also the Eastern Schism. The severance of the Greek from the Roman Church in the 9th century. It began by a dispute over what is known as the *Filioque* clause, inserted in the Nicene Creed in 589, affirming that the Holy Ghost proceeds from the Father *and the Son.* The Greek theologians raised doctrinal difficulties on this point and denied such procession of the Holy Ghost. In this way a bitter and endless controversy arose between the two great churches. To this dispute was added the high-handed action of the emperor Michael III in 857, who intruded Photius into the see of Constantinople in place of Ignatius, the rightful patriarch, thereby overriding the papal jurisdiction. Still further differences arising between Pope Leo IX and Patriarch Michael Cerularius in 1054, the Greeks were at length cut off from communion with the Church of Rome.

Schism of the West, The Great. After the return of the papal court from Avignon to Rome and the death of Gregory XI (1378), an Italian was elected his successor as Urban VI. The French cardinals refused to acknowledge him and named Clement VII as their choice. This scandal of two rival popes lasted nearly forty years. It was finally quelled in 1417 by the deposition of no less than three phantom popes and the election of Martin V. It is known as the Great Schism of the West.

Schleswig-Holstein Question. From 1386, when the two duchies, Schleswig and Holstein, came under one government, to 1850, their political relations formed a vexed question. Schleswig was mostly Danish in population; Holstein, mostly German. Holstein was a member of the German Confederation, Schleswig was not. The Germans in Schleswig sought to induce the Danes to enter the

Confederation; but the latter resented such attempts and in 1863 declared Schleswig incorporated in Denmark. In the quarrel that ensued, Bismarck saw the means of possible aggrandizement for Prussia and for later differences with Austria. He invited Austria to co-operate with him in settling the Schleswig-Holstein entanglement. War was declared by the two powers against Denmark, which, being defeated, was forced to cede the two duchies to her joint conquerors. These, in turn, now disputed as to the disposition of their spoils. This was the opportunity for which Bismarck had planned. Accordingly, in 1866, he forced Austria into war. It took but seven weeks for Prussia to overthrow her unyielding rival; as a result the duchies of Schleswig and Holstein were annexed and incorporated in the Prussian kingdom. After World War I, a plebiscite provided for by the peace treaty gave North Schleswig to Denmark, South Schleswig and Holstein to Germany. See *Denmark, Plebiscite, World War I.*

Scutage, "Shield Money." This was a tax first levied by Henry II in 1159. The owner of every knight's fee or shield (*scutum*) was obliged to pay a sum of money known as scutage, or escuage, in lieu of personal service. The feudal vassals were bound to but forty days' foreign service, whereas Henry needed a standing army in Europe to defend his continental possessions against the king of France. By this levy, he was enabled to hire mercenaries abroad, and the vassals were saved from taking part in quarrels in which they took no interest.

Seleucidæ (*sê-lū'sĭ-dē*). The dynasty of kings descended from Seleucus who, after the death of Alexander, came into possession of the satrapy of Babylon in 323 B. C. He assumed the kingship of territory reaching from the Euphrates to the Indus and later conquered Syria and Asia Minor. The later kings of the dynasty gradually lost power and territory until the last, Asiaticus, was conquered by Pompey in 64 B. C.

Sepoy Mutiny, The. A mutiny among the native soldiers of India against their British officers in 1857. India was governed at the time by the British East India Company. The mutiny was suppressed, but it resulted in the transfer of the administration of India to the British Crown. This bloody conflict was popularly believed to have been caused by the refusal of sepoys, or native soldiers, to use cartridges that were greased with pork or beef fat, the muzzle-loading rifles requiring the soldier to bite off the end of the cartridge. But this was only incidental. There was evidently a carefully laid plot, with powerful influence behind it. The revolt spread through the greater part of India, the principal leader being Nana Sahib, rajah of Bithoor. His grievance was that the East India Company, which virtually ruled India, had stopped the pension that was granted to his family and had refused to let him, an adopted son, inherit lands. Among the other leaders was the ranee, or princess, of Jhansi, who appeared in the field at the head of two mutinous regiments. She fought ferociously and was killed at Gwalior in the last great battle. There were sieges at Lucknow, Bithoor, Cawnpore, Gwalior, Delhi, and at other towns; and there were fearful massacres by the natives, with terrible vengeance by the British. Two generals, Lawrence and Havelock, died in the war. Sir Colin Campbell, general in chief, defeated Nana Sahib at Cawnpore and then, with increased forces, conquered the other bands of mutineers, destroyed many forts, and disarmed the people. More than 1,300,000 arms were surrendered. See *East India Company, British; India.*

Serfs, Russian. Formerly, nine-tenths of the agricultural land of Russia was owned by the imperial family and by the Russian nobility. It was tilled by the millions of people known as serfs, whose condition was little better than that of slaves. They were attached to the soil by what was known as seignioral prescriptive right, that is to say, they were bound to cultivate the land for the owner, from the fact that they were born or lived on the estate.

Alexander II began in 1859 to free the crown serfs. In 1861 he issued an edict of emancipation which abolished serfdom throughout the empire and won for him the title of "Czar Liberator." But it brought neither peace nor prosperity. The peasants found that they were worse off than in pre-emancipation days and were paying the landlords, through the state, more than the land given them was worth. The following fifty years saw the steady growth of unrest and dissatisfaction, ending in the most appalling tragedies that modern times have ever witnessed. See *Russia.*

Sevastopol (*sê-vàs'tô-pôl*). A seaport in southern Russia, on the Black Sea. The town submitted to a memorable siege in the Crimean war of 1854-55, being beleaguered by the British, French, and Turks for eleven months, the Russians finally yielding. Sevastopol was virtually created anew after the ruin wrought by the conflict. In World War I it was a Russian naval base, and its occupation by the Bolsheviki marked the end of the Czarist resistance. In World War II it was taken by the Germans, after a long and heroic defense, in July 1942; and retaken by the Russians in May 1944.

Seven Years' War. One of the most important wars, in its far-reaching effects, of the 18th century. It was waged (1756–63) between Frederick the Great of Prussia and the allied forces of Austria, France, Russia, Saxony, and Sweden. Frederick received naval and financial aid from England and had the support of Hanoverian troops. In 1762 Peter III of Russia made alliance with Frederick and supported him until the end of the struggle. The war was waged, not only in Europe, but also in India and America, where it was known as the French and Indian war. It was concluded by the Peace of Paris, which left the British triumphant in America and in India and raised Prussia to the rank of a first-class power.

Shantung (*shän'tŏŏng'*). This historic province of China embraces an area of about 56,000 square miles in the peninsula lying between the Gulf of Chihli and the Yellow Sea. Here live approximately 26 million people in one of the most densely populated districts of the world. Shantung is famous as the birthplace of the Chinese sages, Mencius and Confucius. The loftiest mountain in the province, Tai-shan, near the western boundary, has for centuries been a sacred place of pilgrimage.

The Boxer rebellion centered in Shantung. In 1897-98, Germany secured a lease of the port of Kiaochow, with some inland territory and valuable mining concessions in this province, as indemnity for the killing of German missionaries. Early in World War I, Japan seized Kiaochow, and by the Treaty of Versailles she was confirmed in the possession of all rights and concessions which Germany had held. To this arrangement China refused to subscribe, and, by a treaty negotiated at Washington in 1922, Japan agreed to surrender these privileges to China. Japanese forces were withdrawn from Shantung in December 1922. See *China, World War I.*

Shimonoseki (*shē'mô-nō-sâ'kē*), **Treaty of.** The Chinese, defeated by Japan in the Chinese-Japanese war and alarmed for the safety of Peking, agreed to make peace and signed the Treaty of Shimonoseki, April 17, 1895. By the terms of this treaty, China ceded Port Arthur, the Liaotung peninsula, the island of Formosa, and the Pescadores islands to Japan, agreeing to pay also an indemnity of about $300,000,000. Moreover, China recognized the independence of Korea. But Japan was, in the end, deprived of the most coveted fruits of her victory. She was forced, by Russia, France, and

Germany, to surrender the Liaotung peninsula on the ground that Japanese possession of Port Arthur would be a menace to the peace of the Far East. See *China, Japan, Russia.*

Siberia. This region, occupying most of Asiatic Russia and covering an area of nearly 4,000,000 square miles, was inhabited by Tatars and Turks before its partial colonization and conquest by Russia in the 17th century. The Russians agreed in 1689 by the Treaty of Nerchinsk with China, not to occupy territory beyond the Amur River, that is, in the present Manchuria. In 1710, Peter the Great began the practice of exiling political offenders to Siberia, and the country became notorious for its prison camps both under the monarchy and later under Communist rule.

About the middle of the 19th century, the eastward movement of Russian power was resumed. The Amur River was established as the boundary with China in 1847. In 1860, Vladivostok on the Sea of Japan was founded. The Trans-Siberian railway was begun in 1891 to link this port with European Russia. Penetration into Manchuria was checked by the Russo-Japanese War in 1905.

Under the Soviet Russian government, Siberia was divided into a number of separate political units. The government began intensive development, founding new cities, and developing new industries. By 1960, the population of the region was over 24,000,000, about three times that of 40 years earlier. Siberia contains 90 per cent of Russia's coal resources, 80 per cent of its water power, 65 per cent of its iron ore, and 50 per cent of its known oil and gas reserves.

The intensive development of Siberia before World War II had, as one objective, the strengthening of Russian defense against Germany. This purpose was fulfilled in that the German conquest of the greater part of European Russia in 1941 and 1942 did not paralyze Russia's war production. The arrival of military reserve forces from Siberia is believed to have saved Moscow from capture, and production from east of the Ural Mountains contributed heavily to the western advance of its armies in 1943 to 1945.

Sicilian Vespers. A massacre of French people in Palermo, Sicily, which began at the hour of Vespers on Easter Tuesday 1282 as a popular uprising against the Norman French ruler of Sicily, Charles I. The latter had imposed heavy taxes in preparation for war against the East Roman Empire. Peter III of Aragon, in Spain, took advantage of the rising which had driven Charles I from Sicily and established Spanish rule in the island.

Sikhs (*sēks*). A religious sect constituting the greater part of the population of the Punjab in India. The sect, founded about 1500 by Nanak Shah, professes belief in the unity of the Godhead and in human brotherhood. The name *sikhs* means "disciples." They were organized into a military force by Guru Govind in the latter part of the 17th century, for defense against the Mohammedans and various other religious groups. This force was called the *khalsa*, and every member received the title of *singh*, meaning "lion," hence "noble." Overcome by the Mohammedans after the death of Guru Govind (1708), the sikhs lived in separate communities until they were united under Ranjit Singh in 1792. As a military organization they were crushed by the British in 1849, but they later proved a valuable asset to the British army.

Silesia. A region in central Europe, now lying partly in Poland and partly in Czechoslovakia, which played a prominent role for over 800 years in the political and military struggles of Europe. Occupied by Slavic tribes before 1000 A.D., it was incorporated for a time in the kingdom of Poland and, about 1150, was divided into two semi-independent dukedoms of Upper Silesia and Lower Silesia. The rulers invited German settlers, who introduced weaving industries and developed Silesia's rich mineral resources of coal, iron, and lead. In 1241, Henry II, Duke of Lower Silesia, turned back a Mongol invasion at the battle of Liegnitz.

Central political power was weakened by the practice of dividing feudal estates among the heirs, and protection was sought from Bohemia against Teutonic military orders and other assailants. Silesia was in the orbit of the Habsburg monarchs before the Thirty Years' War (1618–48) and suffered devastation in this struggle. Maria Theresa, ruler of Austria, lost Lower Silesia and most of Upper Silesia to Prussia in 1748. What remained went to Czechoslovakia after World War I, while the German portion, after a plebiscite in 1920, was divided between Germany and Poland. Poland got all the German share after World War II.

Slavery. The system of holding certain persons as the property of other persons to whose will they are wholly bound. Slavery was practiced among all ancient peoples, and in Christian Europe the slave trade did not begin to decline until the 13th century. In the 16th, 17th, and 18th centuries, both Christians and Mohammedans engaged in the African negro slave trade. The Portuguese landed the first shipment of negro slaves to the New World in Santo Domingo in 1503. The first shipload of slaves brought into the British American colonies arrived at Jamestown in 1619.

Great Britain abolished slavery in her colonies in 1833, Sweden took similar action in 1846, France in 1848, Holland in 1859, the United States in 1863, Brazil in 1871, Puerto Rico in 1873, and Cuba in 1880.

Solon, Laws of. In 594 and 593 B. C. Solon, already famous as poet, philosopher, and general, was made archon of the city of Athens, with power to make new laws and to remodel the government. In the first year of his archonship, Solon made several changes in the laws relating to property: (1) Tenants were given full ownership of land which they had tilled for nobles; (2) All debts were canceled; (3) Athenians enslaved in Attica were freed; (4) Enslavement of Athenians was made illegal; (5) The amount of land to be owned by any one person was limited. In his second year Solon created a senate, enlarged the assembly, introduced coinage, required each father to teach his son a trade, and restricted the public appearance of women. See *Greece.*

South Sea Bubble. A financial scheme which was launched in 1711 and which collapsed in 1720. The national debt of England had been causing anxiety to politicians. Accordingly, a bill was passed, enabling those to whom the nation owed money to take shares in the South Sea Company, in place of their claims upon the nation. All classes were under the delusion that the wealth of Spanish America, with which the company proposed to trade, was so enormous that they would be enriched beyond expectation. The madness of speculation spread like an epidemic. Landlords, clergymen, and widows hastened to invest their savings in the South Sea Company. But Spain's refusal to enter into commercial relations with England had rendered the privileges of the company worthless. The result was disaster, which brought appalling distress to thousands of impoverished families in England. See *England.*

Spanish Succession, War of the. A war (1702–14) arising out of disputes regarding succession to the Spanish crown. Charles II of Spain, dying childless, left by will the whole of his dominions to Philip of Anjou, the grandson of Louis XIV of France. Louis, setting aside the Treaty of Partition, which he had made with William III, chose to follow out the will and proceeded to support the claims of his grandson. The Grand Alliance of England, Holland, and the Holy Roman Empire was thereupon formed to oppose his designs. A series of bloody campaigns ensued, lasting nearly ten years. Marlborough fought in Flanders, while Archduke Charles overran Spain. The war came to an end

with the Treaty of Rastatt and Baden in 1714, by which Philip was recognized as king of Spain, under the title of Philip V.

Sphere of Influence. A somewhat elastic term indicating rights claimed by a foreign state over a region with which it has economic or cultural ties. The relationship is not official like a protectorate but is chiefly a matter of custom or implied agreement.

Star Chamber, Court of. So called from decorations on the ceiling of an apartment in the royal palace of Westminster in England. It is first mentioned in 1398 as an established institution. Judicial functions were performed there by the king's councilors in cases not within the jurisdiction of other courts or if the power of the parties was sufficient to overawe jurors in other courts. There were no jurors in the Star Chamber and hearings were open. Cases were often tried there by the desire of the parties but normally the king determined which cases should be heard. The death penalty was never inflicted. In the period of the Civil War against Charles I, this court naturally was used to punish the king's enemies. In 1641, it was abolished by the Long Parliament under Cromwell. The hostility of the Parliamentary party to the court succeeded in attaching to it an odium in later ages which it never had earlier.

States-General (France). The name given to the legislative assembly in France, before the Revolution, consisting of the nobles, clergy, and commons. It is said to have been first summoned in 1302 by Philip the Fair. Sessions were rare, and none were summoned between 1614 and 1789.

Sublime Porte. The name adopted by Western nations to designate the Turkish government at Constantinople. In allusion to the ancient Eastern custom of administering justice at a gate of a city or of a palace, the Ottoman rulers referred to their court as "the lofty gate." The equivalent Turkish phrase was translated into French, the language of diplomacy, and hence into English as Sublime Porte.

Submarine Warfare. The indiscriminate and inhumane use of the submarine, or U-boat, as an instrument of warfare by Germany was a main cause of America's entering World War I. The German navy under von Tirpitz began, January 31, 1915, to destroy without warning British merchant and cargo ships. This policy was followed by the war zone decree of February 4, 1915, and reached its full development on May 7, 1915, when the passenger vessel *Lusitania* was sunk with a loss of 114 American lives. Owing to the protests of the United States, Germany later made some pretense of curbing the activities of the U-boats, but on February 1, 1917, began sinking all ships found within the waters around the Allied countries.

In World War II, the scope of submarine warfare was greatly expanded. Larger submarines with much greater cruising ranges were built. Germany relied heavily on this arm for victory after the United States entered the war, and in 1942 it was estimated that over 7,000,000 tons of Allied shipping was lost through the U-boats.

In the following year, however, the submarine menace to the Allies was practically eliminated by a combination of moves, including provision of "air umbrellas" over convoys, improved methods of detection, and use of special types of boats to track down submarines and destroy them by depth bombs.

In 1954 the launching of the world's first atomic-powered submarine, the U.S. *Nautilus*, marked the beginning of a new era in submarine development. From January 1955 to February 1957, the *Nautilus* completed 60,120 nautical miles at sea without refueling, of which 34,500 miles was submerged travel. It would take three million gallons of oil to equal the *Nautilus*' charge of U-235 weighing only a few pounds. In "Operation Magellan," 1960, the U.S. Navy's largest nuclear submarine, the *Triton*, circumnavigated the globe in 84 days, remaining submerged the entire time.

Suttee (*sŭ-tē'*). A Hindu woman who cremates herself on the funeral pile of her husband; also the act of cremation itself. This dread custom is now practically obsolete in India, having been made illegal by the British government in 1829, under Lord William Bentinck.

Taiping (*tī'pĭng'*) **Rebellion.** A rebellion instigated in southern China, in 1850, by Hung-siu-tsuen, who pretended he was divinely inspired to overthrow the Manchu dynasty and to set up in its place the *Taiping Chao*, or "Great-Peace" dynasty. He promulgated a vague form of Christianity, in which God was called the "Heavenly Father," and Christ, the "Heavenly Elder Brother." Discarding the queue, the insurrectionists went with unshaven heads and flowing locks and were known as the "long-haired rebels." They made many daring attacks on different cities, but were at length overcome in 1864 by forces under the command of Charles George Gordon, known afterwards as Chinese Gordon. See *China*.

Tatar or **Tartar Invasion.** Russia, located on the borders of Asia, fell an easy prey to the Tatars, or Mongols, of the East. In 1237 the successors of Jenghis Khan swept resistlessly over the Russian lands. In a short time the greater part of the country was in their hands, and, after subjugating the people, they obliged them to pay tribute and to furnish soldiers for the Tatar armies. For 250 years the Tatars ruled Russia and to some extent "orientalized" it; but they did not interfere with the religion, laws, and customs of her people. Toward the end of this period, in 1462, Russia under Ivan the Great found herself strong enough to throw off the Mongol yoke. See *Mongols, Russia*.

Terror, Reign of. That period of the French Revolution, between September 1793 and July 1794, when fear was an instrument of government. France was then battling a coalition of all Europe and was at the same time torn by bitter civil strife. The dominant party, of which Robespierre was the best-known member, believed itself justified in obtaining unity of action by literally destroying the opposition. The revolutionary tribunal and the guillotine were the instruments. The government was, however, not responsible for all the atrocities which characterized the time. The deeds of a Carrier at Nantes or of a Fouché at Lyons shocked even Robespierre himself. In Paris about 3000 persons were executed, and no fewer than 15,000 perished in other parts of France. See *France*.

Terrorists. The extreme revolutionary mob of Paris in 1848. Imbued with advanced socialistic ideas, they sought to end their real and imaginary wrongs by the spoliation of the rich. They refused to work and proceeded to set up a revolutionary government at the Hôtel de Ville, but they were overpowered by the garde mobile.

Teutonic Knights. A military and religious order, similar to that of the Templars, established at Acre in 1190 as a brotherhood of German crusaders. It became a political rival of the Knights Templars and Hospitalers, excelling them in lands and riches and winning great prestige in its conquest of the heathen Prussians. The order was dissolved by Napoleon in 1809, but up to a recent period a branch of it existed in Austria, as a semireligious knighthood, devoted especially to ambulance service. See *Germany*.

Thirty Years' War. A war which began in 1618 in which Protestant nobles sought to replace a Catholic Holy Roman emperor, Ferdinand, with a Calvinist, Frederick. For the next 30 years, central Europe was devastated by rival armies living by indiscriminate plunder. The leading generals on the Catholic side were Tilly and Wollenstein, while Gustavus Adolphus of Sweden for the Protestants

revealed military genius of a high order. France, Spain, and England engaged also in the struggle, in which motives of national advantage vied with religious partisanship. The war was brought to a close by the Peace of Westphalia in 1648. Germany is said to have lost one-third of its entire population from the sword, fire, and starvation.

Thugs. A fraternity of religious fanatics in India who worshiped the goddess Kali, to whom it had long been the custom to make bloody sacrifices. From plunder of the property of their victims, murdered by strangling, the thugs derived their support. They were suppressed by the British government in 1830–40.

Tiers Etat (*tyâr' zā'tà'*). In France, the "third estate," or that portion of the nation which was not included in the nobility nor in the clergy. It included the landholding peasantry. In the last States-General (1789) they struggled fiercely for power equal to that of the two privileged classes of nobles and clergy. The "third estate" succeeded at length in reorganizing all the deputies of the three orders as a single National Assembly. They had 600 deputies, equal to the number for the other two orders together, so that with the aid of the minor clergy and the liberal nobles they now took the lead. See *France.*

Tilsit, Treaty of. A treaty between France on the one side and Russia and Prussia on the other. Napoleon and Alexander met on a raft on the river Memel, June 25, 1807. Napoleon dictated the terms, according to which (1) the grand duchy of Warsaw was created out of parts of Prussia; (2) a part of Prussia was ceded to Russia; (3) Danzig was made free; (4) the region on the left bank of the Elbe was ceded to Napoleon; (5) the Confederation of the Rhine was recognized, and Joseph, Louis, and Jerome Bonaparte were acknowledged as kings of Naples, Holland, and Westphalia respectively; (6) Prussian harbors were closed to the British, the Prussian army was reduced to 42,000 and Prussia was to pay large indemnities and be reduced to a second-rate power. See *France, Russia.*

Toleration Act. An act passed in 1689, during the reign of William and Mary, by which Protestant dissenters from the Church of England were given the legal right to worship publicly in their own chapels. They were, however, bound to take the oaths of supremacy and allegiance and to repudiate the doctrine of transubstantiation. See *England.*

Tories, British. After the English revolution of 1688-89, two distinct parties with opposite political views came into existence—the Whigs and the Tories. The Whigs stood for the supremacy of Parliament as against the authority of the king, and for a more liberal, more democratic view of social, economic, and public questions. The Tories, on the other hand, stood for the continuance of the broad royal powers of the Stuart monarchs. When, after a long period of Whig supremacy, George III placed Lord North in power in 1770, the Tory principle of the supremacy of the king in the choice of ministers was put into effect. The period from 1783 to 1794 saw the Tories in power, led by Pitt, and opposed to the landholding group of Whigs. From 1794 until 1830, the Tories and the great Whig landowners were generally united in opposition to popular reform. In 1830, the name Conservative was suggested as a substitute for Tory and was generally used after 1832.

Torres Vedras (*tōr'rĕsh vā'drăsh*), **Lines of.** The fortifications which extended from near the old town of Torres Vedras to the banks of the Tagus. The Anglo-Portuguese armies under Wellington defended these lines against the French led by Masséna, during the winter of 1810-11, and checked their advance toward Lisbon. The longest of the three lines of defense, protecting 500 square miles of territory, measured 29 miles.

Treaties. Treaties are formal written agreements between independent states, with reference to political, commercial, or territorial relations, or other matters of common concern. The constitution and laws of each state determine what authorities shall negotiate treaties. The following are the most important treaties recorded in medieval and modern times. See *Treaties of United States.*

843 Treaty of Verdun. Between Lothair, Louis, and Charles the Bald. It divided Charlemagne's empire among these three grandsons of Charlemagne. To Louis was given the land east of the Rhine; to Charles, the country west of the Rhone and the Meuse; to Lothair, the strip between, including most of Italy.

911 (?) Treaty of St. Clair-sur-Epte. Between Rollo the Northman and Charles the Simple of France. The Northmen were granted a permanent possession of territory along the Seine, later known as Normandy, and feudal sovereignty over Brittany.

1122 Concordat of Worms. Between the emperor (Henry V) and the pope (Calixtus II). It settled by compromise the dispute over investitures.

1183 Peace of Constance. Between Frederick Barbarossa and the Lombard cities. The emperor renounced all royal privileges and rights in the cities, and acknowledged their right to raise armies and to manage their own local affairs. The cities recognized the overlordship of the emperor by an annual money payment.

1360 Brétigny. Between England and France. Closed first period of Hundred Years' war. Edward III renounced claim to French crown, and received sovereignty over Aquitaine, Ponthieu, Guisnes, and Calais.

1397 Union of Calmar. Between Denmark, Sweden, and Norway. United the three kingdoms under Queen Margaret of Denmark.

1420 Peace of Troyes. Between England, France, and Burgundy. Henry V of England married Katherine, daughter of Charles VI of France, and became regent and heir to the French throne.

1466 Second Peace of Thorn. Between Poland and Teutonic Knights. West Prussia and Ermeland were ceded to Poland. The Knights retained East Prussia as a Polish fief.

1508 League of Cambrai. Between Pope Julius II, Emperor Maximilian, Louis XII of France, and Ferdinand of Spain, against Venice.

1529 Peace of Cambrai. Between Francis I and Charles V. Called *Paix des Dames* because negotiated by Margaret of Austria and Louise of Savoy. Francis paid two million crowns and gave up claim to Italy, Artois, and Flanders. Charles temporarily gave up claim to Burgundy and released the French princes, held as hostages since 1526 (Peace of Madrid).

1552 Convention of Passau. Provided for free exercise of religion by adherents of the Confession of Augsburg until the next diet.

1555 Peace of Augsburg. Granted to the territorial princes and the free cities, adhering to Augsburg Confession, freedom of worship and right to introduce the Reformation in their territories.

1576 Pacification of Ghent. Treaty between the provinces of the Netherlands, whereby they united to drive the Spaniards from the country.

1579 Union of Utrecht. The seven northern Netherlands provinces united and declared their independence of Spain.

1632 Treaty of St. Germain. Between France and England. Canada, Acadia, and New France were ceded to France.

1648 Peace of Westphalia. Between France, Sweden, and the Estates of the Empire. Closed the Thirty Years' war.

1659 Peace of the Pyrenees. Between France and Spain. France received some territory. Louis XIV married Maria Theresa, eldest daughter of Philip IV of Spain. She renounced all claim upon her Spanish inheritance, in consideration of a dowry of 500,000 crowns to be paid by Spain. England received the town of Dunkirk by this peace.

1660 Peace of Copenhagen. Between Denmark and Sweden. Denmark surrendered the southern part of the Scandinavian peninsula.

1667 Treaties of Breda. Between England, Holland, France, and Denmark. France was given Acadia; England received Antigua, Montserrat, and English St. Christopher's; Holland retained Surinam; England, New Amsterdam. The treaty provided that goods brought down the Rhine could be shipped to England in Dutch vessels.

1668 Peace of Aix-la-Chapelle. The formation of the Triple Alliance forced Louis XIV to sign this peace, thereby ending his war with Spain. Burgundy was restored to Spain by Louis in return for 12 fortified frontier towns.

1678-79 Peace of Nimwegen. A series of treaties: between Holland and France; Spain and France; the emperor (Holy Roman Empire), France, and Sweden; Holland and Sweden; France and Denmark; Denmark and Sweden. Holland received its entire territory back on condition of neutrality. Spain and France exchanged large cessions of territory.

1679 Peace of Saint-Germain-en-Laye. Between Louis XIV and the elector of Brandenburg. The elector surrendered his Pomeranian conquests to Sweden.

1686 League of Augsburg. Signed by the emperor, the kings of Spain and Sweden, the electors of Bavaria, Saxony, and the Palatinate. Directed against Louis XIV of France.

1697 Peace of Ryswick. Between France and the allied powers,—England, Spain, Holland, and the Holy Roman Empire. Two treaties, providing, among other things, for general restoration of conquests, recognition of William III as king of England and of Anne as his successor. France was given permanent possession of Alsace.

1699 Peace of Karlowitz. Between Turkey and the allies,—Austria, Poland, and Venice. Turkey and Austria divided the territory of Hungary and Transylvania. Venice received Morea (the Peloponnesus).

1713 Peace of Utrecht. Between France and the allies,—England, Holland, Savoy, Prussia, and Portugal. Ended the War of the Spanish Succession. The separate treaties recognized the Protestant succession in England and provided for separation of the crowns of France and Spain. England received Gibraltar, and Sicily was given to Savoy.

1714 Peace of Rastatt and Baden. Between France and the emperor and the Holy Roman Empire. A separate peace by which Austria received the Spanish Netherlands.

1718-19 Quadruple Alliance. Between Great Britain, France, the emperor, and Holland. Designed to maintain the Peace of Utrecht. Spain was forced out of Sicily and Sardinia; Savoy exchanged Sicily for Sardinia.

1721 Peace of Nystad. Between Sweden and Russia. Cession of some territory on the part of Sweden. Russia restored Finland and paid indemnity.

1738 Peace of Vienna. Between France and Austria. Ended the War of the Polish Succession. Provided for French possession of Lorraine; for cession of Naples and Sicily from Austria to Spain; for French guarantee of the Pragmatic Sanction.

1742 Peace of Breslau. Between Maria Theresa of Austria and Frederick II of Prussia. Closed First Silesian war. Frederick withdrew from alliance against Maria Theresa; he received Upper and Lower Silesia from Austria.

1748 Peace of Aix-la-Chapelle. Between Austria supported by Holland and England, and Prussia, associated with France and Spain. Silesia was confirmed to Prussia; the Pragmatic Sanction was sustained in Austria.

1763 Peace of Paris. Between Great Britain, France, Spain, and Portugal. Canada was ceded to Great Britain by France; Florida to England by Spain; Louisiana to Spain by France (treaty of 1762). This peace, with the Treaty of Hubertusburg, closed Seven Years' war.

1763 Treaty of Hubertusburg. Between Austria and Prussia. Ratified Treaty of Breslau.

1774 Treaty of Kutchuk-Kainardji. Between Turkey and Russia. Brought Tatars under Russian influence; gave Russia a powerful position on the Black Sea.

1783 Treaty of Versailles. Between Great Britain, France, and Spain. Great Britain ceded Tobago to France and Florida to Spain.

1795 Peace of Basel. Between France and Prussia and between France and Spain. France was given temporary possession of the left bank of the Rhine, which Prussia, in secret treaty, agreed should be permanent.

1797 Treaty of Tolentino. Between the pope and the French Republic. The pope ceded the Romagna, Bologna, and Ferrara.

1797 Treaty of Campoformio. Between France and Austria. Provided for convening of Congress of Rastatt. Gave France the Austrian Belgian provinces and most of the left bank of the Rhine. Austria received Venice and other territory.

1797-99 Congress of Rastatt. Between France and the Holy Roman Empire. Fruitless negotiations.

1801 Concordat. Between Napoleon I and Pius VII. Provided that French bishops and archbishops should be appointed and supported by the government and confirmed by the pope.

1801 Peace of Lunéville. Between France, Austria, Spain, and the Holy Roman Empire. The Empire virtually abolished. Treaty of Campoformio confirmed. Left bank of Rhine given to France. Louisiana ceded to France by Spain.

1802 Treaty of Amiens. Between Great Britain, Holland (the Batavian Republic), France, and Spain. England surrendered all conquests to France; Spain ceded Trinidad to England; Holland ceded Ceylon to England.

1805 Treaty of Pressburg. Between France and Austria. Austria made large cessions to France and to the kingdom of Italy, recognizing Napoleon as king of Italy. Bavaria and Württemberg recognized as kingdoms.

1805 Treaty of Schönbrunn. Between Napoleon and Prussia. Prussia ceded Cleves, Ansbach, and Neuchâtel to France, on the promise of receiving Hanover in exchange.

1807 Peace of Tilsit. Treaties between France and Russia, and between France and Prussia. Provided large cessions of territory and payment of indemnities by Prussia, and for alliance between France and Russia.

1809 Peace of Vienna. Between Napoleon and Francis I of Austria. Signed at Schönbrunn. Austria ceded 32,000 square miles of territory.

1814 Peace of Kiel. Between Denmark, Sweden, and England. Denmark surrendered Norway. Sweden ceded western Pomerania and Rügen to Denmark. England retained Helgoland.

1814-15 Peace of Paris. Between France and the Coalition. By the treaty of 1814 France retained her general boundaries of 1792, paid no indemnities, and retained captured art treasures. By the treaty of 1815, she was reduced to her boundaries of 1790, an indemnity of 700 million francs was exacted, and art treasures were reclaimed. Louis XVIII made king.

1829 Peace of Adrianople. Between Russia and Turkey. Russian conquests in Turkey surrendered. Recognition by Turkey of the independence of Greece.

1839 Treaty of London. Between Great Britain, Austria, France, Prussia, Russia, and the Netherlands. Regulated position of Belgium (neutralized) in international law.

1842 Treaty of Nanking. Between Great Britain and China. Closed the Opium war. Hongkong ceded to England. Several treaty ports opened.

1856 Treaty of Paris. Between Russia, Turkey, England, France, Sardinia, Austria, and Prussia. Ended the Crimean war. Declaration signed with respect to privateering, blockades, and contraband.

1859 Treaty of Zürich. Between Austria and France and Sardinia. Sardinia received the greater part of Lombardy. Italy was to be a confederation under the honorary presidency of the pope. Treaty provisions soon overridden.

1860 Peace of Peking. Between China and the Western Powers. Ratified the Treaty of Tientsin (1858) and imposed indemnity on China.

1865 Convention of Gastein. Between Prussia and Austria. Provided for control of the duchies of Schleswig and Holstein.

1866 Peace of Prague. Between Prussia and Austria. Closed the Austro-Prussian (Seven Weeks') war. Austria separated from reorganized Germany. Prussian territory largely increased. Venice ceded to Italy.

1871 Convention and Preliminary Treaty of Versailles. Between France and Germany. Provided for cession of Alsace and German Lorraine to Germany and for payment of large indemnity by France.

1871 Peace of Frankfort-on-Main. Final settlement which ended the Franco-Prussian war.

1878 Treaty of San Stefano. Between Russia and Turkey. Closed Russo-Turkish war. Provided for large cessions of Turkish territory to Montenegro, Serbia, Rumania, Bulgaria, and Russia.

1878 Treaty of Berlin. Between Great Britain, Germany, France, Austria, Russia, Turkey. Called to consider Eastern Question. Declared inoperative most of the terms of San Stefano.

1882 Triple Alliance. Between Austria, Germany, and Italy.

1891 Dual Alliance. Between Russia and France. Served to counterbalance the Triple Alliance, formed by Germany, Austria, and Italy.

1895 Treaty of Shimonoseki. Between Japan and China. China acknowledged independence of Korea and ceded Formosa, the Pescadores, and Liaotung peninsula to Japan, besides paying a large indemnity. Cession of Liaotung later exchanged for larger indemnity.

1902 Anglo-Japanese Treaty. A defensive alliance between Japan and Great Britain. Provided mutual aid in case of attack by more than one outside power.

1905 Treaty of Portsmouth. Between Japan and Russia. Russia acknowledged Japan's paramount interest in Korea; transferred lease of Port Arthur to Japan. Both powers were to evacuate Manchuria and restore it to China.

1907 Triple Entente. Treaty between England and France in 1904; between England and Russia in 1907. A diplomatic understanding which developed into the alliance of 1914.

1912 Treaty of Lausanne. Between Italy and Turkey. Closed Turco-Italian war. Tripoli was ceded to Italy.

1913 Treaty of London. Between Balkan states and Turkey. Provided for restriction of Turkey to Constantinople and small adjoining territory. Redistributed conquered Balkan territory.

1913 Treaty of Bucharest. Between Balkan states. Ended second Balkan war. Serbia, Greece, Rumania, and Turkey enlarged at expense of Bulgaria.

1918 Treaty of Brest-Litovsk. Between Germany and Russia. Ended hostilities between the two countries.

1919 Paris-Versailles Treaty. Between the Entente Allies and Germany. Marked the close of World War I. Provided for cession of Alsace and Lorraine to France. Indemnity imposed on Germany.

1919 Treaty of St. Germain. Between Entente Allies and Austria. Provided for reduced Austrian boundaries.

1921 Four-Power Pacific Treaty. Between the United States, Japan, Great Britain, and France.

1922 Five-Power Treaties. Between the United States, Great Britain, France, Japan, and Italy, providing for the limitation of naval armaments. See *Washington Conference.*

1922 Nine-Power Treaties. Between the United States, Great Britain, France, Japan, Italy, Holland, Belgium, China, and Portugal, providing for adjustment of Chinese tariffs and for the open-door policy in China. See *Washington Conference.*

1923 Treaty of Lausanne. Between Turkey and Greece, Great Britain, France, Italy, and Rumania, defining limits of Turkish territory.

1925 Locarno Treaties. Between France, Germany, Great Britain, Belgium, and Italy, demilitarizing the Rhineland and providing for peaceful settlement of disputes; between Germany, Czechoslovakia, and Poland.

1928 Pact of Paris. Between 15 leading nations as original signatories, most other nations later adhering. Renounced war as an instrument of national policy in dealing with parties to the treaty.

1945 United Nations Treaty. The United States and fifty other nations accepted the charter of the U. N.

1949 North Atlantic Treaty. Anti-Communist pact signed by Belgium, Britain, Canada, Denmark, France, Holland, Iceland, Italy, Luxembourg, Norway, Portugal, and the United States. Greece and Turkey became members in 1951 and West Germany in 1955.

1954 Western European Union. Fifteen nations sign accords in Paris, including Britain and the U. S., providing for restoration of German sovereignty, limited rearmament, and its admission to NATO; also autonomy for Saar and stronger supreme command.

1957 European Economic Community. Signed at Rome, agreement created "common market" for members setting schedule for customs union and envisaging monetary, economic, transport, and eventual political union. Original members: France, Italy, West Germany, Belgium, Holland, Luxembourg.

Triple Alliance. In 1879 Germany and Austria formed an alliance by which they bound themselves "to lend each other reciprocal aid with their whole military force and to conclude no peace, except conjointly and in agreement." It was aimed particularly against Russia and, in a lesser degree, against France. In 1882 Italy became a party to this alliance, which then became known as the Triple Alliance. In 1915 Italy declared the alliance dissolved, holding Germany and Austria to be aggressors in the hostilities of 1914.

Trojan War. A conflict between the ancient Greeks and the people of the city-state of Troy, on the coast of Asia Minor. Concerning this war, only the vague traditions and hero tales found in the Homeric poems have survived. Modern excavations on the site have disclosed a ruined city of the 12th century B. C., which is generally presumed to be the city to which Homer's *Iliad* refers.

The city is said to have been captured by the stratagem of the "Trojan horse." This was a huge wooden horse in which a company of Greeks belonging to the besieging army was concealed. The main Greek army pretended to withdraw. The Trojans took the horse inside the city walls. The troops concealed in the horse, emerging at night, opened the gates to the Greek army and the city was sacked.

Tyrol or **Tirol** (*tĭr'ŏl*). An Alpine district which was formerly a crownland of Austria. By the peace treaty of 1919 the northern part of the district was included in Austria as North Tyrol, while the southern part was given to Italy.

Ukase (*ū-kās'*). In Russia, under the monarchy, the public proclamation, or edict, of the czar, bearing the imperial seal and having the force of law. The whole system of Russian government was based on such absolutism.

Ulster Massacre. Repressive measures against the Catholics and the influx of fresh colonists from England, to oust the Irish more completely from the land, led to this fateful massacre in 1641. The Irish, impatient of promised amelioration, attempted to seize Dublin. This plot being frustrated, they turned savagely on the English and Scottish colony in Ulster and put to death, indiscriminately, many thousands of the inhabitants. See *Ireland.*

Ultramontanes. Formerly this term applied to the members of a schismatic body, for instance, those of the Gallican Church who were opposed to papal supremacy. It is now used to designate any party that upholds the papal claim to temporal power, such as the Catholic party in Germany under Doctor Windthorst during the Kulturkampf. See *Kulturkampf.*

Union Jack. The national ensign of Great Britain and Northern Ireland. It is composed of the red cross of St. George on a white field (England), the white X-shaped cross of St. Andrew on a blue field (Scotland), and the red X-shaped cross of St. Patrick on a white field (Ireland). The application of the term "Union Jack" to the national ensign, or Union flag, is an extension of its use by sailors to signify a small flag of like design used as a signal flag, and also flown at the bowsprits of men-of-war and from the mainmast by an admiral of the fleet. Usage, however, seems to have sanctioned the misnomer.

Utrecht, Treaty of. A treaty signed in 1713 between Louis XIV and the allies, England and Holland, at the close of the War of the Spanish Succession. By its terms, Spain and the Indies were to remain under Philip V, who renounced all claim to the throne of France. Sicily was to go to the duke of Savoy, who was to be known as king of Sicily; Naples, Milan, and the Netherlands were to be given to Charles VI; the Dutch were allowed to garrison the southern frontier of the late Spanish Netherlands; France recognized Anne and the Protestant succession in England. The greatest beneficiary of the treaty was England. She retained Gibraltar. Minorca, and in America acquired Hudson Bay territory, Nova Scotia, Newfoundland, and the French part of St. Christopher in the West Indies. Spain also granted her the right of importing slaves into the Spanish colonies and of sending goods to Panama for the Spanish colonists. See *England.*

Vassalage. In the middle ages, the tie between the tenant and the lord from whom he held his land or estate was known as vassalage. Every holder of land was the vassal of some lord. The vassal owed to his lord civil and sometimes military services, also payments of money. In return for such services the lord was bound to protect the life and property of his vassals—in those days no trivial undertaking. All below the king, down to the lesser knights, were regarded as vassals and owed fealty to their immediate superiors.

Vendée, Wars of the. At the period of the French Revolution, the western district of France called La Vendée, with neighboring territories, was inhabited chiefly by a peasant population, among whom the ideas of the Revolution found little acceptance. When, in 1793, a conscription was decreed throughout France, the Vendéan peasants, fond of their old institutions, rose in revolt. Some of the émigrés took advantage of the ensuing conflict to land in France. By the end of the year 1793, however, the republican armies had suppressed the revolt. A policy of conciliation was then followed until the last remnants of the uprising were quelled in 1796. See *Emigrés, France.*

Vikings. Scandinavian sea warriors, sometimes called Norsemen, who harried the coasts of northern and western Europe and the British isles from the 8th to the 10th century and in some places made permanent settlements. Their first recorded expedition was on the coast of Dorsetshire, England, in 789. Their usual method was to make sudden raids on a coast in the summer. After a few seasons, they prepared for a more permanent conquest by "wintering" in the district. By 842 half of Ireland had submitted to the Vikings. Danish Vikings came close to conquering all of England but were defeated by King Alfred. After 897, they settled down and were eventually assimilated in the English population. In France, Vikings besieged Paris for a year (885). In 911, the French king, Charles III, ceded to their chieftain Rollo a region thereafter known as Normandy, where they were quickly assimilated into the French culture.

In this same period, Swedish buccaneers made their way south as far as Constantinople and established rule over market towns on the way. They were known by the conquered Slavs as Rus, which is the origin of the name Russia.

The Viking raids, together with the Moslem conquests to the south of Europe, were the principal factor in converting the continent to an agricultural society insulated for generations from the rest of the world. See *Normans.*

Villafranca, Armistice of. After the defeat of Austria by Piedmont and France at Solferino and Magenta, Napoleon III, without consulting his ally, concluded a truce with Austria. By the terms it was agreed: that Lombardy should be ceded to Piedmont; that Austria was to retain Venetia; that the Italian states were to form a federation; and that the rulers of Tuscany and Modena were to be returned to their duchies. The disloyalty of Napoleon toward his ally, as it appeared in this action, caused the indignant resignation of Cavour. The terms of the armistice were never enforced. Nor indeed were the people of Italy prepared to observe them, as they were determined that nothing should prevent them from reaching their goal, which was the unification of Italy. See *Italy.*

Waldenses. The followers of Peter Waldo, who was a Lyons merchant about 1160. Though they did not seek to set up a new religion, they objected to certain doctrines of the Church, such as the Mass and the praying to saints. They advocated the charity and the poverty of the Apostles and held that the Bible was the only guide to the religious life. They spread from France through many countries in Europe, but exerted no great influence as reformers. They survived much persecution and are still to be found as a Protestant sect in Italy and in other parts of Europe.

Wergild (*wûr'gĭld'*). Among the Anglo-Saxons and other Teutonic races, the money compensation that had to be paid by a murderer to the relatives of his victim in order to avoid a blood feud, or vendetta. Acceptance of the wergild was at first optional, then it became compulsory. Later, it could not be demanded, nor the feud waged, the slayer being left to public justice.

Westminster Confession. The confession of faith framed by Presbyterian and Calvinistic divines at the Westminster Assembly, whose sessions lasted from 1643 to 1649. The confession was mainly an exposition of the Calvinistic doctrine.

Westphalia, Treaty of. This treaty, signed in 1648 by France, Sweden, and Germany, put an end to the Thirty Years' war. It provided that each reigning prince should be free to choose Catholicism, Lutheranism, or Calvinism as the religion of his subjects. In Germany, Protestantism was recognized as the state religion, but provision was made for equal representation of Catholicism in the German diet. The independence of Holland and Switzerland was acknowledged; France acquired Alsace; Sweden secured Bremen, North Pomerania, and Stettin. This treaty virtually ended the period of religious wars in Europe.

Whigs, English. One of the two great English parties from the English Revolution of 1688 until about 1835, when the name Liberals gradually replaced the name Whigs. The Whigs were the anti-Court, anti-Clerical party as distinguished from the Tories who tended to support the old privileges of the king and clergy. From 1714 to 1761, the Whigs were continuously in power, and it was during this period that the cabinet system of England developed into its present form. The Whigs displaced the Tories in 1830 and carried through the reform measures of that period. See *Tories.*

Witenagemot (*wĭt'ĕ-nà-gĕ-mōt'*). In Anglo-Saxon times, the king sought the advice and consent of a body of thegns, nobles, bishops, and abbots, which was known as the *Witenagemot,* or "Assembly of Wise Men." This assembly served as a court of appeal, and, within certain limitations, it could elect or depose a monarch. After the Norman Conquest it still continued to meet under the name of the Great Council, and in the reign of Henry III became transformed into a national parliament representing the people.

Worms, Diet of. An assembly held at the city of Worms in 1521, before which Luther was summoned to answer the accusation of heresy made against him. He refused to retract any of his writings or teachings and was ordered to return to Wittenberg to await the imperial edict. The elector of Saxony, who feared for Luther the fate of Huss, had him conducted in secret to the castle of Wartburg, where he spent a year in translating the New Testament. He then returned to Wittenberg, where he died 24 years later.

Young Italy. A society of enthusiastic Italian republicans led by Giuseppe Mazzini. Formed in 1831, the organization reached the climax of its activity in the unsuccessful invasion of Savoy, under Mazzini, in 1834. This society served, not only to inspire Italian patriotism, but also to arouse the youth of other European nations to progressive political ideals.

Zollverein (*tsôl'fĕr-īn'*). A union of German states for the purpose of establishing and maintaining uniform rates of duty on imports from foreign countries and of free trade among themselves. It was inaugurated under the auspices of Prussia in 1834. The growth and success of this economic system contributed much to the political unification of Germany.

In the preceding pages, the stories of the rise and progress of he states and nations of the world are recounted at some length. Moreover, many special topics, including notable movements, parties, periods, and events of international importance, are treated succinctly in the Dictionary of World History. To complete this plan, and still further to unify the treatment of the subject, the entire course of world history is graphically presented in the following comparative summary of outstanding facts in the story of mankind. The chronological outline histories of the nations are arranged in parallel columns in order to facilitate the attainment of *comparative view* that is so important in the study of history.

Progress in civilization and in political and social development has not been uniform among the nations. In a comparative chart, the occasional long blank spaces in a column, parallel with other quite crowded columns, are instructive. They frequently mark the shallows and the backwaters in the stream of history, telling a story of the persistence of primitive culture, of political stagnation, or of subordination to foreign invaders.

Besides being a convenient source of information, this chart furnishes a study plan for fixing in the memory *related* events and dates, thus supplementing the preceding historical narratives. In this connection, two features especially distinguish this plan: (1) The entries in the column of Arts of Civilization summarize, in its varied phases, the advance of human culture; (2) the distinctive character of modern history since 1815 finds emphasis in the column of International Affairs.

A similar chart, covering the history of the United States and the other American nations, will be found at the close of the section devoted to American history.

Prehistoric Man in Europe

About 50,000 years ago Early Stone Age	Beginning of 3d warm period. Climate grows warm.	Men are hunters. They know the use of fire.	First stone tools. Use of the first hatchet. Flint chipped by pounding.
Middle Stone Age	Beginning of 4th glacial period. Climate grows cold. Reindeer are plentiful.	Men are still hunters. They begin to live in caves. Clothing of skin sewed with bone needles. Cave walls decorated with drawings. Dead buried under family hearth.	Flint tools sharpened by pressing along edge with hard bone. Ivory tools. Weapons of bone, wood, and flint. Bone whistles.
Late Stone Age About 10,000 B. C. Period Begins	Beginning of 4th warm period (which includes present time).	Men hunt; women learn to plant seed and to harvest. Wooden dwellings along streams. Pile dwellings in Swiss lakes. Agriculture leads to permanent settlements. Towns. Primitive commerce. Wars among communities. Rise of nomad tribes, herdsmen, in country east of the Danube.	Polished flint and stone tools. Tools ground on whetstones. Earliest use of the plow. Pottery made.
Period closes about 3000 B. C.	Metals (copper) discovered, probably in peninsula of Sinai, as early as 4000 B. C.; introduced in southeastern Europe about 3000 B. C.; in Britain about 2000 B. C. Bronze age begins.		

From Earliest Records to the Eighth Century B. C.

Describe the social changes that took place in Germany after 1871 566
Discuss the expansion and fall of Germany under Hitler. 567

GREECE, IRELAND, ITALY

Point out the most important contributions that Greek states made to civilization . . . 569
Describe the conquest of Greece by the Hellenes. Name the four historic groups of this people 569
What caused early Greek colonization? . . . 569
Compare the Spartan with the Athenian government 571
Who was the pioneer of Greek philosophy? . . 571
Explain the occasion of the Persian wars. For what exploits are the following places famous: Marathon? Thermopylæ? Salamis? Platæa? 571
Describe the Confederacy of Delos. For what is the Periclean age famous? 571
Tell the story of the downfall of Athens, 431-405 B. C. 571–572
When did Greece become independent of Turkey? What part did Greece take in the Balkan wars? in the World wars? . . . 572–573
Under what names was Ireland known to early classic writers? 575
State the effects of the Danish invasions . . . 575
Describe the effects of the policy of William of Orange in Ireland 576
In what year were the British and Irish parliaments united? Who led the movement for emancipation of Catholics? 576
Describe the Sinn Fein organization. Outline the story of the conflict in Ireland, 1915–18. 576
Who established the Ostrogothic kingdom in Italy? By whom were the Goths driven out of Italy? 577
Describe the character of the Italian city-states. Name the greatest of them 577
Characterize the Sicilian expedition led by Garibaldi. When did Rome become the capital of Italy? 578
What part did Italy play in World War II? . 578

JAPAN, ROME, RUSSIA

Upon what model was the government of Japan organized, about 604? Who established a feudal government, or shogunate? . 578
State the occasion and the results of Commodore Perry's expedition to Japan 579
Summarize Japan's part in World War II . . 579
Name the three most important peoples of Italy at the beginning of recorded history. Who were the Latin people? 587
Describe the conditions which gave rise to the founding of the city of Rome 587
With what rival state did Rome wage wars in the 3d and 2d centuries B. C.? Name three noted commanders in these conflicts 588
Outline the reorganization of government undertaken by Diocletian. State two memorable acts of Constantine. 591
Describe the conditions that led up to the great Gothic invasion of Greece and Italy . 591
How did the Tatar conquest affect Russia? . 592
For what share in Russian history are the following notable: Ivan the Great? Ivan the Terrible? Michael Romanov? 592
Outline the achievements of Peter the Great and Catherine II 592
Who was the moving spirit behind the "five-year plan" inaugurated in Russia in 1928? 593
What part did Russia take in World War II? 593

SPAIN, TURKEY, YUGOSLAVIA

Discuss the Carthaginian occupation of Spain. Describe the condition of Spain under Roman rule. Recount the most important features of the reign of Ferdinand and Isabella . . . 595
Who first proclaimed the Spanish republic? . 596
Discuss the Civil War and Franco's dictatorship 596
Outline the steps by which the Ottoman Turks became the first military power in Europe . 597
What defeat broke the sea power of the Turks? 597
Summarize the career of the Turkish Nationalist movement. Who led this movement? . . . 598
When and from what territories was Yugoslavia constituted? 599

WORLD WAR I

What were the causes, immediate and more remote, of World War I? 611
Compare the strength of the combatants at the opening of the war 612
In what respects was the battle of the Marne among the decisive battles of the world? . . 612
How did von Hindenburg become a national hero? 613
How was poison gas introduced? how did airplanes develop? 615
State the result of the battle of Jutland . 615–616
What was the effect on the war of the Russian Revolution? 618
When and where was the armistice with Germany signed? 620
Summarize the provisions of the treaty signed June 28, 1919 by the Allies and Germany. 620–621
State several governmental and territorial changes in Europe, resulting from the war. 621–622

WORLD WAR II

Compare the two World Wars as to extent, weapons, and method 624
What part was played by communism? . . . 624
What was the Munich Pact? 625
Why did Great Britain and France declare war? 626
Describe the siege of Britain 629
Trace the course of the Russian war in 1941–42 630–631
Trace the course of the war in the Pacific and the Far East 631–632
Trace the movements of the Allied armies in the West from Normandy to the Rhine . . 635
What caused the surrender of Japan? 638

DICTIONARY OF WORLD HISTORY

Tell the story of the *Armada* 642
Recount the circumstances that occasioned the destruction of the Bastille 643
Name the so-called decisive battles fought since the year 1800. 644
What were the chief uses to which the catacombs of Rome were put? 648
Tell the story of the Children's Crusade. . . . 648
What is the "domesday book"? 651
Who were the Guelphs and the Ghibellines? . 653
When was the English Habeas Corpus act passed? State the meaning of the act . . 654
Who were the Lollards? Account for the name Long Parliament; for Mad Parliament . . 657
Describe trial by ordeal 660
Explain the so-called "papal partition of the world." 661
When was the Peace Corps founded? What was its purpose? 661
Explain the historical application of the term Renaissance 663
For what events in the Crimean war and the World Wars is Sevastopol famous? 665
Recount briefly the history of the so-called South Sea Bubble 666
What was the "Trojan Horse?" 670

BIBLIOGRAPHY

While not forming in any sense an exhaustive list of history readings, this bibliography represents a selected library of authoritative and readable works upon the histories of important nations and geographical regions, and upon world history in its different periods. For perspective on the entire field of human history, the reader is referred to Arnold J. Toynbee's *A Study of History* (available in abridged form) and to *The Outline of History* by H. G. Wells. Books which furnish background for an understanding of history may be found under fiction, biography, geography and other classifications.

ANCIENT HISTORY

Bibby, Geoffrey—Four Thousand Years Ago. *Knopf '61*
Bourne, Frank C.—A History of the Romans. *Heath* '66
Breasted, J. H.—History of Egypt . . . *Scribner*

Picture Guide: The World Trade Center in New York City—The United Nations Building—Views of Historic Washington, D.C.

Historic Washington Buildings—Right, Monument to George Washington, First President of the United States. The 555-foot obelisk rises near the Potomac River, between the Capitol and Lincoln Memorial. Designed by Robert Mills in 1836, the monument was begun in 1848. Completed in 1884, it was dedicated in 1885. Above, the Jefferson Memorial to the third U.S. President. It was completed in 1941 and dedicated in 1943 on the 200th anniversary of Thomas Jefferson's birth. It was designed by John Russell Pope in the classical style Jefferson admired. (*Photographs courtesy U.S. Department of the Interior*)

The White House—Official residence of the President of the United States. The presidential mansion was designed by the Irish-American architect James Hoban. The cornerstone was laid in 1792 and the building was completed in 1800. British troops set fire to the structure in 1814, destroying the interior; Hoban supervised the reconstruction, which was completed in 1817. White paint had been used to cover the blackened exterior in 1817, and from that time the building was known as the White House—the name was made official in 1902. The view above is of the north portico, which forms the main entrance. (*Courtesy of the White House*)

Government

INTRODUCTORY

It may be useful to distinguish between the art of politics and the science of politics. The art, ideally, is the practice of government so that it accords with justice, so that the dignity and the effectiveness of institutions are maintained and good and able men are kept in control of public affairs. The science of politics analyzes and elaborates the theory of the state and examines the various types of public administration, past, present, and proposed. The two things flow into each other. The fields of "morals and legislation" tend to become closely united. It has been a common conception, from the time of Hobbes to the present day, that the state creates morals or standards of conduct; that what the state decides and commends is ethically right. But there is a different view; namely, that there is a Moral Order higher than any human laws, higher than the state itself, by which all acts of authority are to be judged. This, in the final analysis, was the ethical issue in World War I and subsequent wars.

Need for Government. There is a widespread disposition, by no means of recent origin, to question the usefulness of the state. To the anarchist, laws are a stumbling block and a stone of offense, and, to radical reformers generally, governments are institutions for the exploitation of the many by the few. But a scientific canvass of society in its various stages, from savagery to civilization, reveals the certain fact that, however much governments have been and still are associated with acts of oppression, there is no escape from human ills in anarchy. Mankind, without a common authority, is predatory. Society released, as occasionally happens, from the respect and dread of government, promptly exhibits the most violent and terrible tendencies. Imperfect as governments are, discriminating in their bestowal of advantages as they too frequently are, nevertheless they are the safeguard and security for the advantages of life. The sentimental philosophers of the 18th century imagined a natural state enjoyed by savage peoples, in which the blessings of simplicity and freedom were attained. Modern study of primitive society reveals no such happy "state of nature," but everywhere a cramped and cruel savage existence in which life is never free from danger and the human mind seldom released from terror.

History of Political Philosophy. The science or philosophy of politics is one of the richest fields of human inquiry. It possesses a great and classical literature. Its scope and its form of reasoning were first clearly developed by the Greek philosopher, Aristotle, whose *Politics* lies at the base of subsequent discussion. Aristotle's studies were limited to the Greek "city-state," which, to his mind, represented the highest attainment of human freedom and law. His method was concrete and inductive. He collected hundreds of city-state constitutions, compared their provisions, and deduced general principles. The state, to Aristotle, was not a Utopia such as that imagined by Plato, but it was an actual institution realized in hundreds of examples throughout the Ægean and Mediterranean seas. No writer has stated better, or in fewer words, the purpose of civilized society. "The state," says Aristotle, "comes into existence, that man may live. It continues, that man may live well." "Good life," in all its rich and noble expressions, is the aim and object of the state.

Centuries after Aristotle, another political philosopher, the Italian statesman Machiavelli, examined the city-states of his own day, with results that offer startling contrasts. Machiavelli's political studies are embraced in two works. The first, called *The Prince*, is a discussion of the sinister principles whereby the Italian despot of that day maintained himself in power. The other, *The Discourses*, which is a far nobler and more suggestive work, examines the principles whereby a republic may endure.

A century later comes the period where national governments rise above feudal conditions. The king attains an absolute power and destroys the independence of the nobles. This monarchical movement met with opposition. In England it was overthrown by revolution. Out of the struggles of the period came several notable works, the most influential one being *The Leviathan*, by Thomas Hobbes, who attempted to justify monarchical absolutism by the theory of a "social contract" between subjects and kings.

Later, in the 18th century, John Locke, in his two treatises on civil government, turns the doctrine of the social contract against the monarchists, laying the basis for the "right of revolution" in the abusive exercise of a power which monarchs have contracted to use with justice and discretion. "Men are," said Locke, "by nature all free, equal, and independent." Only by free consent does man enter into the obligations of society, resigning his natural rights to a public authority in return for benefits which, if not satisfactorily conferred, he is at liberty to end. Misrule by a monarch, in Locke's view, not only justifies rebellion but makes it inevitable. Locke powerfully affected the minds of the English colonists in America, and some of his actual language appears in the Declaration of Independence. The revolutionary ideas of Locke were put into a winged form by Rousseau, whose *Social Contract* contributed incalculably to the French Revolution and has remained to the present day an inspiration to political revolt.

Latin America. Particularly in the countries of South and Central America,the example of the American revolution against Great Britain exerted a powerful influence. Country after country threw off the Spanish yoke and adopted a republican form of government modeled after that of the United States and incorporating such ideas as bicameral legislatures, the legal separation of powers between legislative, executive, and judicial departments, commitment of executive office to a president popularly elected for a fixed term, and the constitutional guarantees of civil and political rights.

Independence and an attempt at self-government has not always brought stability to Latin-American countries, for several reasons. In the first place, the people lacked political experience. During the entire period of her empire, Spain never established or permitted a representative legislature in any of her American colonies, but instead built a tradition of strong executive authority with centralized initiative and direction. On this account conditions in the newly-freed nations were favorable for an occasional military coup or other form of revolt unseating a president and creating at least a tem-

porary dictatorship. A second reason was the lack of a middle class to bridge the gap between an oligarchy of rich citizens and a mass of destitute illiterate people. Finally, and perhaps the root cause, was an economic system with origins in feudalism which tended to perpetuate the inequalities. Latin American countries differ greatly in the extent to which they still suffer from this unfortunate political heritage. They are all affected by two newer influences: international advice and assistance to make their economies more efficient, as exemplified by the Alliance for Progress, and the efforts of Communist powers to persuade them that the road to plenty is through the dictatorship of the proletariat. Cuba exemplified the latter.

Early Asiatic Revolutions. In Asia, the constitutional movement made its way from Europe to Turkey in 1908, Persia in 1909, and China in 1911. Absolute monarchies were overthrown or limited by constitutional enactments and by the introduction of representative institutions. Pressure was building up in India for self-government and the rejection of British rule.

Governments and World War I. World War I brought to the surface much that had been germinating in secret. The empires of Central Europe and Russia disappeared. Through the disintegration of monarchical states, the number of nations increased.

Among other effects produced in these European states by World War I was a widening of democracy. The war had given an illustration of the possible power of governments over economic systems, which was reflected by the drift toward socialism in many constitutions. The New World felt these influences of the war much less than did Europe.

Rise of the New Autocracy. World War I and its after-effects led to a crisis in human government on a colossal scale. As early as 1848, Karl Marx issued the "Communist Manifesto," a landmark in an underground revolutionary movement based on the belief that the ills of an industrial society could be cured only if the laboring class seized power. War-shattered Russia proved ripe for application of the idea and fell under the spell and power of one of its ablest protagonists, Lenin. He established the first dictatorship of the proletariat with himself as dictator. Unlike tyrants of earlier ages, he had a program of social transformation for his country and all other countries as well. This program was pushed by a party organized publicly in Russia and secretly in other countries.

Predictably, the party's success in Russia and the threat it presented elsewhere struck terror in the hearts of rulers of other lands, particularly in countries seriously weakened by the war. Ostensibly to combat the new threat, Mussolini in Italy in 1922 and Hitler in Germany in 1933 overthrew their constitutional governments and assumed autocratic power with the assistance, in each case, of a party acting outside the law. In these two countries constitutional government was restored after their defeat in World War II, but the Russian influence was widened after that struggle, and a number of adjacent European countries fell within Russia's orbit as satellites. Finally, in 1949, a revolution in China brought that country also under a totalitarian regime dedicated to the doctrines of Karl Marx.

Twilight of the Empires. The unsettling effects of World War II, combined with the accelerating unification of the world by radio, television, and air travel, bore harvest in an almost universal demand for independence by peoples long subject to the control of other nations. A measure of its success appears in the fact that the United Nations, organized immediately after the war with 51 members, had by 1969 admitted a total of 126 new members, nearly all being countries which achieved independence after the war. Furthermore, in contrast with experience in earlier ages, all but two achieved their independence without warfare, the exceptions being Algeria and Viet-Nam.

The proliferation of new states offered a field day for the competing political ideals of constitutional government and the newer programs of Communist dictatorships. In general the new governments tended to adapt to their use the political institutions of their former rulers but usually chose republics on the American or French models. Their cultural and economic ties were usually retained, often with formal affiliation, as in the British Commonwealth or French Community. As in Latin America, however, the harsh realities of their economic life forced compromises, and many dictators appeared. But the Communists had a minimum of success in securing their adherence.

Some of the more forward-looking leaders of the new nations sought to advance their power collectively by federation. Egypt attempted to form an Arab super-state under the title of the United Arab Republic, but failed to achieve permanent success. Under the leadership of Ghana, an Organization of African Unity was formed by 30 countries in Addis Ababa in 1963 looking toward cooperative action.

Social Ideals in Politics. Parallel with the evolution of formal political development throughout the world, and speeded up by competition with the Communist revolution, has progressed a vast social movement designed to increase the well-being of the masses of the people and to secure a wider distribution of the proceeds of industry.

The free play of individual initiative, which theoretically accompanied modern democracy, is no longer permitted by even the most democratic governments. It is limited by a vast amount of "social legislation" supported by taxation, by organizations of workmen and employers, and by various forms of cooperation. Even governmental planning, the key operation under Communist rule, is resorted to and applied by means of differential tax rates and by credit policies with the objective of achieving the optimum economic growth.

Internationally, there has been a parallel development. By means of credit, technical assistance, and outright gifts, the better developed nations have sought to stimulate the economic progress of those nations emerging from more primitive economies. The motive has been partly to achieve political influence but partly also to forestall social disorder and the attendant dangers of warfare.

Politics and History. In thought, politics is often associated with history. But while history is, largely, the record of political activities, the two subjects differ widely in scope and in method. History surveys the past. The historian has the advantage of adequate accumulations of materials. He studies episodes and movements that are completed. He may separate himself from the partisanship and emotions of the time he describes. The student of politics does not have these advantages. He is dealing, primarily, not with the past, but with the present and with the future. His mind must be incessantly occupied with the morrow. Political sense comprises not only good judgment of actual events, but prescience for the future. Politics is not static, but dynamic; political forces are constantly altering, finding new directions, and attaining new balances. Institutions tend to constant change. The activity of the lawmaker is incessant. The materials for the study of politics thus constantly become obsolete and remain incomplete and unsatisfactory. Practical considerations of the highest importance, none the less, demand constant fresh examination of governments and policies and require the training of special faculties of the mind.

The Department of Politics of this work is divided into three parts. The first deals with the government of the United States, Federal, state, and local. In the second part are described the governments of foreign states, while the third part is composed of a dictionary of political terms and institutions.

THE UNITED STATES OF AMERICA

THE United States arose through the union of thirteen of the colonies of Great Britain in North America into a new nation under a federal form of government. This union was brought about by successive stages of development, after experiences with several forms of concerted action, and by a common protest and resistance to acts of the British king and Parliament.

Intercolonial Assemblies. This common resistance found expression in several intercolonial assemblies, first in the Stamp Act Congress (1765), which met at New York, was attended by delegates of nine colonies, and adopted a declaration of "rights and grievances," a petition to the king and a memorial and a petition to the House of Lords; second, by the First Continental Congress (1774), called by Massachusetts and Virginia and attended by delegates from all the colonies except Georgia. This Congress passed resolutions called the "Association" binding the colonies in a far-reaching boycott of British trade.

Independence of Colonies. The Second Continental Congress assembled after warfare had actually begun. It recruited a Continental army to resist the British forces, and appointed George Washington commander in chief. On July 4, 1776, it declared the independence of the colonies from Great Britain, and, in the absence of any more effectual organization, united the efforts of the colonies for the prosecution of the war until the adoption of the Articles of Confederation in 1781. The original Declaration of Independence is on display at the National Archives Exhibition Hall, Washington, D. C.

DECLARATION OF INDEPENDENCE

THE UNANIMOUS DECLARATION OF THE THIRTEEN UNITED STATES OF AMERICA, IN CONGRESS, JULY 4, 1776.

When, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume, among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident—that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that, whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute a new government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and, accordingly, all experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security. Such has been the patient sufferance of these colonies; and such is now the necessity which constrains them to alter their former systems of government. The history of the present king of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute tyranny over these states. To prove this, let facts be submitted to a candid world.

He has refused his assent to laws the most wholesome and necessary for the public good.

He has forbidden his governors to pass laws of immediate and pressing importance, unless suspended in their operations till his assent should be obtained; and, when so suspended, he has utterly neglected to attend them.

He has refused to pass other laws for the accommodation of large districts of people, unless these people would relinquish the right of representation in the legislature—a right inestimable to them, and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable and distant from the repository of their public records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved representative houses repeatedly, for opposing with manly firmness, his invasions on the rights of the people.

He has refused, for a long time after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large for their exercise; the state remaining in the meantime, exposed to all the dangers of invasion from without and convulsions within.

He has endeavored to prevent the population of these states; for that purpose obstructing the laws for the naturalization of foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new appropriations of lands.

He has obstructed the administration of justice, by refusing his assent to laws for establishing judiciary powers.

He has made judges dependent on his will alone for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers, to harass our people and eat out their substance.

He has kept among us, in times of peace, standing armies, without the consent of our legislatures.

He has affected to render the military independent of, and superior to, the civil power.

He has combined with others to subject us to a jurisdiction foreign to our constitutions and unacknowledged by our laws; giving his assent to their acts of pretended legislation:

For quartering large bodies of armed troops among us;

For protecting them, by a mock trial, from punishment for any murders which they should commit on the inhabitants of these states;

For cutting off our trade with all parts of the world;

For imposing taxes on us without our consent;

For depriving us, in many cases, of the benefits of trial by jury;

For transporting us beyond seas, to be tried for pretended offenses;

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute rule into these colonies;

For taking away our charters, abolishing our most valuable laws, and altering, fundamentally, the forms of our governments;

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated government here, by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burned our towns, and destroyed the lives of our people.

He is at this time transporting large armies of foreign mercenaries, to complete the works of death, desolation, and tyranny, already begun with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or to fall themselves by their hands.

He has excited domestic insurrection among us, and has endeavored to bring on the inhabitants of our frontiers the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes, and conditions.

In every stage of these oppressions we have petitioned for redress in the most humble terms: our repeated petitions have been answered only by repeated injury. A prince whose character is thus marked by every act which may define a tyrant is unfit to be the ruler of a free people.

Nor have we been wanting in our attentions to our British brethren. We have warned them, from time to time, of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity and we have conjured them by the ties of our common kindred, to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They, too, have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity which denounces our separation, and hold them as we hold the rest of mankind—enemies in war—in peace, friends.

We, therefore, the representatives of the United States of America, in general Congress assembled, appealing to

the Supreme Judge of the world for the rectitude of our intentions, do, in the name, and by the authority of the good people of these colonies, solemnly publish and declare that these united colonies are, and of right ought to be, free and independent states; that they are absolved from all allegiance to the British crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved; and that, as free and independent states, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which independent states may of right do. And for the support of this declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other our lives, our fortunes and our sacred honor.

The foregoing declaration was, by order of Congress, engrossed, and signed by the following members:

LYMAN HALL,

The Continental Congress. The defects of the Continental Congress as an agency for united effort were serious and were early apprehended. It rested on no constitution and commanded no support except as a revolutionary body. Its members represented the colonies from which they came, and voted under instructions, each state having one vote. The states regarded themselves as independent and able to disregard Congress when it appeared to their interest to do so.

The same session that produced the Declaration of Independence provided also a committee to draw up a plan for a better union. A committee was appointed which produced the Articles of Confederation, the first constitution of a united America. Nearly five years passed, however, before, on March 1, 1781, these articles became effective. The Congress did not adopt the committee's report until November 15, 1777. Eleven states ratified within a year following, but Delaware withheld ratification until 1779, and Maryland until 1781.

Articles of Confederation. As the precursor of the Constitution of the United States, the Articles of Confederation is a political document of first interest. As its name indicates, it provided for a "confederation," not for a "federal" government. It left the independence and the "sovereignty" of the thirteen states unimpaired (Article II). The states delegated certain powers to the national government; but, in spite of the use of the word "perpetual" in the document, they undoubtedly regarded themselves as possessing the right to withdraw if they desired.

The government created dealt only with the states. It could not act upon the individual. As in the Continental Congress, each state possessed one vote, and could send a number of "delegates," not less than two nor more than seven. These delegates the state chose and compensated in any desired manner (Article V). Action under the really important powers granted to the Congress required the assent of nine states to be effective (Article IX, 6th paragraph). The government created consisted only of the Congress, a single chamber body. A "president" was authorized (Article IX, 5th paragraph) to serve not "more than one year in any term of three," but he was simply a presiding officer. Executive functions were intrusted to "committees" of which a great number were eventually created. During recess a "Committee of the States," with one representative from each state, was authorized. To it was delegated a limited control.

The Congress had no independent power to enforce its measures. It was dependent upon the states for all resources and for troops; it had no courts nor officers to enforce its laws. Nevertheless, the government here created was an advance toward actual national union, and it furnished an experience essential to the final production of the constitution. The document in its entirety follows:

ARTICLES OF CONFEDERATION OF THE UNITED STATES OF AMERICA.

TO ALL TO WHOM THESE PRESENTS SHALL COME, WE THE UNDERSIGNED DELEGATES OF THE STATES AFFIXED TO OUR NAMES, SEND GREETING.

Whereas the delegates of the United States of America in Congress assembled did on the 15th day of November in the year of our Lord 1777, and in the second year of the independence of America agree to certain Articles of Confederation and perpetual union between the States of New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina and Georgia, in the words following, viz.

ARTICLES OF CONFEDERATION AND PERPETUAL UNION BETWEEN THE STATES OF NEW HAMPSHIRE, MASSACHUSETTS BAY, RHODE ISLAND AND PROVIDENCE PLANTATIONS, CONNECTICUT, NEW YORK, NEW JERSEY, PENNSYLVANIA, DELAWARE, MARYLAND, VIRGINIA, NORTH CAROLINA, SOUTH CAROLINA, AND GEORGIA.

ARTICLE I. The style of this confederacy shall be "The United States of America."

ARTICLE II. Each state retains its sovereignty, freedom and independence, and every power, jurisdiction and right, which is not by this confederation expressly delegated to the united states, in Congress assembled.

ARTICLE III. The said states hereby severally enter into a firm league of friendship with each other, for their common defense, the security of their liberties, and their mutual and general welfare, binding themselves to assist each other, against all force offered to, or attacks made upon them, or any of them, on account of religion, sovereignty, trade, or any other pretense whatever.

ARTICLE IV. The better to secure and perpetuate mutual friendship and intercourse among the people of the different states in this union, the free inhabitants of each of these states, paupers, vagabonds, and fugitives from justice excepted, shall be entitled to all privileges and immunities of free citizens in the several states; and the people of each state shall have free ingress and regress to and from any other state, and shall enjoy therein all the privileges of trade and commerce, subject to the same duties, impositions and restrictions as the inhabitants thereof respectively, provided that such restriction shall not extend so far as to prevent the removal of property imported into

any state, to any other state of which the owner is an inhabitant; provided also that no imposition, duties or restriction shall be laid by any state, on the property of the United States, or either of them.

If any person guilty of, or charged with treason, felony, or other high misdemeanor in any state, shall flee from justice, and be found in any of the united states, he shall upon demand of the Governor or executive power, of the state from which he fled, be delivered up and removed to the state having jurisdiction of his offense.

Full faith and credit shall be given in each of these states to the records, acts and judicial proceedings of the courts and magistrates of every other state.

ARTICLE V. For the more convenient management of the general interest of the united states, delegates shall be annually appointed in such manner as the legislature of each state shall direct, to meet in Congress on the first Monday in November, in every year, with a power reserved to each state, to recall its delegates, or any of them, at any time within the year, and to send others in their stead, for the remainder of the year.

No state shall be represented in Congress by less than two, nor by more than seven members; and no person shall be capable of being a delegate for more than three years in any term of six years; nor shall any person, being a delegate, be capable of holding any office under the united states, for which he, or another for his benefit receives any salary, fees or emolument of any kind.

Each state shall maintain its own delegates in any meeting of the states, and while they act as members of the committee of the states.

In determining questions in the united states, in Congress assembled, each state shall have one vote.

Freedom of speech and debate in Congress shall not be impeached or questioned in any court, or place out of Congress, and the members of Congress shall be protected in their persons from arrests and imprisonments, during the time of their going to and from, and attendance on Congress, except for treason, felony, or breach of the peace.

ARTICLE VI. No state without the consent of the united states in Congress assembled, shall send any embassy to, or receive any embassy from, or enter into any conference, agreement, alliance or treaty with any king, prince or state; nor shall any person holding any office of profit or trust under the united states, or any of them, accept of any present, emolument, office or title of any kind whatever from any king, prince or foreign state; nor shall the united states in Congress assembled, or any of them, grant any title of nobility.

No two or more states shall enter into any treaty, confederation or alliance whatever between them, without the consent of the united states in Congress assembled, specifying accurately the purposes for which the same is to be entered into, and how long it shall continue.

No state shall lay any imposts or duties, which may interfere with any stipulation in treaties, entered into by the united states in Congress assembled, with any king, prince or state, in pursuance of any treaties already proposed by Congress, to the courts of France and Spain.

No vessels of war shall be kept up in time of peace by any state, except such number only, as shall be deemed necessary by the united states in Congress assembled, for the defense of such state, or its trade; nor shall any body of forces be kept up by any state, in time of peace, except such number only, as in the judgment of the united states, in Congress assembled, shall be deemed requisite to garrison the forts necessary for the defense of such state; but every state shall always keep up a well regulated and disciplined militia, sufficiently armed and accoutred, and shall provide and have constantly ready for use, in public stores, a due number of field pieces and tents, and a proper quantity of arms, ammunition and camp equipage

No state shall engage in any war without the consent of the united states in Congress assembled, unless such state be actually invaded by enemies, or shall have received certain advice of a resolution being formed by some nation of Indians to invade such state, and the danger is so imminent as not to admit of a delay, till the united states in Congress assembled can be consulted: nor shall any state grant commissions to any ships or vessels of war, nor letters of marque or reprisal, except it be after a declaration of war by the united states in Congress assembled, and then only against the kingdom or state and the subjects thereof, against which war has been so declared, and under such regulations as shall be established by the united states in Congress assembled, unless such state be infested by pirates, in which case vessels of war may be fitted out for that occasion, and kept so long as the danger shall continue, or until the united states in Congress assembled shall determine otherwise.

ARTICLE VII. When land forces are raised by any state for the common defense, all officers of or under the rank of colonel, shall be appointed by the legislature of each state respectively by whom such forces shall be raised, or in such manner as such state shall direct, and all vacancies shall be filled up by the state which first made the appointment.

ARTICLE VIII. All charges of war, and all other expenses that shall be incurred for the common defense or general welfare, and allowed by the united states in Congress assembled, shall be defrayed out of a common treasury, which shall be supplied by the several states, in proportion to the value of all land within each state, granted to or surveyed for any person, as such land and the buildings and improvements thereon shall be estimated according to such mode as the united states in Congress assembled, shall from time to time, direct and appoint.

The taxes for paying that proportion shall be laid and levied by the authority and direction of the legislatures of the several states within the time agreed upon by the united states in Congress assembled.

ARTICLE IX. The united states in Congress assembled, shall have the sole and exclusive right and power of determining on peace and war, except in the cases mentioned in the sixth article—of sending and receiving ambassadors—entering into treaties and alliances, provided that no treaty of commerce shall be made whereby the legislative power of the respective states shall be restrained from imposing such imposts and duties on foreigners, as their own people are subjected to, or from prohibiting the exportation or importation of any species of goods or commodities whatsoever—of establishing rules for deciding in all cases, what captures on land or water shall be legal, and in what manner prizes taken by land or naval forces in the service of the united states shall be divided or appropriated—of granting letters of marque and reprisal in times of peace—appointing courts for the trial of piracies and felonies committed on the high seas and establishing courts for receiving and determining finally appeals in all cases of captures, provided that no member of Congress shall be appointed a judge of any of the said courts.

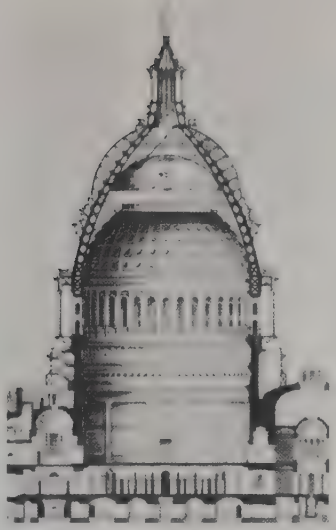
The united states in Congress assembled shall also be the last resort on appeal in all disputes and differences now subsisting or that hereafter may arise between two or more states concerning boundary, jurisdiction or any other cause whatever; which authority shall always be exercised in the manner following. Whenever the legislative or executive authority or lawful agent of any state in controversy with another shall present a petition to Congress, stating the matter in question and praying for a hearing, notice thereof shall be given by order of Congress to the legislative or executive authority of the other state in controversy, and a day assigned for the appearance of the parties by their lawful agents, who shall then be directed to appoint by joint consent, commissioners or judges to constitute a court for hearing and determining the matter in question: but if they cannot agree, Congress shall name three persons out of each of the united states, and from the list of such persons each party shall alternately strike out one, the petitioners beginning, until the number shall be reduced to thirteen; and from that number not less than seven, nor more than nine names as Congress shall direct, shall in the presence of Congress be drawn out by lot, and the persons whose names shall be so drawn or any five of them, shall be commissioners or judges, to hear and finally determine the controversy, so always as a major part of the judges who shall hear the cause shall agree in the determination: and if either party shall neglect to attend at the day appointed, without showing reasons, which Congress shall judge sufficient, or being present shall refuse to strike, the Congress shall proceed to nominate three persons out of each state, and the secretary of Congress shall strike in behalf of such party absent or refusing; and the judgment and sentence of the court to be appointed, in the manner before prescribed, shall be final and conclusive; and if any of the parties shall refuse to submit to the authority of such court, or to appear or defend their claim or cause, the court shall nevertheless proceed to pronounce sentence, or judgment, which shall in like manner be final and decisive, the judgment or sentence and other proceedings being in either case transmitted to Congress, and lodged among the acts of Congress for the security of the parties concerned: provided that every commissioner, before he sits in judgment, shall take an oath to be administered by one of the judges of the supreme or superior court of the state, where the cause shall be tried, "well and truly to hear and determine the matter in question, according to the best of his judgment, without favor, affection or hope of reward": provided also that no state shall be deprived of territory for the benefit of the united states.

All controversies concerning the private right of soil claimed under different grants of two or more states, whose jurisdictions as they may respect such lands, and the states which passed such grants are adjusted, the said grants or either of them being at the same time claimed to have originated antecedent to such settlement of jurisdiction, shall on the petition of either party to the Congress of the united states, be finally determined as near as may be in the same manner as is before prescribed for deciding disputes respecting territorial jurisdiction between different states.

The united states in Congress assembled shall also have the sole and exclusive right and power of regulating the alloy and value of coin struck by their own authority, or by

THE UNITED STATES CAPITOL, WASHINGTON, D.C. Combining classic and Renaissance design, the Capitol faces East in the section of Washington called Capitol Hill — 97 feet above the Potomac. The Capitol's length is 751 feet, 4 inches; its width 350 feet. The overall height is 307 feet, 6 inches. Topping the dome is a statue of Freedom. On September 13, 1793, the cornerstone was laid by George Washington. The wings, finished in 1811, were partially burned in 1814 by British forces attacking the city. In 1827 the central building was completed; the present dome, as pictured here, was finished in 1865. The original architect was William Thornton; his designs were later modified by Henry Latrobe and Charles Bulfinch.

ARCHITECT'S MODEL. Architect Thomas Walter's sketch in 1860 shows him judging elevation and profiles.



SKETCH OF NEW DOME. Architect projects conception to show relation to total structure.

THE DOME EVOLVES. Drawing of the dome as accepted.

THE DOME NEARS COMPLETION. In this picture a huge stone column is about to be hoisted into place on the Senate side.

THE CAPITOL, 1861. Less than a month after Lincoln was inaugurated the first time, the Civil War broke out and troops were called to protect the Capitol. Statuary for the Senate pediment and troops drilling on the east lawn were all part of the Capitol scene this May day of 1861.

that of the respective states—fixing the standard of weights and measures throughout the United States—regulating the trade and managing all affairs with the Indians, not members of any of the states, provided that the legislative right of any state within its own limits be not infringed or violated—establishing and regulating post offices from one state to another, throughout all the united states, and exacting such postage on the papers passing through the same as may be requisite to defray the expenses of the said office—appointing all officers of the land forces, in the service of the united states, excepting regimental officers—appointing all the officers of the naval forces, and commissioning all officers whatever in the service of the united states—making rules for the government and regulation of the said land and naval forces, and directing their operations.

The united states in Congress assembled shall have authority to appoint a committee, to sit in the recess of Congress, to be denominated "A Committee of the States," and to consist of one delegate from each state; and to appoint such other committees and civil officers as may be necessary for managing the general affairs of the united states under their direction—to appoint one of their number to preside, provided that no person be allowed to serve in the office of president more than one year in any term of three years; to ascertain the necessary sums of money to be raised for the service of the united states, and to appropriate and apply the same for defraying the public expenses—to borrow money, or emit bills on the credit of the united states, transmitting every half year to the respective states an account of the sums of money so borrowed or emitted—to build and equip a navy—to agree upon the number of land forces, and to make requisitions from each state for its quota, in proportion to the number of white inhabitants in such state; which requisition shall be binding, and thereupon the legislature of each state shall appoint the regimental officers, raise the men and clothe, arm and equip them in a soldierlike manner, at the expense of the united states; and the officers and men so clothed, armed and equipped shall march to the place appointed, and within the time agreed on by the united states in Congress assembled: But if the united states in Congress assembled shall, on consideration of circumstances judge proper that any state should not raise men, or should raise a smaller number than its quota, and that any other state should raise a greater number of men than the quota thereof, such extra number shall be raised, officered, clothed, armed and equipped in the same manner as the quota of such state, unless the legislature of such state shall judge that such extra number cannot be safely spared out of the same, in which case they shall raise, officer, clothe, arm and equip as many of such extra number as they judge can be safely spared. And the officers and men so clothed, armed and equipped, shall march to the place appointed, and within the time agreed on by the united states in Congress assembled.

The united states in Congress assembled shall never engage in a war, nor grant letters of marque and reprisal in time of peace, nor enter into any treaties or alliances, nor coin money, nor regulate the value thereof, nor ascertain the sums and expenses necessary for the defense and welfare of the united states, or any of them, nor emit bills, nor borrow money on the credit of the united states, nor appropriate money, nor agree upon the number of vessels of war, to be built or purchased, or the number of land or sea forces to be raised, nor appoint a commander in chief of the army or navy, unless nine states assent to the same: nor shall a question on any other point, except for adjourning from day to day be determined, unless by the votes of a majority of the united states in Congress assembled.

The Congress of the united states shall have power to adjourn to any time within the year, and to any place within the united states, so that no period of adjournment be for a longer duration than the space of six months, and shall publish the journal of their proceedings monthly, except such parts thereof relating to treaties, alliances or military operations, as in their judgment require secrecy; and the yeas and nays of the delegates of each state on any question shall be entered on the journal, when it is desired by any delegate; and the delegates of a state, or any of them, at his or their request shall be furnished with a transcript of the said journal, except such parts as are above excepted, to lay before the legislatures of the several states.

Article X. The committee of the states, or any nine of them, shall be authorized to execute, in the recess of Congress, such of the powers of Congress as the united states in Congress assembled, by the consent of nine states, shall from time to time think expedient to vest them with; provided that no power be delegated to said committee, for the exercise of which, by the Articles of Confederation, the voice of nine states in the Congress of the united states assembled is requisite.

Article XI Canada acceding to this Confederation, and joining in the measures of the united states shall be admitted into, and entitled to all the advantages of this union: but no other colony shall be admitted into the same, unless such admission be agreed to by nine states.

Article XII. All bills of credit emitted, moneys borrowed and debts contracted by, or under the authority of Congress, before the assembling of the united states, in pursuance of the present Confederation, shall be deemed and considered as a charge against the united states, for payment and satisfaction whereof the said united states, and the public faith are hereby solemnly pledged.

Article XIII. Every state shall abide by the determinations of the united states in Congress assembled, on all questions which by this Confederation is submitted to them. And the articles of this Confederation shall be inviolably observed by every state, and the union shall be perpetual; nor shall any alteration at any time hereafter be made in any of them; unless such alteration be agreed to in a Congress of the united states, and be afterwards confirmed by the legislatures of every state.

And whereas it hath pleased the Great Governor of the World to incline the hearts of the legislatures we respectively represent in Congress, to approve of, and to authorize us to ratify the said Articles of Confederation and perpetual union. Know ye that we the undersigned delegates, by virtue of the power and authority to us given for that purpose, do by these presents, in the name and in behalf of our respective constituents, fully and entirely ratify and confirm each and every of the said Articles of Confederation and perpetual union, and all and singular the matters and things therein contained: And we do further solemnly plight and engage the faith of our respective constituents, that they shall abide by the determinations of the united states in Congress assembled, on all questions which by the said Confederation are submitted to them. And that the articles thereof shall be inviolably observed by the states we respectively represent, and that the union shall be perpetual.

In witness whereof we have hereunto set our hands in Congress. Done at Philadelphia in the State of Pennsylvania the ninth day of July in the year of our Lord, 1778, and in the third year of the independence of America.

CONSTITUTION OF THE UNITED STATES

The unsatisfactory character of the union effected by the Articles of Confederation became increasingly apparent during the period of its existence. The Congress had no power to raise money by taxation. It could borrow, issue paper money, and make requisitions on the states; but the use of these ineffective powers only added to the financial difficulties and lowered the public credit. Congress sought the right to levy tariff duties, but the opposition of one or more states defeated this amendment.

The Constitutional Convention. The increasing gravity of American affairs, the growing probability of disruption, gradually convinced the people of the states of the need of a "more perfect union." A group of talented statesmen, led by Washington, Madison, Hamilton, and Franklin, worked unceasingly to this end, and in 1787 their labors were rewarded by the convention which met at Philadelphia in May and framed the Constitution of the United States.

Seventy-three delegates in all were appointed by the states, but only fifty-five ever attended. The average number present was from thirty to thirty-five, nearly all thoroughly experienced in public affairs and representative of the varying views of the states, while among them were a group of men distinguished for greatness of character and for political sagacity. Moreover, all were practical men, interested in effective forms of government, rather than in theoretical expedients. They were interested also in the protection of those ancient civil rights for which their race had contended for centuries, rather than in vague conceptions of political felicity.

Organization of Convention. The convention organized on May 25, and George Washington was unanimously chosen president. It adjourned on September 17. The convention met behind closed doors. It imposed a bond of secrecy on its members as to the differences and disputes which divided them, and this obligation of protecting the reputation of all concerned was never violated.

The journal of the convention was not published until 1818, when Congress so ordered. Nearly all that is known of the debates and adjustments of this meeting is derived from a private journal kept by Madison and first published in 1840. But it is apparent that no body of men intrusted with a comparable responsibility ever labored with greater disinterestedness and patriotism or strove in greater loyalty to bring the different views which separated them into a common agreement and workable plan.

The First Constitution. The Constitution, which is the first of modern constitutions in point of time, is easily the first also in the praise it has evoked and in the confidence of those who live under it. It may also be said that no political instrument ever framed embodies a more remarkable series of contributions to government or has exerted a wider influence on the subsequent history of states.

Among the institutions given original form in the Constitution are (1) Federal government, subsequently initiated in such widely different states as the Dominion of Canada, the Swiss Confederation, the German Empire, the Mexican and Argentine republics, and the Commonwealth of Australia; (2) the Senate, with its principle of equality of representation of member states as contrasted with a House of Representatives based on population; (3) the office of president, a plan of government which contrasts with ministerial or parliamentary executive as one of the two predominant types of national administration; (4) the supreme court, with its august and remarkable power of judicially interpreting the provisions of the Constitution itself, and of declaring void national or state legislation in conflict with the Constitution; (5) the creation of a sphere of constitutional liberty inviolable by government and protected by judicial power; (6) the creation of complete freedom of movement and of commerce within the union of states, subject only to Federal control.

Character of the Constitution. The Constitution is remarkable for the brevity and for the exactness of its language. While it is an instrument based on experience in government, extending over a long period of colonial and revolutionary statesmanship, its original character justifies the eulogy of Gladstone, that it is "the most wonderful work ever struck off at a given time by the brain and purpose of man."

In spite of the expansion of the United States since 1787 and the growth of the American people, the amendments to the Constitution have been relatively few and have little altered its original character as the first plan of the government. These amendments are 25 in number; their character and dates of adoption are as given below.

Ratification of Constitution. The Constitution was signed on September 17, 1787, by all members present except Mr. Gerry of Massachusetts and Mr. Mason and Mr. Randolph of Virginia. The president of the convention transmitted it to Congress and Congress on September 28 directed it to be "transmitted to the several legislatures in order to be submitted to a convention of delegates chosen in each state by the people thereof, in conformity to the resolves of the convention."

The Constitution was ratified by the thirteen original states in the following order:

Delaware, December 7, 1787, unanimously.
Pennsylvania, December 12, 1787, vote 46 to 23.
New Jersey, December 18, 1787, unanimously.
Georgia, January 2, 1788, unanimously.
Connecticut, January 9, 1788, vote 128 to 40.
Massachusetts, February 6, 1788, vote 187 to 168.
Maryland, April 28, 1788, vote 63 to 12.
South Carolina, May 23, 1788, vote 149 to 73.
New Hampshire, June 21, 1788, vote 57 to 46.
Virginia, June 25, 1788, vote 89 to 79.
New York, July 26, 1788, vote 30 to 28.
North Carolina, November 21, 1789, vote 193 to 75.
Rhode Island, May 29, 1790, vote 34 to 32.

The original document is on display at the National Archives Exhibition Hall, Washington, D. C.

Amendment of the Constitution. The Constitution (Article V) provides the method of its amendment. The initiative may come either from Congress by a two-thirds vote of both Houses, or by the applications of the legislatures of two-thirds of the states. An amendment thus legally proposed becomes a part of the Constitution when three-fourths of the states have ratified it. This ratification may be given either by the legislatures of the states or by conventions called for this purpose. The dates and circumstances occasioning the amendments are as follows:

Articles I–X were declared in force December 15, 1791.

The Constitution, as originally submitted, contained no code of fundamental civil rights. To make unequivocal the retention by the people or by the states of powers not expressly conferred upon the national government, these ten amendments were enacted by the first Congress and submitted to the states.

Article XI was declared in force January 8, 1798.

Article XII altered in some particulars the method of choosing the president and the vice president. It was ratified by all the states except Connecticut, Delaware, Massachusetts, and New Hampshire, which rejected it. It was declared in force September 25, 1804.

Article XIII, the emancipation amendment, was ratified by 31 of the 36 states; rejected by Delaware and Kentucky; not acted on by Texas; conditionally ratified by Alabama and Mississippi. Proclaimed December 18, 1865.

Article XIV, the reconstruction amendment, was ratified by 23 northern states; rejected by Kentucky,

Delaware, Maryland, and 5 southern states; and not acted on by California. New Jersey, Ohio, and Oregon withdrew ratification. The 5 southern states subsequently ratified under pressure. Proclaimed July 28, 1868.

Article XV, Negro citizenship amendment, was not acted on by Tennessee; rejected by California, Delaware, Kentucky, Maryland, New Jersey, and Oregon. It was ratified by the remaining 30 states; New York rescinded its ratification January 5, 1870. Proclaimed March 30, 1870.

Article XVI, income tax amendment, was ratified by 39 states. It was proclaimed February 25, 1913.

Article XVII, providing for the direct election of senators, became *de facto* a part of the Constitution on its ratification by the last of the required number of states on April 8, 1913.

Article XVIII, the prohibition amendment, had on January 16, 1919, been ratified by 36 states, and on January 29, 1919, was formally proclaimed to take effect on January 16, 1920. Connecticut and Rhode Island alone failed to ratify.

Article XIX, the equal suffrage amendment, was adopted between June 10, 1919, and August 19, 1920, by three-fourths of the states, and proclaimed in effect August 26, 1920.

Article XX, the "lame duck" amendment, had been ratified by 39 states by February 6, 1933, when it was proclaimed valid.

Article XXI, repealing the prohibition amendment, article *XVIII*, was ratified by the 36th state, Utah, on December 5, 1933, and was immediately proclaimed valid.

Article XXII, limiting presidential terms of office to two. Went into effect February 26, 1951.

Article XXIII, enabling the District of Columbia to choose presidential electors on the same basis of representation as the states. Went into effect April 3, 1961.

Article XXIV, forbidding disqualification for voting which is based on failure to pay any poll or other tax. Became effective January 23, 1964.

Article XXV, providing for succession to presidency and vice presidency. Became effective February 10, 1967.

CONSTITUTION OF THE UNITED STATES

PEAMBLE.—We, the people of the United States, in order to form a more perfect Union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America.

ARTICLE I

SECTION I. All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

SECTION II. 1. The House of Representatives shall be composed of members chosen every second year by the people of the several states, and the electors in each state shall have the qualifications requisite for electors of the most numerous branch of the state legislature.

2. No person shall be a representative who shall not have attained to the age of twenty-five years, and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that state in which he shall be chosen.

3. Representatives and direct taxes shall be apportioned among the several states which may be included within this Union, according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of representatives shall not exceed one for every thirty thousand, but each state shall have at least one representative; and until such enumeration shall be made, the state of New Hampshire shall be entitled to choose 3; Massachusetts, 8; Rhode Island and Providence Plantations, 1; Connecticut, 5; New York, 6; New Jersey, 4; Pennsylvania, 8; Delaware, 1; Maryland, 6; Virginia, 10; North Carolina, 5; South Carolina, 5; and Georgia, 3. See *Article XIV., Amendment.*

4. When vacancies happen in the representation from any state, the executive authority thereof shall issue writs of election to fill such vacancies.

5. The House of Representatives shall choose their speaker and other officers; and shall have the sole power of impeachment.

SECTION III. 1. The Senate of the United States shall be composed of two senators from each state, chosen by the legislature thereof, for six years; and each senator shall have one vote (Superseded by the 17th Amendment).

2. Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one-third may be chosen every second year; and if vacancies happen by resignation, or otherwise, during the recess of the legislature of any state, the executive thereof may make temporary appointments until the next meeting of the legislature, which shall then fill such vacancies.

3. No person shall be a senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that state for which he shall be chosen.

4. The vice president of the United States shall be president of the Senate, but shall have no vote, unless they be equally divided.

5. The Senate shall choose their other officers, and also a president pro tempore, in the absence of the vice president, or when he shall exercise the office of president of the United States.

6. The Senate shall have the sole power to try all impeachments. When sitting for that purpose, they shall be on oath or affirmation. When the president of the United States is tried, the chief justice shall preside: and no person shall be convicted without the concurrence of two-thirds of the members present.

7. Judgment in cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law.

SECTION IV. 1. The times, places, and manner of holding elections for senators and representatives shall be prescribed in each state by the legislature thereof; but the Congress may at any time by law make or alter such regulations, except as to the places of choosing senators.

2. The Congress shall assemble at least once in every year, and such meeting shall be on the first Monday in December, unless they shall by law appoint a different day.

SECTION V. 1. Each House shall be the judge of the elections, returns, and qualifications of its own members, and a majority of each shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members, in such manner, and under such penalties as each House may provide.

2. Each House may determine the rules of its proceedings, punish its members for disorderly behavior, and, with the concurrence of two-thirds, expel a member.

3. Each House shall keep a journal of its proceedings, and from time to time publish the same, excepting such parts as may in their judgment require secrecy; and the yeas and nays of the members of either House on any question shall, at the desire of one-fifth of those present, be entered on the journal.

4. Neither House, during the session of Congress, shall, without the consent of the other, adjourn for more than three days, nor to any other place than that in which the two Houses shall be sitting.

SECTION VI. 1. The senators and representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the treasury of the United States. They shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the session of their respective Houses, and in going to and returning from the same; and for any speech or debate in either House, they shall not be questioned in any other place.

2. No senator or representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States, which shall have been created, or the emoluments whereof shall have been increased, during such time; and no person holding any office under the United States, shall be a member of either House during his continuance in office.

SECTION VII. 1. All bills for raising revenue shall originate in the House of Representatives; but the Senate may propose or concur with amendments as on other bills.

2. Every bill which shall have passed the House of Representatives and the Senate, shall, before it become a law, be presented to the president of the United States; if he approve he shall sign it, but if not he shall return it, with his objections, to that House in which it shall have originated, who shall enter the objections at large on their journal, and proceed to reconsider it. If after such reconsideration two-thirds of that House shall agree to pass the bill, it shall be sent, together with the objections, to the other House, by which it shall likewise be reconsidered, and, if approved by two-thirds of that House, it shall become a law. But in all such cases the votes of both Houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each House respectively. If any bill shall not be returned by the president within ten days (Sundays excepted) after it shall have been presented to him, the same shall be a law, in like manner as if he had signed it, unless the Congress by their adjournment prevent its return, in which case it shall not be a law.

3. Every order, resolution, or vote to which the concurrence of the Senate and House of Representatives may be necessary (except on a question of adjournment) shall be presented to the president of the United States; and before the same shall take effect, shall be approved by him, or being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the rules and limitations prescribed in the case of a bill.

SECTION VIII. The Congress shall have power:

1. To lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States.

2. To borrow money on the credit of the United States.

3. To regulate commerce with foreign nations, and among the several states, and with the Indian tribes.

4. To establish an uniform rule of naturalization, and uniform laws on the subject of bankruptcies throughout the United States.

5. To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures.

6. To provide for the punishment of counterfeiting the securities and current coin of the United States.

7. To establish post offices and post roads.

8. To promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.

9. To constitute tribunals inferior to the supreme court.

10. To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations.

11. To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water.

12. To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years.

13. To provide and maintain a navy.

14. To make rules for the government and regulation of the land and naval forces.

15. To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions.

16. To provide for organizing, arming, and disciplining, the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the states respectively, the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress.

17. To exercise exclusive legislation in all cases whatsoever, over such district (not exceeding ten miles square) as may, by cession of particular states, and the acceptance of Congress, become the seat of the government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the state in which the same shall be, for the erection of forts, magazines, arsenals, dockyards, and other needful buildings.

18. To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the government of the United States, or in any department or officer thereof.

SECTION IX. 1. The migration or importation of such persons as any of the states now existing shall think proper to admit, shall not be prohibited by the Congress prior to the year one thousand eight hundred and eight, but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person.

2. The privilege of the writ of habeas corpus shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it.

3. No bill of attainder or ex post facto law shall be passed.

4. No capitation, or other direct, tax shall be laid, unless in proportion to the census or enumeration hereinbefore directed to be taken (Changed by the 16th Amendment).

5. No tax or duty shall be laid on articles exported from any state.

6. No preference shall be given by any regulation of commerce or revenue to the ports of one state over those of another: nor shall vessels bound to, or from, one state be obliged to enter, clear, or pay duties in another.

7. No money shall be drawn from the treasury, but in consequence of appropriations made by law; and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time.

8. No title of nobility shall be granted by the United States: And no person holding any office of profit or trust under them, shall, without the consent of the Congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign state.

SECTION X. 1. No state shall enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money; emit bills of credit; make anything but gold and silver coin a tender in payment of debts; pass any bill of attainder, ex post facto law, or law impairing the obligation of contracts, or grant any title of nobility.

2. No state shall, without the consent of the Congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws: and the net produce of all duties and imposts, laid by any state on imports or exports, shall be for the use of the treasury of the United States; and all such laws shall be subject to the revision and control of the Congress.

3. No state shall, without the consent of Congress, lay any duty of tonnage, keep troops, or ships of war in time of peace, enter into any agreement or compact with another state, or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.

ARTICLE II

SECTION I. 1. The executive power shall be vested in a president of the United States of America. He shall hold his office during the term of four years, and, together with the vice president, chosen for the same term, be elected as follows.

2. Each state shall appoint, in such manner as the legislature thereof may direct, a number of electors, equal to the whole number of senators and representatives to which the state may be entitled in the Congress: but no senator or representative, or person holding an office of trust or profit under the United States, shall be appointed an elector.

3. The electors shall meet in their respective states, and vote by ballot for two persons, of whom one at least shall not be an inhabitant of the same state with themselves. And they shall make a list of all the persons voted for, and of the number of votes for each; which list they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the president of the Senate. The president of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted. The person having the greatest number of votes shall be the president, if such number be a majority of the whole number of electors appointed; and if there be more than one who have such majority, and have an equal number of votes, then the House of Representatives shall immediately choose by ballot one of them for president; and if no person have a majority, then from the five highest on the list the said House shall in like manner choose the president. But in choosing the president, the vote shall be taken by states, the representation for each state having one vote; A quorum for this purpose shall consist of a member or members from two-thirds of the states, and a majority of all the states shall be necessary to a choice. In every case, after the choice of the president, the person having the greatest number of votes of the electors shall be the vice president. But if there should remain two or more who have equal votes, the Senate shall choose from them by ballot the vice president (Superseded by the 12th Amendment).

4. The Congress may determine the time of choosing the electors, and the day on which they shall give their votes; which day shall be the same throughout the United States.

5. No person except a natural born citizen, or a citizen of the United States, at the time of the adoption of this Constitution, shall be eligible to the office of president; neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years, and have been fourteen years a resident within the United States.

6. In case of the removal of the president from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the vice president, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the president and vice president, declaring what officer shall then act as president, and such officer shall act accordingly, until the disability be removed, or a president shall be elected.

7. The president shall, at stated times, receive for his services, a compensation, which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period

any other emolument from the United States, or any of them.

8. Before he enter on the execution of his office, he shall take the following oath or affirmation:—

"I do solemnly swear (affirm) that I will faithfully execute the office of President of the United States, and will, to the best of my ability, preserve, protect, and defend the Constitution of the United States."

SECTION II. 1. The president shall be commander in chief of the army and navy of the United States, and of the militia of the several states, when called into the actual service of the United States; he may require the opinion, in writing, of the principal officer in each of the executive departments, upon any subject relating to the duties of their respective offices, and he shall have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment.

2. He shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the senators present concur; and he shall nominate, and by and with the advice and consent of the Senate, shall appoint ambassadors, other public ministers and consuls, judges of the supreme court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law: but the Congress may by law vest the appointment of such inferior officers, as they think proper, in the president alone, in the courts of law, or in the heads of departments.

3. The president shall have power to fill up all vacancies that may happen during the recess of the Senate, by granting commissions which shall expire at the end of their next session.

SECTION III. He shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may, on extraordinary occasions, convene both Houses, or either of them, and in case of disagreement between them, with respect to the time of adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers; he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

SECTION IV. The president, vice president, and all civil officers of the United States shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors.

ARTICLE III

SECTION I. The judicial power of the United States, shall be vested in one supreme court, and in such inferior courts as the Congress may from time to time ordain and establish. The judges, both of the supreme and inferior courts, shall hold their offices during good behavior, and shall, at stated times, receive for their services, a compensation, which shall not be diminished during their continuance in office.

SECTION II. 1. The judicial power shall extend to all cases, in law and equity, arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority;—to all cases affecting ambassadors, other public ministers and consuls;—to all cases of admiralty and maritime jurisdiction;—to controversies to which the United States shall be a party;—to controversies between two or more states;—between a state and citizens of another state;—between citizens of different states;—between citizens of the same state claiming lands under grants of different states,—and between a state, or the citizens thereof, and foreign states, citizens, or subjects.

2. In all cases affecting ambassadors, other public ministers and consuls, and those in which a state shall be party, the supreme court shall have original jurisdiction. In all the other cases before mentioned, the supreme court shall have appellate jurisdiction, both as to law and fact, with such exceptions, and under such regulations as the Congress shall make.

3. The trial of all crimes, except in cases of impeachment shall be by jury; and such trial shall be held in the state where the said crimes shall have been committed; but when not committed within any state, the trial shall be at such place or places as the Congress may by law have directed

SECTION III. 1. Treason against the United States, shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court.

2. The Congress shall have power to declare the punishment of treason, but no attainder of treason shall work corruption of blood, or forfeiture except during the life of the person attainted.

ARTICLE IV

SECTION I. Full faith and credit shall be given in each state to the public acts, records, and judicial proceedings of every other state. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

SECTION II. 1. The citizens of each state shall be entitled to all privileges and immunities of citizens in the several states.

2. A person charged in any state with treason, felony, or other crime, who shall flee from justice, and be found in another state, shall on demand of the executive authority of the state from which he fled, be delivered up, to be removed to the state having jurisdiction of the crime.

3. No person held to service or labor in one state, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.

SECTION III. 1. New states may be admitted by the Congress into this Union; but no new state shall be formed or erected within the jurisdiction of any other state; nor any state be formed by the junction of two or more states, or parts of states, without the consent of the legislatures of the states concerned as well as of the Congress.

2. The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this Constitution shall be so construed as to prejudice any claims of the United States, or of any particular state.

SECTION IV. The United States shall guarantee to every state in this Union a republican form of government, and shall protect each of them against invasion; and on application of the legislature, or of the executive (when the legislature cannot be convened) against domestic violence.

ARTICLE V

The Congress, whenever two-thirds of both Houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the legislatures of two-thirds of the several states, shall call a convention for proposing amendments, which, in either case, shall be valid to all intents and purposes, as part of this Constitution, when ratified by the legislatures of three-fourths of the several states, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided that no amendment which may be made prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in the Ninth Section of the First Article; and that no state, without its consent, shall be deprived of its equal suffrage in the Senate.

ARTICLE VI

1. All debts contracted and engagements entered into before the adoption of this Constitution, shall be as valid against the United States under this Constitution, as under the Confederation.

2. This Constitution, and the laws of the United States which shall be made in pursuance thereof; and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every state shall be bound thereby, anything in the Constitution or laws of any state to the contrary notwithstanding.

3. The senators and representatives before mentioned, and the members of the several state legislatures, and all executive and judicial officers, both of the United States and of the several states, shall be bound by oath or affirmation, to support this Constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

ARTICLE VII

The ratification of the conventions of nine states, shall be sufficient for the establishment of this Constitution between the states so ratifying the same.

Done in convention by the unanimous consent of the states present the seventeenth day of September in the year of our Lord one thousand seven hundred and eighty-seven, and of the independence of the United States of America the twelfth. In witness whereof we have hereunto subscribed our names,

AMENDMENTS TO THE CONSTITUTION

** Date when declared ratified by a sufficient number of states.*

ARTICLE I

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the government for a redress of grievances.

ARTICLE II

A well regulated militia, being necessary to the security of a free state, the right of the people to keep and bear arms, shall not be infringed.

ARTICLE III

No soldier shall, in time of peace, be quartered in any house, without the consent of the owner, nor in time of war, but in a manner to be prescribed by law.

ARTICLE IV

The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures shall not be violated, and no warrants shall issue, but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V

No person shall be held to answer for a capital, or otherwise infamous crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service in time of war or public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation.

ARTICLE VI

In all criminal prosecutions the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the state and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

ARTICLE VII

In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States, than according to the rules of the common law.

ARTICLE VIII

Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

ARTICLE IX

The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people.

ARTICLE X

The powers not delegated to the United States by the Constitution, nor prohibited by it to the states, are reserved to the states respectively, or to the people.

** The first ten amendments (Bill of Rights) were declared in force December 15, 1791.*

ARTICLE XI

The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States, by citizens of another state, or by citizens or subjects of any foreign state. ** January 8, 1798*

ARTICLE XII

The electors shall meet in their respective states, and vote by ballot for president and vice president, one of whom, at least, shall not be an inhabitant of the same state with themselves; they shall name in their ballots the person voted for as president, and in distinct ballots the person voted for as vice president, and they shall make distinct lists of all persons voted for as president, and of all persons voted for as vice president, and of the number of votes for each, which list they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the president of the Senate;—the president of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted; —the person having the greatest number of votes for president, shall be the president, if such number be a majority of the whole number of electors appointed; and if no person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as president, the House of Representatives shall choose immediately, by ballot, the president. But in choosing the president, the votes shall be taken by states, the representation from each state having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the states, and a majority of all the states shall be necessary to a choice. And if the House of Representatives shall not choose a president whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the vice president shall act as president, as in the case of the death or other constitutional disability of the president. The person having the greatest number of votes as vice president, shall be the vice president, if such number be a majority of the whole number of electors appointed, and if no person have a majority, then from the two highest numbers on the list, the Senate shall choose the vice president; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of president shall be eligible to that of vice president of the United States. **September 25, 1804*

ARTICLE XIII

1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

2. Congress shall have power to enforce this article by appropriate legislation. **December 18, 1865*

ARTICLE XIV

1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the state wherein they reside. No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

2. Representatives shall be apportioned among the several states according to their respective numbers, counting the whole number of persons in each state, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for president and vice president of the United States, representatives in Congress, the executive and judicial officers of a state, or the members of the legislature thereof, is denied to any of the male inhabitants of such state, being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion, or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such state.

3. No person shall be a senator or representative in Congress, or elector of president and vice president, or hold any office, civil or military, under the United States, or under any state, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any state legislature, or as an executive or judicial officer of any state, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may by a vote of two-thirds of each House, remove such disability.

4. The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any state shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article. **July 28, 1868*

ARTICLE XV

1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.

2. The Congress shall have power to enforce this article by appropriate legislation. **March 30, 1870*

ARTICLE XVI

The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several states, and without regard to any census or enumeration. **February 25, 1913*

ARTICLE XVII

The Senate of the United States shall be composed of two senators from each state, elected by the people thereof, for six years, and each senator shall have one vote. The electors in each state shall have the qualifications requisite for electors of the most numerous branch of the state legislatures.

When vacancies happen in the representation of any state in the Senate, the executive authority of such state shall issue writs of election to fill such vacancies: Provided, that the legislature of any state may empower the executive thereof to make temporary appointments until the people fill the vacancies by election as the legislature may direct.

This amendment shall not be so construed as to affect the election or term of any senator chosen before it becomes valid as part of the Constitution. **May 31, 1913*

ARTICLE XVIII

1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof, for beverage purposes, is hereby prohibited.

2. The Congress and the several states shall have concurrent power to enforce this article by appropriate legislation.

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of the several states, as provided in the Constitution, within seven years from the date of submission hereof to the states by the Congress. **January 29, 1919*

ARTICLE XIX

1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of sex.

2. Congress shall have power, by appropriate legislation, to enforce the provisions of this article. **August 26, 1920*

ARTICLE XX

1. The terms of the president and vice president shall end at noon on the 20th day of January, and the terms of senators and representatives at noon on the 3d day of January, of the years in which such terms would have ended if this article had not been ratified; and the terms of their successors shall then begin.

2. The Congress shall assemble at least once in every year, and such meeting shall begin at noon on the 3d day of January, unless they shall by law appoint a different day.

3. If, at the time fixed for the beginning of the term of the president, the president elect shall have died, the vice president elect shall become president. If a president shall not have been chosen before the time fixed for the beginning of his term, or if the president elect shall have failed to qualify, then the vice president elect shall act as president until a president shall have qualified; and the Congress may by law provide for the case wherein neither a president elect nor a vice president elect shall have qualified, declaring who shall then act as president, or the manner in which one who is to act shall be selected, and such person shall act accordingly until a president or vice president shall have qualified.

4. The Congress may by law provide for the case of the death of any of the persons from whom the House of Representatives may choose a president whenever the right of choice shall have devolved upon them, and for the case of the death of any of the persons from whom the Senate may choose a vice president whenever the right of choice shall have devolved upon them. **February 6, 1933*

ARTICLE XXI

1. The 18th article of amendment to the Constitution of the United States is hereby repealed.

2. The transportation or importation into any state, territory, or possession of the United States for delivery or use therein of intoxicating liquors, in violation of the laws thereof, is hereby prohibited.

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by conventions in the several states, as provided in the Constitution, within seven years from the date of the submission thereof, to the states by the Congress. **Dec. 5, 1933*

ARTICLE XXII

1. No person shall be elected to the office of the President more than twice, and no person who has held the office of President, or acted as President, for more than two years of a term to which some other person was elected President shall be elected to the office of the President more than once. But this article shall not apply to any person holding the office of President when this article was proposed by the Congress, and shall not prevent any person who may be holding the office of President, or acting as President, during the term within which this article becomes operative from holding the office of President or acting as President during the remainder of such term.

2. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislators of three fourths of the several states within seven years from the date of its submission to the states by the Congress. **February 26, 1951*

ARTICLE XXIII

1. The District constituting the seat of government of the United States shall appoint in such manner as the Congress may direct:

A number of electors of President and Vice President equal to the whole number of Senators and Representatives in Congress to which the District would be entitled if it were a State, but in no event more than the least populous State; they shall be in addition to those appointed by the States, but they shall be considered, for the purpose of the election of President and Vice President, to be electors appointed by a State; and they shall meet in the District and perform such duties as provided by the twelfth article of amendment.

2. The Congress shall have power to enforce this article by appropriate legislation. **April 3, 1961*

ARTICLE XXIV

1. The right of the citizens of the United States to vote in any primary or other election for President or Vice President, for electors for President or Vice President, or for Senator or Representative in Congress, shall not be denied or abridged by the United States or any State by reasons of failure to pay any poll tax or any other tax.

2. The Congress shall have power to enforce this article by appropriate legislation. **January 23, 1964*

ARTICLE XXV

1. In case of the removal of the President from office or of his death or resignation, the Vice President shall become President.

2. Whenever there is a vacancy in the office of the Vice President, the President shall nominate a Vice President who shall take office upon confirmation by a majority vote of both houses of Congress.

3. Whenever the President transmits to the President pro tempore of the Senate and the Speaker of the House of Representatives his written declaration that he is unable to discharge the powers and duties of his office, and until he transmits to them a written declaration to the contrary, such powers and duties shall be discharged by the Vice President as acting President.

4. Whenever the Vice President and a majority of either the principal officers of the executive departments or of such other body as Congress may by law provide transmit to the President pro tempore of the Senate and the Speaker of the House of Representatives their written declaration that the President is unable to discharge the powers and duties of his office, the Vice President shall immediately assume the powers and duties of the office as acting President.

Thereafter, when the President transmits to the President pro tempore of the Senate and the Speaker of the House of Representatives his written declaration that no inability exists, he shall resume the powers and duties of his office unless the Vice President and a majority of either the principal officers of the executive departments or of such other body as Congress may by law provide transmit within four days to the President pro tempore of the Senate and the Speaker of the House of Representatives their written declaration that the President is unable to discharge the powers and duties of his office. Thereupon Congress shall decide the issue, assembling within forty-eight hours for that purpose if not in session. If the Congress, within twenty-one days after receipt of the latter written declaration, or, if Congress is not in session within twenty-one days after Congress is required to assemble, determines by two thirds vote of both houses that the President is unable to discharge the powers and duties of his office, the Vice President shall continue to discharge the same as acting President: otherwise, the President shall resume the powers and duties of his office. **February 10, 1967*

ARTICLE XXVI

1. The right of citizens of the United States, who are eighteen years of age or older, to vote shall not be denied or abridged by the United States or any state on account of age.

2. The Congress shall have the power to enforce this article by appropriate legislation. **July 5, 1971*

THE FEDERAL GOVERNMENT

THE LEGISLATIVE DEPARTMENT

THE CONGRESS

Consisting of both the Senate and the House of Representatives as coordinate bodies.

DURATION.—The term of each Congress is for two years, beginning January 3 of the odd years.

REGULAR SESSIONS.—Annual, beginning at noon on January 3.

SPECIAL SESSIONS.—At the call of the president.

MEMBERSHIP.—Each House is the judge of the elections and qualifications of its own members.

The Senate

NUMBER.—Two senators from each state.

ELECTED.—By direct vote of the people.

TERM.—Six years; one-third of the Senate being elected every two years.

ELIGIBILITY.—Citizen of the United States nine years; resident of state; minimum age, 30 years.

SALARY.—$57,500 per year.

PRESIDENT OF THE SENATE.—The vice president of the United States.

POWERS OF THE SENATE.—

- Confirms or rejects nominations of the president.
- Ratifies or rejects treaties with foreign powers.
- Elects president *pro tempore* of the Senate, and its other officers.
- Elects vice president of the United States if regular election fails.
- Acts as a court for the trial of impeachments.

The House of Representatives

NUMBER.—Four hundred thirty-five members.*

ELECTED.—By voters of congressional districts.

TERM.—Two years—the entire House being elected every two years.

ELIGIBILITY.—Citizen of the United States seven years; resident of the state; minimum age 25 years.

SALARY.—$57,500 per year; the speaker, $75,000 per year.

POWERS OF THE HOUSE OF REPRESENTATIVES.—

- Elects its speaker (presiding officer) and its other officers.
- Elects president of the United States if the regular election fails.
- Prosecutes impeachments before the Senate.
- Originates all bills for raising revenue.

*There are besides a resident commissioner from Puerto Rico and delegates from the Virgin Islands, the District of Columbia, and Guam who have the right to take part in floor discussions and to vote in the committees to which they are assigned, but they cannot vote on the floor of the House.

THE EXECUTIVE DEPARTMENT

THE PRESIDENT

HOW ELECTED.—In several steps as follows:

- State electors are chosen at a general election held on the Tuesday following the first Monday of November of every fourth year, the number of electors of each state being equal to the number of senators and representatives to which the state is entitled in Congress. The date of the election was fixed by act of Congress in 1845.
- The electors meet in their respective states on December 15 and vote by ballot for president and vice president; at the same time they make certificates of their vote and transmit the same to the president of the Senate.
- The Senate and the House of Representatives meet jointly and count the votes of the state electors, when, if there is an election, the president of the Senate declares who are elected president and vice president.
- In case there is no choice by the state electors, the president is elected by the House of Representatives from the three candidates who received the most electoral votes for president, in which election the vote is taken by states, each state having but one vote, and a majority of all the states being necessary to a choice.

TERM OF OFFICE.—Four years, from January 20.

ELIGIBILITY.—A natural born citizen; resident of the United States 14 years; minimum age, 35.

SALARY.—$200,000 a year.

POWERS AND DUTIES OF THE PRESIDENT.—

- Commander in chief of the armed services.
- Receives representatives of foreign governments.
- Communicates with Congress by message.
- Approves (signs) or disapproves (vetoes) acts of Congress. See *Law, Enactment of*.
- Calls and adjourns special sessions of Congress.
- Makes treaties with advice and consent of the Senate.
- Appoints public officers with the advice and consent of the Senate.
- Commissions public officers of the United States.
- Grants reprieves and pardons for offenses against the United States.

The Vice President

HOW CHOSEN.—Elected by state electors the same as the president; or by the Senate, in case there is no choice by the state electors. Vacancy filled by nomination by president, confirmed by a majority vote of both houses.

TERM AND ELIGIBILITY.—Same as for president.

SALARY.—$75,000 a year.

THE PRESIDENTIAL SUCCESSION.—In case of the removal, death, or resignation of the president, the vice president takes the president's place; in case of the president's disability, the vice president serves as acting president during the period of the president's disability. If presidency and vice presidency are both vacant, the order of succession to the presidency is (1) speaker of the House, (2) president pro tempore of the Senate, (3) heads of executive departments in order given below, each being subject to constitutional requirements of eligibility.

The Executive Departments

DEPARTMENT OF STATE.—Has charge of foreign affairs.

TREASURY DEPARTMENT.—Has charge of fiscal affairs.

DEPARTMENT OF DEFENSE.—Has charge of the national defense forces: army, navy, and air force.

DEPARTMENT OF JUSTICE.—Has charge of the legal affairs of the government.

DEPARTMENT OF THE INTERIOR.—Has charge of domestic affairs, including public lands, pensions.

DEPARTMENT OF AGRICULTURE.—Has charge of agricultural affairs, etc.

DEPARTMENT OF COMMERCE.—Has charge of domestic and foreign affairs relating to commerce, transportation, supervision of Weather Bureau, etc.

DEPARTMENT OF LABOR.—Has charge of labor affairs and naturalization.

DEPARTMENT OF HEALTH, EDUCATION AND WELFARE.—Has charge of public health service, office of education, social security administration.

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT.—Has charge of public housing, mortgage insurance, planning for city development and transportation.

DEPARTMENT OF TRANSPORTATION.—Has charge of safety and promotion in air, rail, highway, and pipe line transportation, but not navigation.

U.S. POSTAL SERVICE.—Formerly a cabinet-level department, in 1971 it was made a government-owned, independently operating, nonprofit corporation within the executive department.

The Cabinet

MEMBERS.—Heads of the executive departments.

APPOINTMENT.—By the president with the advice and consent of the Senate.

SALARY.—All cabinet members, $66,000 annually.

THE JUDICIAL DEPARTMENT

JUDGES OF THE UNITED STATES COURTS

APPOINTMENT.—By the president with the advice and consent of the Senate.

TENURE OF OFFICE.—During life or good behavior; but may retire on full salary at 70 and 10 years' service or 65 and 15 years' service.

THE SUPREME COURT OF THE UNITED STATES

MEMBERS.—One chief justice; eight associate justices.

SALARIES.—Chief justice, $75,000; associate justices, each, $72,000.

TERMS OF COURT.—One each year, beginning on the second Monday in October.

ORIGINAL JURISDICTION.—In all cases affecting ambassadors, ministers, and consuls, and in all cases in which a state is a party.

APPELLATE JURISDICTION.—In cases of law and equity where the inferior courts have original jurisdiction, with such exceptions and regulations as Congress has made.

THE CHIEF JUSTICE.—Presides over the Senate when it sits as a court of impeachment for the trial of the president.

INFERIOR COURTS

JURISDICTION:

In cases between citizens of different states.
In cases in which the United States is a party.
In cases of admiralty and maritime jurisdiction.
In trials for crimes against the United States; but the trial of crimes must be by jury, and must be held in the state where the crime was committed.
Appeals to the Supreme Court may be had in all cases of law and equity, with such exceptions and regulations as Congress has made.

United States Circuit Courts of Appeals:

Organized in 1891 to relieve the United States Supreme Court in appellate cases.

NUMBER.—One in each of the ten judicial circuits and one in the District of Columbia.

SALARIES.—$57,500 annually.

MEMBERS.—Three judges: the chief justice, or the associate justice assigned to the circuit, or any circuit or district judge within the circuit, is competent to sit.

United States District Courts:

NUMBER OF DISTRICTS.—One or more in each state and territory. At present there are ninety judicial districts within the United States and the District of Columbia.

SALARIES.—$54,500 annually.

United States Territorial Courts:

NUMBER.—One each in Puerto Rico, Guam, the Virgin Islands, and the Canal Zone.

JURISDICTION.—The same as district courts and, except in Puerto Rico, many local matters.

SALARIES.—$54,500 annually.

United States Court of Claims:

JURISDICTION.—Claims against the United States, including those referred to it by Congress.

MEMBERS.—One chief justice and four associate justices.

SALARIES.—$57,500 annually.

United States Court of Customs and Patent Appeals:

JURISDICTION.—Cases involving appeals from customs duties and from the patent office.

MEMBERS.—One chief justice; four associate justices.

SALARIES.—$57,500 annually.

United States Customs Court:

JURISDICTION.—Civil actions arising under the tariff laws.

MEMBERS. One chief justice; eight associate justices.

SALARIES.—$54,500 annually.

United States Tax Court:

JURISDICTION.—Tax-related cases and judgments on retirement plans.

MEMBERS.—Sixteen justices who elect a chief judge.

SALARIES.—$54,500 annually.

CONGRESS

All legislative power granted by the Constitution is intrusted to the "Congress of the United States," which consists of a Senate and a House of Representatives.

The Senate. To the Senate is given the power of ratifying nominations of the president to public office. The Constitution specifically mentions judges of the Supreme Court and "ambassadors, other public ministers and consuls" for appointment "with the advice and consent of the Senate." The Senate, however, is never formally consulted. It has no right of nomination, but it does at times reject the president's appointments, though rarely in the case of heads of executive departments or "cabinet positions."

Foreign treaties are made "by and with the consent of the Senate, provided two-thirds of the Senators present concur." These two special powers associate the Senate with the president in the determining of foreign policy and in the guidance of foreign relations. Yet this responsibility for foreign policy has been sparingly and rather negatively exercised by the Senate.

The president is considered to have the sole right of negotiating with representatives of other nations and the Senate has never received either foreign delegates or communications. The president does not formally consult the Senate upon foreign relations, though he generally seeks to maintain touch with Senate opinion through its committee on foreign affairs. The president retains complete control of a treaty until he delivers it to the Senate, and he may even then withdraw it. He is not bound to disclose to the Senate correspondence with foreign states, or even to give information within his possession. For these reasons the president, rather than the Senate, generally determines foreign policy, though subject to the severe limitation of having his treaties rejected. The president also has repeatedly conducted foreign negotiations through "personal representatives," unconfirmed by the Senate, or he may himself negotiate personally and directly, as did President Wilson at Paris.

It may also be noticed that, through the treaty ratifying power, the Senate, with the president, may end war and conclude peace, though only Congress can declare war. For the trial of impeachments, the Senate sits as a judicial body, a concurrence of two-thirds of the members present being necessary for conviction. (Article I, sec. 3, par. 6). The chief justice presides at the impeachment trial of a president.

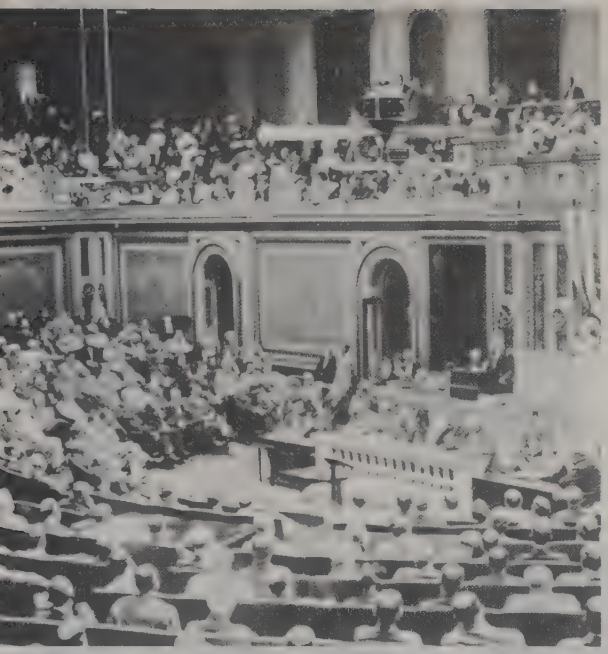
The vice president of the United States is the constitutional presiding officer of the Senate, but a president *pro tempore* is chosen from among the senators. In presidential elections, if no person receives a majority of votes of the electors, the vice-president is chosen by the Senate. The salary of all senators is $57,500 per year.

The House of Representatives. The House of Representatives, likewise, has special powers. It alone can vote impeachment and prosecute the trial of an impeached officer. It alone can initiate bills for raising revenue, though such measures are frequently totally altered by the Senate. In case of a failure of a presidential election to give a majority of electors for one person, the House of Representatives is empowered to select the president by ballot, each state casting one ballot. The salary of members of the House of Representatives is $57,500 per year; the Speaker of the House receives $75,000.

Powers of Congress. Other than as above stated, the two houses possess equality in legislation. The Constitution limits this legislative faculty, however, to expressly defined fields.

To provide for the raising and disbursement of revenue.
To borrow money; to coin money and to regulate its value; and to fix the standard of weights and measures.
To regulate foreign and interstate commerce.
To declare war, and to maintain an army and a navy.

Some Presidential Addresses to Joint Sessions in Recent History



FIRST SINCE ADAMS. President Wilson, shown before Congress in 1914, became first President since 1800 to deliver his messages to Congress in person.

TWENTIETH AMENDMENT. President Roosevelt addresses the 73d Congress on January 3, 1934. This was the first Congress to meet under the terms of the Twentieth Amendment which set the opening day of each session of Congress on January 3 of each year and the date of Presidential inaugurations on January 20 of every fourth year.

STATE OF THE UNION. President Truman gives his state of the Union Message to a Joint Session of Congress on January 5, 1949. Senator Kenneth McKellar (left), President Pro Tem of the Senate and House Speaker Sam Rayburn are seated behind the President.

HERBERT HOOVER TAKES OFFICE. Statesman and humanitarian is sworn into Presidency, March 4, 1929, not to be followed by a Republican until 1953.

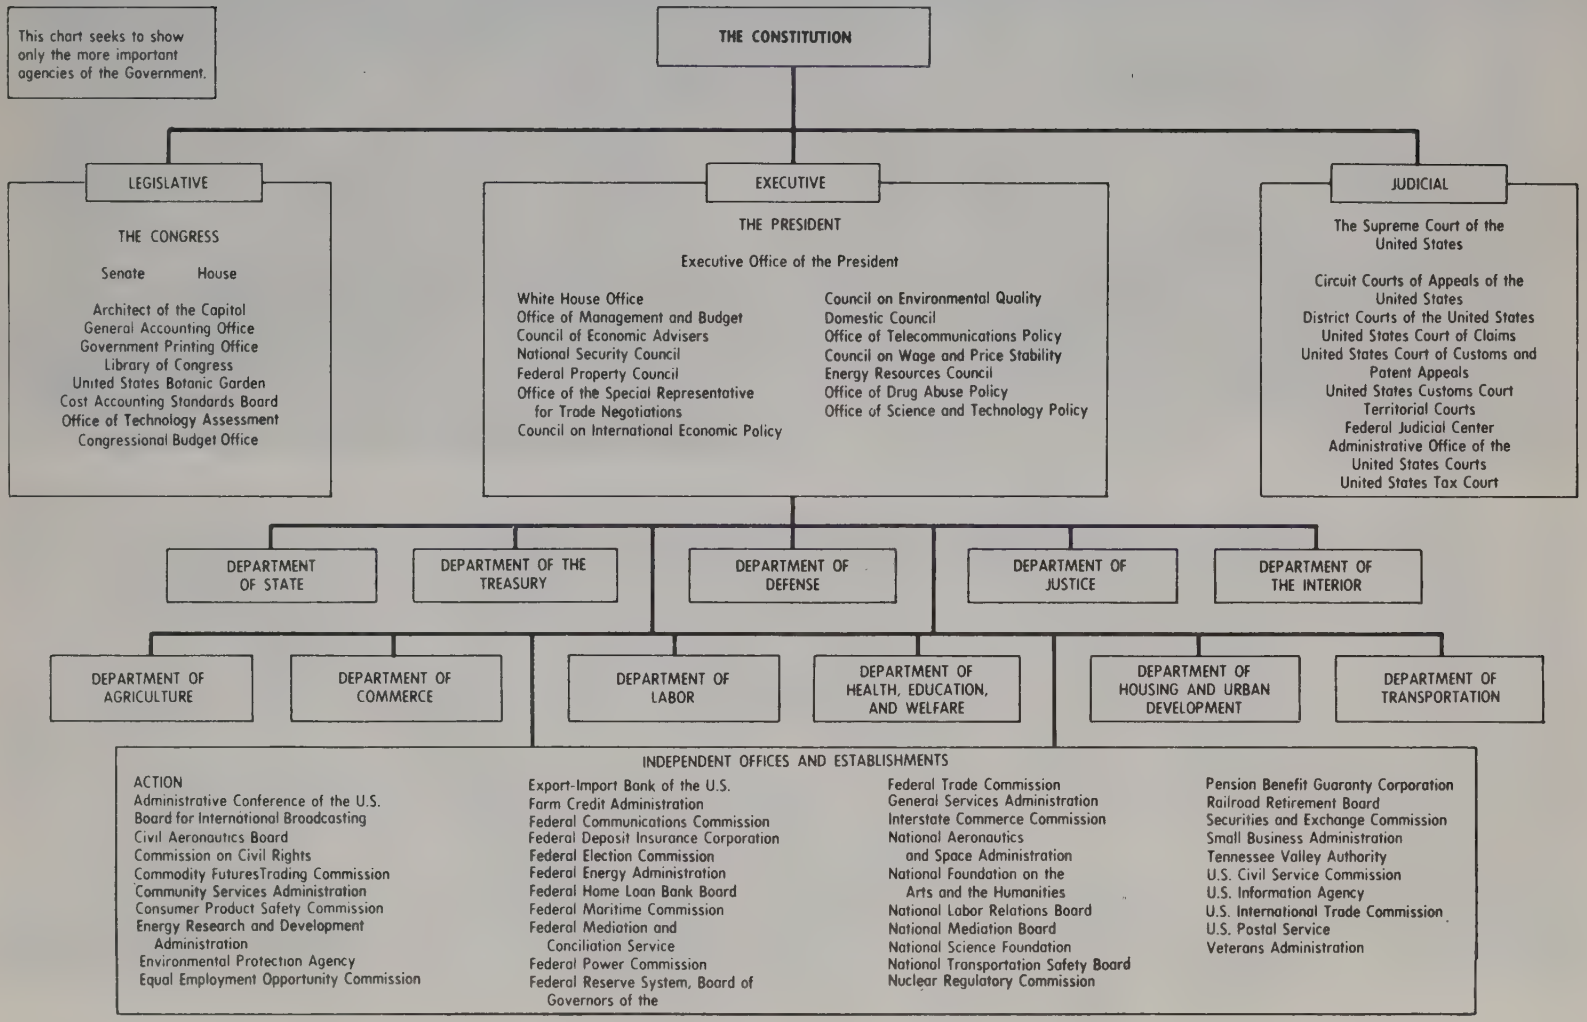
WHITE HOUSE CHANGES HANDS. President Herbert Hoover and President-elect Franklin Delano Roosevelt on drive to inaugural, March 4, 1933.

AGE OF ACTION BEGINS. Newly sworn President Roosevelt lifts heart of Nation with first inaugural speech (1933) that attacked deep national despondency.

THREE GREAT AMERICANS. President Roosevelt, Speaker Rayburn, Senate Leader Barkley drive to Capitol (1941) for FDR's third inauguration.

FOURTH TERM INAUGURAL. Address delivered from South Portico of the White House (January 20, 1945). War strain shows in President Roosevelt's face.

THE GOVERNMENT OF THE UNITED STATES



To establish post offices and post roads.
To enact patent and copyright laws.
To enact uniform naturalization and bankruptcy laws.
To provide for the punishment of crimes against the U.S.
To establish courts inferior to the supreme court.
To provide for organizing and calling out the militia.
To admit new states into the Union.
To provide for the government of the territories.
To exercise exclusive jurisdiction over the District of Columbia, public lands and buildings, forts and navy yards.
To enact all laws necessary and proper for carrying into execution all the powers vested by the Constitution in the government of the United States.

Thomas P. O'Neill	Mass.	1912	....	95–	1977–

Interpreted Powers. The practice of legislation has grown and taken on new aspects through the felt necessity of extending the scope of the national government. The supreme court has usually given a liberal interpretation to these powers, especially to the power to regulate interstate commerce and to enact needed laws to carry into execution the powers vested by the constitution in the national government. The court having decided, however, that the Constitution did not give the power to levy a direct tax on incomes, the 16th amendment was adopted in 1913, giving Congress this right.

Limitations on Powers of Congress. The Constitution limits Congress to powers expressly conferred. It also forbids Congress to:

Suspend the writ of habeas corpus unless, in case of rebellion or invasion, the public safety so requires.
Pass any bill of attainder or ex post facto law.
Lay any direct per capita tax, other than an income tax, without apportionment among the states according to population.
Lay any tax or duty on articles exported from any state.
Give any preference to the ports of one state over those of another.
Grant any title of nobility.
Create a new state within the jurisdiction of another state or out of its territory, without the consent of the state.
Make any law respecting the establishment of religion or prohibiting its free exercise.
Abridge the freedom of speech or of the press.
Forbid the right of peaceable assembly.
Forbid the right of petition.
Pass any law for the quartering of soldiers in private houses, without the consent of the owners, in time of peace.
Pass any law providing for unreasonable searches and seizures, or for the issue of warrants without the usual judicial process.
Infringe the right to keep and bear arms.
Pass any law providing for the holding of a person for a capital or otherwise infamous crime, unless on presentment and indictment of a grand jury, except in cases arising in the land or naval forces or in the militia when in actual service in time of war or public danger.
Pass any law that would subject a person to being twice put in jeopardy of life or limb or deprive him of life, liberty, or property, without due process of law.
Pass any law taking private property for public use without just compensation.
Pass any law denying or abridging the right of citizens of the United States to vote, by reason of race, color, sex, or previous condition of servitude.
Assume or pay any debt or obligation incurred in aid of rebellion or insurrection against the United States, or to pay any claim for the loss of slaves.
Pass any law denying the rights of an accused person to a speedy and public trial by a jury of the locality where the crime is committed, to be informed of the nature and cause of the accusation against him, to be confronted with the witnesses against him, and to compel witnesses to testify in his favor, and to have the assistance of a counsel.
Pass any law forbidding jury trial for suits at common law, where the value in controversy exceeds twenty dollars.
Pass any law requiring excessive bail or imposing excessive fines or cruel and unusual punishments.

These prohibitions apply to the power of Congress in legislating for the Union. It will be noted that they refer explicitly to Congress, not to the states. However, the 14th amendment does place certain restrictions on the states. See *State Rights*.

Enactment of a Law. The process of making laws is long and complex. An understanding of the essential steps in it, however, is necessary for an intelligent grasp of newspaper accounts of the progress of legislation.

Of the numerous steps which a measure may have to pass through before becoming a law, the 16 listed below are the most important. For the sake of simplicity, it will be assumed that the typical bill here traced through Congress originates in the House of Representatives, although all bills except those relating to appropriations may originate also in the Senate. If the Senate acts first on a measure, the rôles of the houses as described here will be reversed. Here are the principal steps:

1. A bill is introduced by an individual Congressman. This step may be preceded by a message from the president recommending action. The message is ordinarily referred to a committee, the chairman of which introduces a bill embodying the proposals. (See *Congressional Committees*.)

2. The bill is referred for study to a standing committee of the House, designated by the speaker.

3. The committee, if it so decides, may take testimony regarding the measure from spokesmen for interested groups, these hearings usually including executive officers of the government.

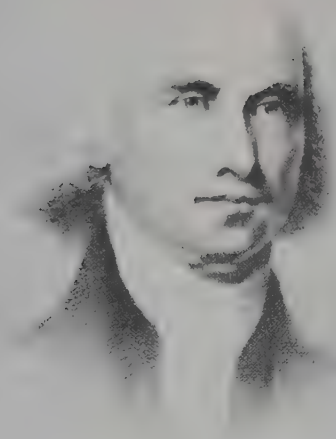
4. The committee may then report the bill back to the House, with or without amendments and with or without recommendation for enactment. If the committee takes no action, the bill is said to die in committee. The House may, however, discharge the committee from further consideration of the bill and so place the bill on the legislative calendar.

5. If passed, the bill is sent to the Senate.

6. There it is referred to a committee, as in the House.

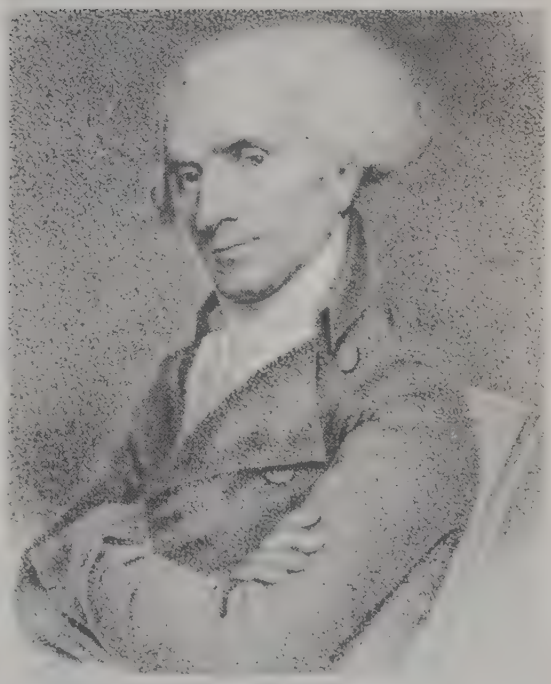
7. The Senate committee may, at its discretion,

Inside the House



JAMES MADISON. In 1789, during the first of his four terms in the House, Madison introduced legislation which subsequently became the Bill of Rights of our Constitution. His rise to the Presidency in 1809 made him the first of sixteen Presidents in U.S. history who have served in the House of Representatives.

JOHN RANDOLPH. Sometimes reckless, often audacious, usually sarcastic, and always flamboyant, this fiery orator served 14 colorful terms in the House of Representatives and 2 years as a Senator. He was an early chairman of the Ways and Means Committee.



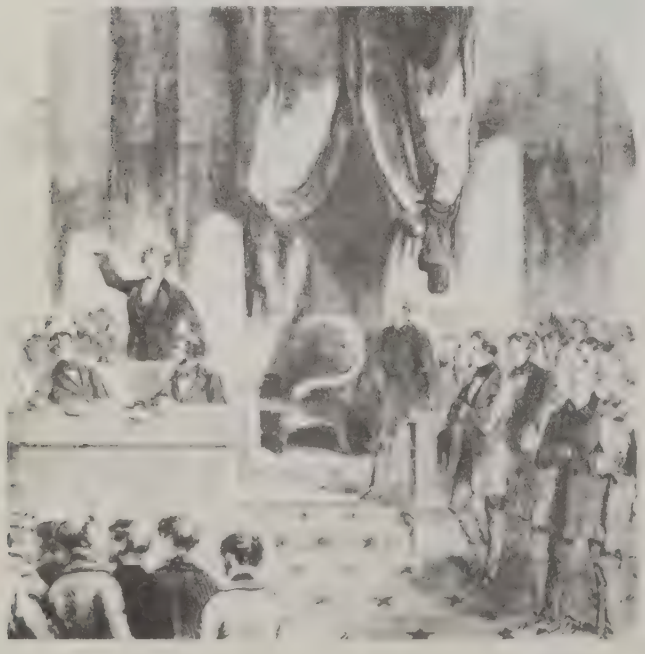
ELBRIDGE GERRY. Member of Continental Congress, signer of Declaration of Independence, and Delegate to the Constitutional Convention, Gerry is representative of the early patriots who rendered distinguished service in the House.

A Historical Sampling of the Men and Events That Have Made It Great

SAM HOUSTON. He served two terms as a Member from Tennessee before going to Texas to win enduring fame.

JOHN QUINCY ADAMS. Two years after his Presidency, Adams was elected to the House, where he rendered 17 years of the most distinguished service of his career. Articulate, industrious, and honorable, he was dubbed "Old Man Eloquent" by his colleagues. In 1848 he was stricken on the floor of the House and died.

BATTLE FOR SPEAKER. The majority party's candidate usually wins the Speakership election, but occasionally a serious contest develops. This sketch depicts a two month battle in the Thirty-fourth Congress when Speaker Nathaniel Banks was elected on the 133d vote.



DAVY CROCKETT. This frontier politician served three terms in the House before riding off to Texas. Under this engraved likeness he has written, "I leave this rule for others when I am dead: Be always sure you are right, then go ahead."

report the bill for favorable action, with or without changes, or it may substitute another bill already before it or an entirely new bill on the subject.

8. If the Senate approves the bill as it came from the House, it goes to the president for his signature. If defeated in the Senate, the bill is dead, barring a reconsideration. The third possible action is approval in amended form.

9. In this last case, the bill goes back to the House, which may accept the amendments, thus making it ready for the president's signature.

10. If the House refuses to accept the Senate amendments or makes others which the Senate refuses to accept, the bill "goes to conference." This means that the measure is submitted to a group consisting of 3 or 5 members of the House and the same number of members of the Senate, each panel appointed by the presiding officer of the house represented. The duty of conferees is to reconcile differences in the bill as approved by the two houses.

11. If no agreement is reached, the bill is said to "die in conference." Otherwise the conferees report their agreement to both houses, and the report is either sent back for further efforts or is accepted.

12. When the conference report is accepted by both houses, the bill goes to the president.

13. The president may sign the bill, usually after consultation with his advisers. It then becomes a law, and is classified by the secretary of state as public or private, and is given a number.

14. The president may fail to sign the bill after he has had it for ten days, exclusive of Sundays. In that case, it becomes law without his signature, except in one circumstance, which is described below under *Pocket Veto.*

15. The president may return the bill to Congress with a veto.

16. Congress may then repass the bill by two-thirds majorities in both houses. If this is done, the bill becomes law without the president's signature. If either house fails to override the veto by this majority, the bill is dead.

Pocket Veto. This term is popularly applied when the president withholds for ten days his approval of a bill and Congress adjourns before the end of the ten days. Under these circumstances, the bill dies without having been specifically vetoed.

Congressional Committees. These bodies form bottle-necks, as it were, by which the vast majority of bills are kept from consideration by Congress, only those regarded as the most important being allowed to pass through. It is by these committees also that the only genuine study in Congress is made of the need and probable effect of the prospective laws.

Representation of the political parties on committees is in approximate proportion to their strength in Congress. The chairman of each committee is always a member of the majority party. It is for this reason that few laws are ever enacted which have not the support of the party in power.

The most powerful committees include the appropriations committee, which handles measures for spending money, and the ways and means committee, which deals with tax bills. Measures from these committees have the right of way at all times. The power to give preferential places on the calendar to other bills rests with the committee on rules. The so-called steering committee is made up of leaders of the majority party only. Its purpose is to hasten legislation favored by the party in power.

Kinds of Congressional Action. Bills are measures which, on approval, become acts. Resolutions represent Congressional action of a "nonlegislative" character. Senate resolutions and House resolutions require action by one house only. Concurrent resolutions require approval by both houses but not by the president. Joint, or public, resolutions require the same procedure as bills. They are frequently indistinguishable from bills except in form and name.

General Accounting Office. The GAO is an independent non-political agency within the legislative branch. Created in 1921, the GAO assists Congress in its legislative responsibilities, audits the federal government, and makes recommendations for more efficient government.

Library of Congress. Established in 1800, it is the foremost library of the U.S. and functions as a research service for the federal government.

THE PRESIDENT

The president of the United States is the highest representative of the nation. Elected by the voters of all the states for a fixed term of years, he is largely independent of Congress, the courts, and sectional demands. In spite of the theory of separation of powers, in accordance with which the constitution-makers created the office, the president has immense influence over legislation and is generally held responsible for the work of Congress.

The president's influence springs from his power of veto; from his constitutional practice of submitting recommendations to Congress; and from his influence as the molder of public opinion. His power of appointment, with his ability to distribute "patronage" among members of Congress, serves to keep the members who are of his party in accord with his policies.

The National Leader. While dependent on his party for nomination and support, he is the recognized national leader of his party and frequently dominates its views and controls its organization. He is, moreover, the head of the entire national administration. Members of Congress, the president, and the vice president are the only elected officers of the U. S. All others are appointed by the president or by heads of departments under his control. The president's removal power extends to nearly all offices, except the judicial or quasi judicial.

Powers. The president is the commander in chief of the armed services, with the right to determine their employment and to dispatch armed forces upon foreign missions. While Congress alone can legally declare war, the president has repeatedly, of his own authority, used the armed services for military action and for territorial incursion. After the Vietnam war, however, the Wars Power Act was passed by Congress, thus limiting the president's military powers somewhat. On his will and judgment, more even than on the attitude of Congress, seems to rest the momentous decision of peace and of war. By his direction the attorney general undertakes judicial investigations and prosecutions. These may be suspended or abandoned by the president's direction. He may grant pardon to persons convicted for offenses against the U. S. or those under investigation for past offenses, and amnesty to political prisoners or to those in rebellion. He may commute or suspend sentences after conviction or during the trial. He may fill a vacancy in the vice presidency subject to Congressional ratifications.

Cabinet. The cabinet meets solely to advise with the president and may not with propriety assemble without his presence. Its views are purely consultative and in no manner bind his freedom of decision. He may at any time direct the action of the head of a department, and in the field of foreign relations frequently does so, and may alter or reverse a department's decision.

Disability. The president remains in office, irrespective of the attitude of Congress or of the support of the nation, until the end of his term, or until his death in office. In case of his disability, the vice president serves as acting president. Rules for determination of disability and its termination are set forth in the 25th amendment.

Place of Power. The official actions of the president need not be taken at the national capital. He may exercise any power at any place within the country or while abroad.

Jimmy Carter—39th President of the United States. Former Georgia Governor Jimmy Carter became President on January 20, 1977. In a close election, Carter defeated Gerald R. Ford, the Republican candidate. Walter F. Mondale, Carter's running mate, became the 42nd U.S. Vice President.

Impeachment. Impeachment is the only way of removing a capable president from office. Impeachment charges are brought by the House of Representatives and are tried by the Senate. A two-thirds vote of the Senate is necessary for conviction. There have been two impeachment proceedings initiated by Congress against presidents. The first, against Andrew Johnson in 1868, failed by one vote in the Senate. The second, against Richard Nixon in 1974, ended after he resigned.

The President and Judiciary. Prior to the Watergate scandal of 1972–74, it was believed that federal courts could not issue writs against the president nor could his actions be judicially reviewed. However, Chief Justice Warren Burger in a Supreme Court decision handed down on July 24, 1974, declared: "Neither the doctrine of separation of powers, nor the need for confidentiality of high-level communications, without more, can sustain an absolute unqualified presidential privilege of immunity from judicial process under all circumstances." Although the Supreme Court's decision was unprecedented, wide-ranging conclusions could not be drawn from it because of the special circumstances surrounding the decision.

Authority in Crises. During war time, the president becomes virtually a national dictator, concentrating in his office the strength and the will of the nation. However, while Congress and the nation have given unreserved support and authority to the president during war, they have limited him in the arrangement of peace.

Magnitude of Power. Reviewing the office of president in the light of other national executives, it is probably correct to say that it exceeds most other modern offices in the breadth of its powers and in the respect which it commands. Since the term of Washington, it has steadily grown in independence and in influence. Although the power of the presidency has increased over the years, it might be noted that any attempts to make the office all-powerful and encompassing have been checked by the legislative and judicial branches.

THE EXECUTIVE DEPARTMENTS

These are 11 in number, all established by acts of Congress. The department heads constitute the president's cabinet. The departments with dates of establishment are: State (1789), Treasury (1789), Interior (1849), Justice (1870), Agriculture (1889), Commerce (1903), Labor (1913), Defense (1947), Health, Education and Welfare (1953), Housing and Urban Development (1966), Transportation (1966). Except for the attorney general, heads are called "secretary."

Heads of Departments. The departments have from one to several assistant secretaries and a chief clerk. They are divided into bureaus and divisions, each with a single head known as "director" or "commissioner," "chief," etc. Subject always to his subordination to the president, who appoints and may at any time remove him, and who is politically responsible for his official acts, a department head directs the entire service under him; appoints and removes subordinate officials; issues "regulations" governing the administrative work; and decides disputes or controversies arising from the actions of his subordinates.

In many cases the decision of the department head is final, though in others there is appeal to the president. The list of bureaus and of other divisions as fixed by statute is given in a tabulated form below, together with the list of department heads and the years of their service. There is no department corresponding to the ministry of dependencies in other governments. The Department of the Interior supervises the Virgin Islands, Guam, and Samoa. The Canal Zone is under army direction.

DEPARTMENT OF STATE

The secretary of state, in event of the death of the president, is fourth in the line of presidential succession. Thus far, no secretary of state has been called to fill this place. All treaties are negotiated by the secretary of state, who often conducts the discussions in person, through interviews with foreign representatives. The secretary, under the direction of the president, is charged with the duties of correspondence with ministers and consuls of the United States, and with representatives of foreign powers accredited to the United States. He is charged also with negotiations of whatever character relating to foreign affairs.

He and his staff represent the U.S. in over 50 international organizations (such as the United Nations and the Organization of American States) and at various international conferences. His primary functions are to execute current U.S. foreign policy and to make recommendations on future action. As the most important cabinet officer, the secretary is a member of the National Security Council. He is also custodian of the treaties made with foreign states, and of the laws of the U.S. The modern Department of State has been relieved of virtually all domestic duties.

DEPARTMENT OF DEFENSE

The National Military Establishment was created July 26, 1947, to unify the armed forces. Formerly, military control had been divided between the War Department, created in 1789, and the Department of the Navy, created in 1798. These two were merged to become the Department of Defense, headed by the secretary of defense. Subordinate to him in separately organized departments are the secretaries of the army, navy, and air force. The Department of Defense is responsible for providing military forces to deter war and to ensure the security of the country. It provides civilian oversight of the armed forces while working closely with the joint chiefs of staff. Its central headquarters is the Pentagon.

DEPARTMENT OF THE TREASURY

The secretary of the treasury is charged by law with the management of the national finances. He prepares plans for the improvement of the revenues and for the support of the public credit, including the issuing of government bonds and treasury certificates; superintends the collection of customs and the internal revenue, including income taxes and taxes on tobacco and other commodities or articles; directs the forms of keeping and rendering public accounts and of making returns; grants warrants for all moneys drawn from the treasury. This department also handles the planning, construction, and maintenance of public buildings. It coins metallic money and engraves and prints the paper currency. An annual estimate of revenues and expenses of the government is prepared by the treasury department for presentation to Congress by the president.

DEPARTMENT OF JUSTICE

The attorney general is head of the Department of Justice and chief law officer of the government. He directs and controls a large force of attorneys and marshals, not only in the office at Washington, but also in the 85 judicial districts into which the United States and the territories are divided. He furnishes opinions and interpretations of the laws for the guidance of the president and the heads of executive departments. In the performance of this last duty he may approve and adopt the opinions of his subordinates except upon questions involving the construction of the Constitution, but upon such questions he must give his own opinion. Immigration and naturalization laws, federal prisons and paroles, are administered by this department. The department of justice conducts a bureau of narcotics and dangerous drugs; also a bureau of investigation (F.B.I.) (est. 1908) to secure evidence against crimes that violate federal laws and to assist states and localities in law enforcement.

DEPARTMENT OF THE INTERIOR

The secretary supervises public business relating to domestic welfare; oversees surveying and mapping of the country; improvement of national parks; land reclamation; construction of large dams and disposal of their power. The department has supervision of Indian affairs: educational, hygienic, and relief activities on reservations; also with supervising insular affairs, fisheries, and biological surveys. It controls appropriations for agricultural colleges and mechanical institutions in the states and territories, and for certain hospitals and charitable institutions in the District of Columbia. The secretary supervises conservation of oil resources and collects information on minerals and mining.

DEPARTMENT OF AGRICULTURE

The secretary directs all public business relating to agricultural industry. He administers laws on marketing, subsidizing, and insurance of crops, also on land use and surpluses. The department engages in research and information services. It works to control plant and animal diseases and to improve crops and livestock. It provides weather reports, crop reports and estimates, and forest services and grants credits to farmers on crops, farms, and cooperatively constructed rural electrification projects.

DEPARTMENT OF COMMERCE

The secretary of commerce is charged with the promotion of the commerce of the U.S. and with its manufacturing, shipping, fishing, and transportation interests. He investigates the organization and management of corporations engaged in interstate commerce (except railroads), and enforces laws to protect life and property on the water. The department also supervises the National Bureau of Standards, Patent Office, Coast and Geodetic Survey, Weather Bureau, and Bureau of the Census. The divisions gather and distribute information and encourage standardization in manufacture. The department has charge of setting rates and making regulations of the Civil Aeronautics Board (CAB). Since 1966, the safety functions of the CAB have been delegated to the Department of Transportation.

* Prior to 1913, Secretaries of Commerce and Labor.

DEPARTMENT OF LABOR

The secretary of labor is charged with fostering, promoting, and developing the welfare of wage earners, improving working conditions, and advancing opportunities for employment. He administrates and assists in the enforcement of the Fair Labor Standards Act. He takes the initiative in seeking cooperation with state legislatures for protecting labor's welfare. He also gathers and publishes data on labor conditions abroad. He makes available information on the cost of living and the extent of employment and pay rolls in industry and trade. The department is charged also with conduct of the national employment offices.

DEPARTMENT OF HEALTH, EDUCATION AND WELFARE

The secretary of this department supervises the extension work of the Public Health Service in the field of medical research and in the maintenance of hospitals. Through the Office of Education, information is collected on all matters pertaining to education, and funds are allotted which are made available by Congress in federal aid to education. The department also has oversight of the Social Security Administration.

Government

In 1970 the Post Office Department was made a government-owned, independently operated, self-supporting corporation within the executive branch, ending Congressional authority over the system. The U.S. Postal Service, as it is now called, has an 11-man board of governors; 9 are appointed by the president with approval of the Senate. Those 9 select a 10th, who becomes postmaster general; those 10 select the 11th, who is deputy postmaster general. The postmaster general is no longer a cabinet-level position.

THE EXECUTIVE OFFICE OF THE PRESIDENT

By the authority of the Reorganization Act of 1939, various agencies were placed in the office of the president. Since then other agencies have been established within the office by legislation, executive order, and reorganization plans. These councils play a close advisory role to the president on policy decisions and have grown in importance. Some of the most significant are listed and described below.

The Office of Management and Budget (OMB), formerly the Bureau of the Budget, was established by a reorganization plan of 1970. Headed by a presidential appointee, it helps to manage, prepare, and supervise the federal budget and performs management duties that cross depa tmental lines. It is the president's vehicle for making the government more efficient and economical.

The Council of Economic Advisors was established in the executive office by the Employment Act of 1946 and consists of three members appointed by the president with the advice and consent of the Senate. Its primary functions are to analyze the national economy and world economic developments and to advise the president on economic policy.

The National Security Council was established by the National Security Act of 1947, the act which also created the Central Intelligence Agency. An executive director, appointed by the president as his assistant for national security affairs, presides over the council which consists of the president, the vice president, and the secretaries of state and defense. The council integrates domestic, foreign, and military policies relating to the national security.

The Central Intelligence Agency (CIA) functions by an executive order of 1976 and is overseen by the National Security Council and other presidential advisory boards. Its purpose is to collect foreign intelligence and to coordinate and evaluate the foreign intelligence activities of the federal government. It has no internal security functions. The director of the CIA is appointed by the president with the advice and consent of the Senate.

The Domestic Council was established by a reorganization plan of 1970. It consists of presidential assistants, cabinet members, and agency heads whose primary interest is in domestic affairs. The council coordinates domestic policy, makes policy recommendations to the president, and reviews established domestic programs.

The Energy Resources Council was created by an executive order of 1974. It consists of an executive director, cabinet members, and various agency heads whose concerns include energy. Its main function is to develop an overall energy policy for the president. It is also charged with coordinating energy policy matters in the various agencies concerned with energy in the federal government.

The Council on Environmental Quality was established by the National Environmental Policy Act of 1969. It consists of three members appointed by the president with the advice and consent of Congress. The council develops and recommends to the president policies which could further environmental quality. It reviews and analyzes government programs affecting the environment and is the administrator of the environmental impact statement process.

The Council on Wage and Price Stability was established by an act of 1974 as amended by an act of 1975. It consists of an assistant to the president for economic policy; the secretaries of agriculture, commerce, labor, and the treasury; and the director of the OMB. Its main function is to monitor the economy with respect to such key indicators as wages, costs, productivity, profits, and prices. It also reviews federal programs to find which are inflationary.

FEDERAL AGENCIES AND COMMISSIONS

Outside of the executive departments, a large number of functions of the government are entrusted to boards, agencies, and commissions. Created by Congress and operating in conjunction with the executive branch, these bodies nevertheless have a large measure of freedom in performing tasks assigned to them.

In addition to the work of the major commissions, federal affairs are carried on by numerous bodies known variously as administrations, agencies, authorities, boards, bureaus, committees, corporations, councils, offices, and systems. Some are chiefly advisory, but all have far-reaching powers within the controls exercised by the legislative and executive branches to which they are responsible.

From time to time, Congress has granted presidents the power to reorganize, combine, or abolish various executive agencies—such actions being final unless reversed by Congress within a limited period.

Some of the most important agencies include those below. Additional agencies are treated in other parts of this volume as shown in the index. They include: the Federal Deposit Insurance Corporation, Federal Reserve Board, National Labor Relations Board, National Mediation Board, and the Securities Exchange Commission. See the index also for the Tennessee Valley Authority.

Action was created by a reorganization plan of 1971. Its authority is provided by the Peace Corps Act of 1961 and the Domestic Volunteer Service Act of 1973. Action provides centralized coordination and administration of domestic and international volunteer activities sponsored by the federal government. Some of the organizations under the jurisdiction of Action are: The Peace Corps, volunteers who work overseas; VISTA (Volunteers in Service to America), volunteers who work in the U.S.; and RSVP (Retired Senior Volunteer Program), citizens of 60 years or older working in their own communities.

The Civil Service Commission was created by a special act of 1883 as the central personnel agency of the executive branch. Its main purpose is to recruit, examine, train and promote employees on the basis of ability, regardless of their race, religion, sex, political influence, or any other nonmerit factors. The Commission also ensures that the government provides various services to employees.

The Consumer Product Safety Commission was established by an act of 1972. The CPSC protects the public against unreasonable risks of injury from consumer products, evaluates the comparable safety of products, develops uniform safety standards for products, works to minimize conflicting state and local regulations, and researches and investigates the cause of and works for prevention of product-related deaths, illnesses, and injuries. The CPSC also conducts educational programs and has the authority to ban hazardous products.

The Energy Research and Development Administration was established by the Energy Reorganization Act of 1974 and was activated in 1975 by an executive order. ERDA was created to reorganize and consolidate federal activities relating to research and development of the various sources of energy. Its overall purpose is to increase the productivity of the national economy and strengthen its international trade position by demonstrating the commercial feasibility and practical applications of the extraction, transmission, and utilization of energy from various sources.

The Environmental Protection Agency was established in the executive branch as an independent agency by Reorganization Plan No. 3 of 1970. Its mandate is to mount a coordinated attack on environmental pollution in cooperation with state and local governments. The EPA has authority to control and reduce pollution in areas of air, water, solid waste, pesticides, noise, and radiation.

The Federal Communications Commission was created under an act approved June 19, 1934. Its duty is to supervise, and guard the public interest in, interstate communications, including: radio, television, cable TV, telegraph, and telephone. It was given additional authority in 1962 to regulate communications satellites. The FCC licenses broadcasting stations, assigns wavelengths, and issues rules regarding the fairness doctrine, political broadcasting, and fair competition.

The Federal Power Commission was created by the Federal Water Act of 1920, originally to license hydroelectric developments on navigable streams. Its authority was later enlarged to include regulation of interstate transmission of electricity, sale and purchase of properties by utility companies engaged in interstate commerce, interstate aspects of natural gas industries, and the construction of interstate pipeline facilities. Its principal concern is that consumers have adequate supplies of gas and electricity at reasonable rates.

The Federal Trade Commission was created by an act of Sept. 26, 1914, and organized as an independent administrative agency in 1951. It supervises and regulates corporations or persons engaged in interstate commerce other than those under the jurisdiction of the Interstate Commerce Commission. The foundation underlying all its duties is to prevent the free enterprise system from being stifled by monopolies or restraints on trade, or corrupted by deceptive trade practices. Among its principal functions are: to prevent corporate mergers that would lessen competition, to enforce the Fair Packaging and Labeling Act and the Truth in Lending Act, and to make available information to interested parties.

The General Services Administration was established by the Federal Property and Administrative Services Act of 1949. It manages all the government's properties and records, supervises the construction and operation of buildings, and distributes supplies. Among the bureaus that are under the GSA are the Automated Data and Telecommunications Service, the Federal Preparedness Service, and the National Archives and Records Service.

The Interstate Commerce Commission was created by the Interstate Commerce Act of 1887. Its powers were broadened by later legislation such as the Elkins Act of 1903, the Hepburn Act of 1906, the Mann-Elkins Act of 1910, the Panama Canal Act, the Motor Carrier Act of 1935, and the Transportation Acts of 1920, 1940, and 1958.

The ICC has the power to regulate interstate surface transportation, including trains, trucks, buses, inland waterway and coastal shipping, freight forwarders, oil pipelines, and express companies. Its mandate is to ensure that the public obtains the full measure of all transportation services to which it is entitled with rates that are fair and reasonable.

The National Foundation on the Arts and the Humanities was created by an act of 1965. The Foundation consists of the National Endowment for the Arts, the National Endowment for the Humanities, and the Federal Council on the Arts and the Humanities. The Federal Council consists of 14 members including the two endowment chairmen and coordinates the activities of the two endowments and related programs of other federal agencies.

The Nuclear Regulatory Commission was established by the Energy Reorganization Act of 1974. All of the licensing and related regulatory functions previously assigned to the Atomic Energy Commission were transferred to the NRC. The commission makes rules and sets standards for the licensing of persons and companies to build and operate nuclear reactors and to own and use nuclear materials. The commission also inspects the activities of persons and companies licensed to ensure that the safety rules of the commission are not violated.

Smithsonian Institution. This institution "for the increase and diffusion of knowledge," was created by act of Congress in 1846 in accordance with the will of James Smithson, of England, who in 1826 bequeathed his property to the United States government for the purpose. It is governed by a Board of Regents consisting of the Chief Justice of the Supreme Court, the Vice-President of the U. S., three Congressmen, three Senators, and six private citizens. The executive head is the Secretary of the Smithsonian Institution. It carries on its functions by means of sponsoring scientific research and exploration, the publication of books and periodicals, and the collection and exhibition of objects of scientific, historical, and artistic interest.

The original building, the "Old Smithsonian," was completed at Washington, D. C., in 1855 under the direction of the first Secretary, Joseph Henry.

The United States International Trade Commission was established by the Trade Act of 1974. It formerly was the United States Tariff Commission, created by an act of Sept. 8, 1916. Its main purpose is to furnish studies, reports, and recommendations involving international trade and tariffs to the President, the Congress, and other government agencies. The Trade Commission was given broad powers of investigation relating to: customs laws of the U. S. and foreign countries, the volume of importation in connection with domestic consumption and production, conditions relating to competition of foreign industries with U. S. industries, and all other factors affecting competition between articles manufactured in the U. S. and imported ones.

Veterans Administration. This establishment represents a consolidation of all government agencies affecting war veterans. Formed under authority of an act passed in 1930, it supervises the payment of pensions and disability allowances to veterans and their relatives, administers war risk insurance, the hospitalization, medical care, and vocational rehabilitation of veterans, and has charge of the payment of adjusted compensation certificates.

THE FEDERAL JUDICIARY

The Constitution (Art. III) provides that the judicial power of the U. S. shall be vested in one Supreme Court and inferior courts established by Congress and that all Federal judges shall hold office during good behavior, with compensation that may not be diminished during their term of office.

Organization. Congress in 1789 passed a judiciary act providing for the organization of the Supreme Court, with a chief justice and five associate justices. Later laws were revised and codified in the act of March 3, 1911. Since 1863 the court has consisted of a chief justice and eight associate justices. The annual salary of the chief justice is $75,000 and of the associate justices, $72,000.

Two attempts, one in 1802 and the other in 1866, made by Congress to reduce the size of the court by enacting that the next vacancy occurring should not be filled, were repealed before the vacancies occurred.

District courts of the United States increased from 13, in 1789, to 89 in the 50 states by 1976. In addition, there is one in Washington, D. C., and one in Puerto Rico. All district courts are entirely within the boundaries of single states, with some states having as many as four districts. Each district court has from 1 to 27 district judgeships; and in districts where there are more than one, the judge senior in commission who has not reached his 70th birthday acts as chief judge. Usually one judge hears a case, but in some circumstances three judges may sit. The judges hold office provided by Article III, Section 1 of the Constitution.

Since their first organization the Supreme Court and the district courts have remained practically unchanged. The system of circuit courts, however, has varied at different times. At present it has the form of eleven circuit courts of appeals. Each court is formed of a member of the United States Supreme Court, designated as circuit justice, and several circuit judges, who are frequently appointed from among the United States district judges. No more than three judges usually sit at a single hearing. These courts were created to relieve the Supreme Court from its excessive burden of appealed litigation. They hear most cases of appeals from the district courts, and, except in a narrow range of cases, their decisions are final.

Constitutional Jurisdiction. The Constitution fixes the jurisdiction of the Federal courts and limits it to:

Cases arising under the Constitution.
Cases under Federal laws and treaties.
Cases affecting ambassadors, ministers, and consuls.
Cases in admiralty and maritime jurisdiction.
Cases in which the United States is a party.
Controversies between states; between citizens of different states; or by a state against the citizens of another state.
Cases between U.S. citizens and foreign states, citizens, or subjects.
Cases between citizens of the same state claiming lands under grants of different states.

The Constitution limits the court's appellate power by making it subject to exceptions and regulations determined by Congress. Congress has never attempted to use this power.

In cases affecting ambassadors, public ministers, and consuls, and in cases in which the state is a party, the Supreme Court has "original jurisdiction." Other cases before the Supreme Court come to it on appeal from the district courts, where the evidence is taken. It is thus rare for the Supreme Court to take evidence, its business being interpretation of the law and listening to arguments thereon.

A unique feature of the United States courts is their practice of passing upon the constitutionality of both congressional and state legislation. The Constitution (Art. VI, clause 2) provides: "This Constitution and the laws of the United States which shall be made in pursuance therewith, and all treaties made or which shall be made under the authority of the United States, shall be the supreme law of the land; and the judges in every state shall be bound thereby, anything in the constitution or laws of any state to the contrary notwithstanding."

It follows naturally that the Supreme Court and other Federal courts have been called upon to determine whether certain laws were in harmony or in conflict with the "supreme law of the land." This power was exercised very sparingly in the first 70 years of American history. Up to 1861, only three Federal laws had been invalidated by the court. By 1936, out of some 24,300 laws passed by Congress, 65 were declared unconstitutional. This judicial determination of constitutionality is a feature original with the American tradition.

Critics have contended that some of the court's decisions have encroached on the functions of legislation. The power of enforcing its own interpretation of the Constitution has placed the court in a position to determine, within limits, how wide Federal powers are. Under John Marshall's 34 years as chief justice a broad interpretation was given to Federal powers, provided they were clearly derived from the Constitution. In the present century this tendency was carried further, although with a temporary reversal in 1935-36, when numerous economic laws of the Roosevelt administration were declared invalid. A statute of 1937 provided that one-man Federal courts might not enjoin enforcement of laws on the ground of unconstitutionality and that, when injunctions were issued on this ground, appeal might be taken direct from district

court to Supreme Court. The Supreme Court and other Federal courts limit their pronouncements on state legislation to the question of whether it is in harmony with the Federal Constitution, laws and treaties.

A majority opinion only among the justices of the Supreme Court participating is necessary to a decision. The decision presenting the majority view is prepared and signed by a member of the court designated by the chief justice. A justice holding the majority view, but upon other grounds than those expressed in the opinion of the court, may offer a "concurring decision." A dissenting justice may submit a "dissenting opinion." In voting on a final decision, the youngest judge in point of service votes first, followed by the next youngest, and so on, with the chief justice voting last.

The Court of Customs and Patent Appeals. This court, established in 1909, consists of five judges appointed by the president for life. It reviews decisions of the board of general appraisers on collection of customs duties and decisions of the patent office.

United States Customs Court. The court was established as the Board of United States General Appraisers by an act of 1890 and was made the United States custom court by an act of 1926. The court has exclusive jurisdiction of civil actions involving the tariff laws. It also has the authority to exclude merchandise from entry into the U.S. The court consists of a chief judge and 8 associate judges; not more than 5 of whom can belong to any one political party.

United States Territorial Courts. In accordance with its authority to govern the territories, Congress has established district courts in the territories of Puerto Rico, Guam, the Virgin Islands and the Canal Zone. Except in Puerto Rico, where the court operates in the same way as a U.S. district court, these courts have jurisdiction over many local matters.

United States Tax Court. This court was created originally as the United States Board of Tax Appeals by the Revenue Act of 1924 and was subsequently changed to its present name and status by the Tax Reform Act of 1969. The court has jurisdiction over cases involving underpayments or overpayments in income, estate, gift, and personal holding company surtaxes as determined by the commissioner of internal revenue.

Court of Claims of the United States. The court was established by an act of February 24, 1855, with general jurisdiction over all claims upon the United States government, except pension claims, and, since 1915, except claims growing out of the Civil War. The court consists of seven judges, the concurrence of four being necessary to a decision. Where the court finds for the complainant, judgment is entered against the United States payable out of the public treasury.

JUSTICES OF THE SUPREME COURT*

Name	Term	Yrs.	Born	Died
John Jay, N. Y.	1789–1795	6	1745	1829

STATE CAPITOLS

A traditional American spirit is preserved in the clean lines of Delaware's capitol at Dover.

A. Ken. Pfist

Functional design for practicality and classic lines for beauty distinguish Oregon's capitol at Salem.

Oregon State Highway Department

Towering above the prairie landscape, North Dakota's new state building at Bismarck accentuates the modern skyscraper design.

A wooded background suggesting the "Green Mountain State" frames Vermont's classic capitol at Montpelier.

Vermont Development Commission

Kentucky's capitol at Frankfort is placed far back in a landscaped setting that enhances its beauty.

Dept. of Public Relations, Frankfort, Ky.

Santa Fe, the only state capitol built in the Territorial style, based on Spanish colonial architecture. The tower rises 105 feet.

New Mexico Tourist Bureau

AMERICAN STATE GOVERNMENT

The United States of America is a federal union of fifty commonwealths, or "states." It has been defined as "an indestructible union of indestructible states." Two classes of government are created or recognized by the Constitution: the national or "federal" government; and the state governments. Back of both of these governments is the nation, with its political sovereignty in the entire people.

State government is older than the federal government, which was created by the bestowal upon it of powers previously existent in the states. These powers are definitely prescribed by the federal Constitution. All powers not given to the federal government are reserved to the states. This constitutional arrangement gave to the modern world its first expression of "federalism."

Federal Expansion. The tendency of successful federal government is to augment gradually the scope and the authority of the national government as against the state governments. This tendency is observable in America. The theory that sovereignty still existed in the states and not in the national government was extinguished by the outcome of the Civil War, 1861–65. The existence of complete free trade between the states, as guaranteed by the Constitution, has built up an industrial organization within the United States that recognizes no state boundaries or lines. Transportation and commerce have become largely "interstate." The population moves unhindered from state to state, while domicile with political rights is a matter of automatic transfer of residence. These and other considerations have constantly tended to extend the federal government and to strengthen its control over industry and transportation on a national scale.

Concurrent Powers. The result of this process at times has seemed to menace the original character of the state governments. Nevertheless, while the activity of the national government is more impressive and of much more interest to the average citizen of the United States, the authority of the state government comes closer to his person, to his business, and to his home. The field of administration exercised by the state embraces the establishment and control of local and municipal government, of public instruction (except so far as it is assisted and consequently influenced by federal grants or subventions), and of public health (except where the federal government may exercise authority in the case of national epidemic). It embraces also the care of dependents and defectives; the construction of highways and other communications; private law, including domestic relations, inheritance, rights of property, contracts; the exclusive control of corporate industry (except where it takes on an interstate character); the punishment of criminals; and the protection of public order.

In this last and important field the president may, on request of the governor of a state, apply the power of the national government. In cases where interstate commerce has suffered interference or the movement of the United States mails has been stopped by violent acts, the president has dispatched United States troops and placed localities under military control without application of the governor, and even in the face of his protest. While generally the police powers exercised by the Federal government and by the state governments are distinct fields, they are frequently used in collaboration.

Furthermore, in about 1906 the state governments took on new vigor, which expressed itself in a large variety of social and industrial legislation, in the creation of new administrative agencies, and in movements to reorganize and strengthen state administration.

But during World War I, power shifted once again to the federal government as the states became mere executors of federal policy. Afterwards, even though two-thirds of the states went on record in favor of the League of Nations, the U.S. Senate failed to ratify the treaty. The prosperity of the 1920s further demoralized any attempts to pass progressive legislation in the states. When the Great Depression struck in 1929, even the richer states could not afford to meet the demand. Everyone turned to the federal government and Roosevelt's New Deal to pull the country out of the crisis. Since that time, government in the United States has continued to become much more centralized.

Interstate Compacts. With the permission of Congress states may enter into treaties or compacts for dealing with common problems. Compacts have been authorized by Congress for concerted action on such matters as use of water from a common river, limitation of petroleum production, and regulation of labor standards. They have been found more satisfactory when involving one definite arrangement, as in a boundary agreement, but less so when used as a substitute for unified authority in meeting a complex problem.

STATE CONSTITUTIONS

The written constitutions of the American states are older than the federal Constitution. They are, in fact, an American political invention. They grew out of the colonial charters of the period of English sovereignty. They assumed their typical form during the Revolutionary War, 1775–1783. They still bear the marks of their origin and of the political theory of that day. A century and a half of growth has occasioned an extraordinary number of changes and recastings of these organic acts, without radically altering their general type.

Upon the outbreak of the Revolutionary War in 1775, the Continental Congress, a body formed by representatives of the thirteen American colonies which were united in revolution, recommended to these colonies the adoption of new constitutions, to take the place of the governments which had existed under British royal authority. Certain colonies adopted this suggestion in the following order: New Hampshire, South Carolina, Virginia, New Jersey, Delaware, Pennsylvania, North Carolina, and Maryland. Virginia was the first state to devise a constitution with a complete frame of government and with a code of popular rights.

None of these new constitutions was "popularly ratified." Massachusetts, by its constitution of 1780, inaugurated a further step. An assembly elected for that sole purpose framed the constitution, which was then submitted to the suffrage of the people of the commonwealth. Thereby was initiated the practice of popular ratification of constitutions, now the representative procedure.

Some 144 state constitutions have been prepared and put into execution during the history of American state government. Each of the 50 American states is governed by such an organic act. Louisiana, in the course of its history, has had 11 constitutions, the last effective from 1975.

Admission to Statehood. "Admission to the Union" is an action taken by the Congress under one of its most important constitutional powers. With the exception of the 13 original states, Texas, Vermont, Maine, West Virginia, and California, all of the states, before admission, were territories governed under acts of Congress. The territories were not members of the Union. Their people had no constitutional political rights and did not participate in national elections. "Admission" of a territory to statehood, however, was admission to full equality with all other states. Congress, when it judged the time ripe for the admission of a territory as a new state, by an "enabling act," authorized an election for the purpose of drafting a constitution.

This action, if satisfactory, led to the admission by Congress into the Union. Congress, more than once, by legislation, has prescribed conditions under which a given territory should be admitted to statehood, as, by the suppression of polygamy in the case of Utah. Such limitations, however, imposed by the Federal government, become invalid as soon as the state is admitted to the Union.

Arizona was admitted to statehood in 1912 only after removing from its proposed constitution, at the insistence of the president and the Congress of the United States, a provision for the recall of judges. Immediately after admission into the Union, however, the state of Arizona exercised its right to replace this provision in its constitution. The dates of the original ratifications of the Federal Constitution and of admission of states since the formation of the Union, in 1789, are given in the table entitled *United States, Historical Statistics.*

Amendments to State Constitutions. Three procedures exist for the amendment of a state constitution, two being operative in the great majority of states. These are (1) amendment on proposal of the legislature; (2) amendment by a constitutional convention; and (3) amendment by popular initiative. In addition, Florida's constitution authorizes the use of a constitutional commission to initiate constitutional changes and to submit them directly to the electorate. The oldest and most generally utilized method of amendment is by a proposal of the legislature.

The Legislative Proposal. Differing conditions attend the legislative proposal: (1) that it must be passed by two successive legislatures (in Delaware this procedure enacts the amendment); (2) passage by an extraordinary majority—two-thirds or three-fifths vote of all members elected; (3) limitations as to the number of amendments proposed at one time, or the frequency with which the same amendment can be passed. In all states but Delaware the proposal, having passed the legislature, is submitted to popular ratification.

In most states a majority of votes cast ratifies the amendment and makes it a part of the constitution. Nebraska and Hawaii require a majority of those voting on the measure, provided votes cast in favor are not less than 35 per cent of the total votes cast at the election; New Hampshire requires two-thirds of those voting thereon; and Tennessee requires a majority of citizens voting for governor. A majority of all votes cast at the election is required in 3 states—Illinois, Minnesota, and Wyoming. In amendments concerning certain elective franchise and education matters, New Mexico requires approval by three-fourths of all electors voting in the state and two-thirds voting in each county.

Constitutional Conventions. Constitutional conventions or extraordinary legislative bodies, popularly elected for the purpose of revising the constitution, are the usual method where a *general revision* of the constitution is sought. In most states the proposal to call a constitutional convention is submitted to popular vote, and in 14 states—Alaska, Connecticut, Hawaii, Illinois, Iowa, Maryland, Michigan, Missouri, Montana, New Hampshire, New York, Ohio, Oklahoma, and Rhode Island—the constitution requires that such a proposal be submitted regularly at the conclusion of a certain interval of years. In Georgia, Louisiana, Maine, South Carolina, and Virginia, the legislature may call a convention without popular approval. In 9 states—Arkansas, Indiana, Massachusetts, Mississippi, New Jersey, North Dakota, Pennsylvania, Texas, and Vermont—there is no provision for calling a constitutional convention.

Popular Initiative. Amendment by popular initiative is now authorized in Arizona, Arkansas, California, Colorado, Florida, Illinois, Massachusetts, Michigan, Missouri, Montana, Nebraska, Nevada, North Dakota, Ohio, Oklahoma, Oregon, and South Dakota. The petition must be signed by a definite number of voters or by a number equal to a certain percentage (3 to 15) of the total vote cast for some state officer at the last preceding election. Once the signatures are verified, the measures are submitted to the people at the next general election. In Massachusetts the popularly initiated amendment must receive the approval of at least one-fourth of all members of two successive legislatures and the legislature may submit a competing or substitute measure.

Popular Ratification. The practice of referring to popular ratification constitutions framed or revised by a convention has steadily grown. The early constitutions, except in New Hampshire and in Massachusetts, were not submitted to the people, but from 1784 to 1840 all such constitutions were submitted except in the cases of Delaware, Minnesota, and Arkansas.

During the Civil War period the practice was against submission. Between 1870 and 1890 there was a return to the pre-war practice and all constitutions drafted by conventions were submitted to popular ratification. From 1890 to 1910, of eleven constitutions adopted, five were popularly ratified. Since 1910, many new constitutions or important revisions have been effected by constitutional conventions, and, in almost all cases, these constitutions were popularly ratified.

CONSTITUTIONAL LIMITATIONS UPON THE POWERS OF STATE LEGISLATURES

By the Constitution of the United States, all legislative powers not expressly bestowed upon the national Congress are reserved to the states. Thus no enumeration of the powers of a state legislature is necessary in a state constitution. "All residuary legislative power" being implied, the only original restraint is that state laws must not conflict with the Constitution of the United States, with the laws of Congress, or with United States treaties.

The early state constitutions were framed at a time of great popular confidence in elected legislatures. Gradually, however, as legislatures were tempted into passing unrepresentative legislation or yielding to corrupt influences, restrictions upon the powers of legislatures were introduced by amendments to state constitutions. Louisiana in 1845 and Iowa in 1846 adopted constitutional provisions that forbade "special legislation." The constitution of Michigan (1847) and that of California (1849) contained similar restrictions on the legislature.

Special Municipal Laws. The purpose of these changes was to prohibit the legislatures from appropriating money or conferring other benefits upon private individuals or corporations. In 1850-51, the states of Ohio and Indiana prohibited state legislatures from passing special laws for municipalities. This action was to remedy a growing abuse of interfering with municipal government and even of penalizing cities in the interests of partisan politics.

The movement initiated by Ohio became general, particularly in western and southern states. Five-eighths of the states have adopted constitutional provisions that no special law shall be enacted where a general law can be made applicable. In the New England states alone are the legislatures generally free to enact laws applying to a particular person, city, town, or other corporation.

Legislative Freedom. Undeniably, the process of placing fetters upon state legislatures was carried too far and resulted in denying to state legislatures a discretion which was properly theirs and which would be to the interest of state government to exercise. A movement became apparent to restore to state legislatures a freedom which

nearly a century of constitutional amendment largely destroyed. The adoption by many states of the legislative referendum created a popular check upon vicious legislation and legislative favoritism, while the legislatures themselves became more powerful.

STATE LEGISLATURES

In all American states excepting Nebraska, which voted to adopt the unicameral legislature in 1937, the legislative power is intrusted to a representative body consisting of two chambers and usually known as the state legislature, or general assembly. In Massachusetts and in New Hampshire it is called the general court. The bicameral or two-chamber plan has been adopted in American states in obedience to the "theory of checks and balances," one house halting and correcting the wrong or impulsive action of the other. In all states the "upper" and uniformly smaller body, being elected for a longer term and with sometimes a higher age qualification for its members, is called the Senate. The larger or more popular house in all but four states is called the House of Representatives; in the others it is called the Assembly.

Qualifications. In all states the qualifications for voting for both houses are the same. The "aristocratic" character of the electors of the upper house long ago disappeared. Among the qualifications for election, certain states require a higher age for the Senate (sometimes 30 years) than for the lower house (18 to 25 years). Residence in the state for a prescribed term before election to the legislature is a usual condition, as is residence in the district from which a member is chosen. This last requirement has the result of increasing the representative's responsibility to his constituency, since, if defeated by unpopularity in the district in which he resides, he cannot without change of residence stand for election in another. Federal officeholders are generally ineligible, as are paid officials of the state, with certain customary exceptions (notaries, national guard officers, soldiers, etc.).

Organization and Legislation. State constitutions usually provide that the lieutenant governor or vice governor shall be the presiding officer of the Senate, and provisions have been introduced into many constitutions regarding the procedure of legislation, the publication of bills, etc. Other than these, both houses are free to organize themselves in their own way. The American system of legislative committees everywhere prevails. Members of either house have an almost unlimited privilege of introducing bills, which, after being read by title, are referred to the appropriate committee for examination. The unrestrained practice of introducing bills results in legislatures being burdened, at each session, with bills which cannot be properly examined or discussed.

The interest felt by members in the passage of their bills and the political reputation made or lost by the success or failure of such measures leads to the practice of members supporting one another's projects in return for support of their own, and results in the loading of American statute books with ill-digested, unwise, and practically undebated laws.

Another embarrassment to American state legislation is the mass of detail written into statutes, the effort of the legislator being to cover every possible assumed contingency. These provisions, being frequently purely theoretical and not based upon experience with the measure, usually require a large amount of amendment or alteration by subsequent legislatures with resulting delays and embarrassments in their enforcement.

Distrust of state legislatures and apprehensions felt as to radical action by them led, in many states, to constitutional provisions limiting the frequency of legislative meetings and the duration of their proceedings. The earlier practice of annual meetings of legislatures gave way to biennial legislatures. After World War II, this process was reversed. Legislatures became more important as the matters before them became more complex. In most states, the legislatures were reestablished as coequal to the executive branch.

The design of the United States gave each state exclusive jurisdiction over many aspects of laws and regulations, creating a diversity to counteract the authority of the central government. But too many differences would tend to discourage free passage by people and commerce. In 1890, the National Conference of Commissioners on Uniform State Laws was established to advise state legislatures on areas in which a uniformity of codes would be desirable. States are under no compulsion to adopt the uniform acts. The institution has drafted legislation in such diverse areas as criminal extradition procedure, motor vehicle laws, commercial codes, and divorce laws.

Legislative Bureaus. A device to avoid defects of drafting, duplication, and other bad features of state legislation was the creation of offices providing legislative staff services, diversified and multilayered with full-time, year-round personnel. In some states, they are organized as joint, nonpartisan agencies, and in others, as partisan committees that work through party leadership. Experts within each bureau advise legislators on such matters as bill preparation, legal authority, and policy analysis. All 50 legislatures have staffs to review and analyze budget and fiscal actions of their states. The staff services also help to provide continuity between sessions.

Legislative Councils. Led by Kansas and Michigan in 1933, a number of states established legislative councils with paid staffs to study, plan for, and prepare legislative proposals in advance of the sessions. They usually consist of legislators only, but may include administrative officers.

Members of state legislatures receive compensation for their services; but this compensation varies greatly in different states, as may be seen from the table *Tabulated Data on State Governments*.

REFERENDUM AND INITIATIVE OF LAWS

The original sole competence of legislatures to enact laws has been modified in 39 states by the adoption of the "legislative referendum" and in 21 states by the "legislative initiative." These modifications of "representative government" are Swiss devices and were first adopted in America as joint measures by the state of South Dakota in 1898. While usually associated, the two institutions are unlike in spirit, the referendum being a conservative practice, the initiative, radical.

A referendum of constitutional measures, as stated above, dates from the early Revolutionary constitutions. The practice is old, also, of requiring local bond issues and exceptional fiscal measures to be ratified by voters of state, county, school district, or city. But, since the example of South Dakota, the practice has spread of giving to the people the right of annulling an act of the legislature or of originating laws to be submitted to popular judgment either without legislative consideration, "direct initiative," or together with a similar measure proposed by the legislature in its place, "indirect initiative."

The referendum of a law is accomplished by securing signatures to a petition to suspend the operation of the act and to submit it to popular judgment as expressed at a general election. The number of signatures required is usually 5 per cent of the votes of the state. Such a petition must be signed and submitted to the secretary of state for verification within a certain period (usually 90 days) following the adjournment of the legislature. States possessing referendum procedures only are Florida, Georgia, Illinois, Iowa, Kansas, Kentucky, Maryland, New Hampshire, New Jersey, New

Mexico, New York, North Carolina, Pennsylvania, Rhode Island, South Carolina, Vermont, Virginia, and Wisconsin.

The states possessing both initiative and referendum are Alaska, Arizona, Arkansas, California, Colorado, Idaho, Maine, Massachusetts, Michigan, Missouri, Montana, Nebraska, Nevada, North Dakota, Ohio, Oklahoma, Oregon, South Dakota, Utah, Washington, and Wyoming. The number of signatures required to place an initiative measure on the ballot ranges from 3 per cent of the votes cast in the last general election for governor in Massachusetts to 15 per cent of the voters in the last general election in Wyoming. Most states require from 8 to 10 per cent of the votes cast for some state official in the last election.

In each state where initiative and referendum occur, a majority of the popular vote is required to enact a measure. Idaho stipulates that the majority must be equal to the majority of total votes cast for governor at such an election. Massachusetts requires the majority to be equal to 30 per cent of the ballots cast in the election.

In a number of states that possess initiative, a still higher requirement exists for the initiative of a constitutional amendment. Alaska, Idaho, Maine, Utah, Washington, and Wyoming make no provision for the popular initiative of a constitutional amendment.

THE GOVERNOR

The executive power in all American states is intrusted to a governor. The office, both in its functions and in its title, is an inheritance from the colonial period. The Revolution substituted the practice of popular election of the governor for that of appointment. In all states the governor is directly elected by the qualified voters, for a definite term.

Qualifications. Among the qualifications for election as governor frequently provided by state constitutions are American citizenship, previous residence in the state of from 1 month in Rhode Island to 10 years in Missouri. The minimum age is usually thirty, but in some states the candidate must only be a qualified voter. In eight states, the governor is not eligible for re-election. The term varies from 2 years (4 states) to 4 years (46 states).

Authority of Governor. As the period of early state constitution making showed a confidence in legislatures, so it exhibited a marked distrust of executive or gubernatorial authority. This prejudice survived the entire first century of the history of state governments. In no state had the governor an administrative power over state affairs comparable to that of the president over national administration. The executive departments were entrusted to officers popularly elected and independent of the governor's control. It was thus impossible to hold the governor responsible for the general conduct of the state's business and equally impossible for him to enforce a consistent policy throughout the state administration. The governor seldom had the power of appointment of state or local officials, nor the right to remove for negligence, inefficiency, or malfeasance. Beginning with the second decade of the present century, however, came a movement to enlarge the authority of the governor over state administration. One proposal was that of the so-called "short ballot," whereby a governor alone would be elected, other state officials being generally his appointees. More recently, in many states radical reorganization has been effected, both by constitutional amendment and by legislation. State services have been centralized, or organized in departments, with the suppression of numerous independent boards and commissions. The department heads are made appointable and removable by the governor, and in some states now sit with the governor as an administrative and advisory "cabinet." There has been an increase in the number of officials holding office at the pleasure of the governor rather than for fixed terms. One of the most radical of such measures was that passed in Iowa in 1933 centralizing financial control in the hands of the governor. A somewhat similar measure was passed in New Jersey the same year. The trend has been toward lengthening the governor's term.

On the political side, the position of governor is an honorable and conspicuous one. His influence in state and national politics is great, and tends to increase. It is from the class of successful state governors that strong presidential candidates are usually derived. The dignity and the influence of the position are sufficient to attract, as candidates for the office, able and representative citizens. Nevertheless American state administration remains generally "decentralized" in contrast to the national administration.

The Veto Power. Although the office of governor was originally conceived as entirely distinct from the legislative power, the "doctrine of separation of powers" being generally avowed by American state constitutions, the governor has come to possess a great influence over the legislature and its legislation. This has been accomplished in several ways. First, by the bestowal upon the governor of the veto power.

In the earlier state constitutions, the veto power was generally absent, but, by successive amendments, it has been created until now it exists in all states except North Carolina. Only four state constitutions withold the governor's right to veto a constitutional amendment. Furthermore, in 43 states the governor may exercise a veto on any item in an appropriation bill. Since most states require a two-thirds vote in both the House and Senate to override a veto, this provision enables the governor practically to determine the state's budget, and places upon him the responsibility of defeating riders to appropriation bills. Public opinion in American states, furthermore, has come to require the governor to frame and press upon the legislature at each session an "administrative program."

Influence on Legislation. The influence possessed by the governor over legislatures, not only by the importance of his position, but by his power of vetoing bills in which members are interested and by reason of his leadership in the party, gives a special character to what are called "administrative measures" or bills proposed or supported by him, and it is hardly too much to say that the governor is today judged quite as much for the legislation which he secures as for his general conduct of the state's executive business.

A governor, faced with an unwilling legislature, frequently goes directly to the people of the state, and, through interviews or radio addresses, organizes the force of public opinion to bear upon the legislature to favor measures upon which he has staked his political reputation. These practices, while they have contradicted the theory of the separation of powers, undoubtedly have introduced into American state government a necessary authority and have enabled the voters of the states to hold the government to a closer responsibility.

The Power to Pardon. Another important power of the governor is that of pardon. This power may be classified in its several forms as the power to "commute" a sentence or reduce it below the punishment fixed by a court, the power to "pardon" or entirely free a person from the consequences of guilt, the power to grant "reprieves" or postpone sentence, and the power to remit fines and forfeitures.

In 32 states the sole power of pardon, except in cases of treason or impeachment, resides in the governor; in 29 states the governor alone has the power to commute sentence. In 41 states he has the sole power to grant reprieves and in 22 states the

sole power to remit fines and forfeitures. In 12 states the governor has the power to pardon, when acting with his council, or on the recommendation of a board of pardons; in 9 states he similarly exercises the power of commuting sentence; and in 6 states he similarly exercises the power of remitting fines and forfeitures. In 6 states, however (Connecticut, Florida, Idaho, Nevada, New Jersey, and Utah), the pardoning power resides exclusively in a board of pardons.

The power of remitting fines or forfeitures is less frequently confided to the governor, and 21 states by constitutional provision entirely prohibit its exercise.

STATE OFFICERS

Besides a governor and a lieutenant governor (in 38 states), the usual officers are a secretary of state (all states), an attorney-general (all states), a treasurer (all states except New York), an auditor or comptroller (all but 3 states), and a superintendent of public instruction (all states). These are usually popularly elected at the same time and for the same term as the governor. In a few cases the secretary of state (Delaware, Maryland, New Jersey, New York, Pennsylvania, Texas, Virginia), or the superintendent of public instruction (7 states), is appointive by the governor, while in a few states (Maine, New Hampshire, New Jersey, Tennessee) one or more of these officers may be elected by the legislature. In 8 states the school superintendent is elected by a board of education. Other usual officers are the adjutant general of the national guard or state militia, of which the governor is the commander in chief, and a surveyor-general, or a registrar of lands.

As stated above, by recent legislation in a few states, the heads of departments now constitute a "cabinet" of the governor. Usually, however, they perform their duties independently of him and may even represent political parties other than that with which the governor is affiliated.

Nearly all other state offices have been created, not by the constitution, but by legislation, and have come into existence gradually as the state has assumed added responsibilities or taken private professions and certain classes of business under its control.

Types of Administration. Several types of administration have been adopted to discharge new forms of state business: (1) the "*ex officio* board," composed of the governor, secretary of state, the attorney-general, an executive officer, and frequently other members; (2) the "lay board," a corporation of citizens, unsalaried, and usually appointed by the governor for fixed terms, with the power to choose the executive of a state institution (educational, penal, charitable, etc.), and to direct its conduct; (3) a "bureau type" where a branch of administration is intrusted to a single directive head (commissioner of insurance, banks, corporations, etc.); (4) the "commission type" where public business is intrusted to a salaried board whose members are considered technically qualified or expert administrators and who have a joint or "collegiate" responsibility (public service commissions, boards of control, etc.).

Boards and Commissions. Practically all states have public service commissions, charged with regulating public utilities. Admission to the practice of certain professions is secured in most states only after examination and certification by boards composed of selected representatives of these professions (law, medicine, dentistry, pharmacy, architecture, public accounting). The number of these offices, boards, and commissions has multiplied to an astonishing degree, many states having over 100 such bodies. The system has obvious disadvantages; viz., duplication of expense, overlapping functions, absence of responsibility, and undue independence of common administrative authority.

REORGANIZATION OF STATE GOVERNMENT

Reorganization of state administrations to assure simplicity, efficiency, economy, and responsibility is a perennial problem of American government. Because the citizens of a state are already obliged to meet growing demands from federal and local governments, the raising of state income is increasingly difficult. And yet, the states have many long-term commitments as well as unpredictable expenditures. In fiscal 1966, for example, the estimated revenue from state and local sources was $85 billion. From time to time different state administrations have made serious efforts to reduce expenses. Sometimes overlapping services have been consolidated into fewer departments, sometimes commissions have been organized to operate independent of executive control, and hence comparatively free from political pressure. In some instances central purchasing agencies and bureaus of audit and investigation have been added. In recent years such matters peculiar to the states have been discussed at Governors' Conferences.

Some forms of reorganization have increased, instead of limiting, the power of the governor. The aim has been to make him the head of the state administration as the president is of the federal government, with power to appoint and remove heads of departments and directors in charge of administrative services. Such reorganization has been accomplished by constitutional amendment where necessary, or by legislation. In some states the governor has control of the budget, as in California, New York, Iowa, and New Jersey. In Iowa the spending agencies must submit quarterly estimates to the governor, who is empowered to cut allowances not covered by prospective revenue income.

CIVIL SERVICE

One consideration operating against the "short ballot" and the enlargement of the governor's control of state administration is fear of the misuse of this power to reward political adherents and to create "political machines." The number of employees in certain states is large (202,000 in New York). The unrestricted power to employ and to dismiss so great a force undeniably offers opportunities for serious abuses. While the power to appoint department staffs is legally vested in the heads of the offices, the actual choice may be made by party leaders or "bosses" regardless of the efficiency of the service. Public service has become highly specialized and can be well discharged only by trained and conscientious officials holding office for considerable terms and free from the disturbing vicissitudes of party contests.

Tenure of Office. As in the Federal service, so in the state, including local and municipal administration, advocates of civil service reform have sought to secure laws establishing a "merit system" for public office with security of tenure for competent and faithful public servants. The movement, however, has not met with wide success, and, as yet, no state has adopted a general standard for determining the fitness of aspirants to all offices, local as well as state.

Civil service laws provide for general coverage in 30 states and apply to selected departments in the other 20 states. Federal requirements provide that state employees handling federal funds must be chosen by civil service procedures. The usual method of administering a civil service system is by a commission, which is given power to "classify" the public positions, fix qualifications for each grade of employment, hold examinations to determine fitness, certify "eligibles" to the appointing power, keep official service records of employees, and in some cases to try or investigate charges of unfitness. Civil service laws usually declare public positions open on equal conditions to both men and women.

THE RECALL

The recall has been defined as "a special election to determine whether an official shall be superseded before the ordinary expiration of his term." It is in use in 13 states: Alaska, Arizona, California, Colorado, Idaho, Kansas, Louisiana, Michigan, Nevada, North Dakota, Oregon, Washington, and Wisconsin. In 8 of the states, all elected officials are subject to recall, while in the other 5 judges are exempt (Idaho, Kansas, Louisiana, Michigan, and Washington). The most common requirement for the number of signatures on a recall petition is 25 per cent of the voters in the last general election in the jurisdiction affected. In each state where a recall election might occur, a majority vote recalls the official.

LOCAL GOVERNMENT

The organization of local government (county, township, district, municipality) is entirely a function of the states. Local government serves two purposes: (1) the need of the state for agencies in conducting its administration and enforcing its laws in the subdivisions of the state; (2) the need of communities for organization to satisfy local or community needs. Theoretically, a county may be considered a local agency of the state and a town or city a community organization for determining and supplying its own public wants; but actually state and local activities overlap, or merge and separate in response to an altering social order.

Education, public health, charities, and communications are likely to command the interest of both the state and the town. Justice and preservation of public order are clearly state, not local, functions; but the American practice of "decentralizing" public authority and a prejudice for local self-government have influenced the state usually to leave these essential services to be performed by judges and peace officers locally elected and responsible only to the people of the locality.

Division into Counties. All of the 50 states are divided into counties (in Louisiana called "parishes"). Within the counties (largely rural in character), cities and towns exist as incorporated municipalities. There are more than 3000 counties in the United States, the average number for each state being more than 60. But Delaware has only 3 counties, Rhode Island has 5, while Texas has 254. In New England, county government is mainly limited to the administration of justice, though the county may be a unit of senatorial representation. Elsewhere, it is the usual unit for maintaining roads and bridges, for poor relief, for school administration, and in some states for health supervision and for agricultural aid.

County Government. County government is organized according to no general principle. Outside of Connecticut, Rhode Island, and Georgia, there is an elective board of commissioners or supervisors, with powers, in southern and western states, to assess county taxes, to care for county property, to maintain highways and roads, and to conduct county institutions. In addition, the usual officers are the judge or judges of the county or "superior" court, the sheriff, the attorney, the clerk, the recorder of deeds and other instruments, the assessor of taxes, the collector of taxes, the school superintendent, the health officer, etc. The term of office varies from two to six years.

There is an absence of any responsible head for the county administration and usually county officers are subject to a little or to no state supervision. Removal power is rarely placed in the hands of the governor.

MUNICIPAL GOVERNMENT

In 1970, the population of standard metropolitan areas in the U.S. was about 140,626,400. The metropolitan area is considered to be the urban area around and including each important city of about 50,000 or more.

City government in the United States follows no accepted plan. Three chief forms are found: the mayor and council plan with separation of executive and legislative functions; the "commission" plan; and the "city manager" plan. The first is the most common. The mayor is popularly elected and may be given a veto over legislation of the council and a large control over city offices. Earlier practice was to divide the council into two chambers.

Commission Form of Government. The commission plan had its origin in Galveston in 1901. It has been adopted in all parts of the Union but particularly in Pa., N. J., Ill., Kans., Okla., and Tenn. Pennsylvania, in 1913, made commission government compulsory for all cities of the third class. Cities of largest population which have employed this form are Newark, N. J., New Orleans, La., Jersey City, N. J., Portland, Ore., St. Paul, Minn., Oakland, Cal., Omaha, Nebr., Birmingham, Ala., Memphis, Tenn., San Antonio, Tex., Dallas, Tex., Houston, Tex., Des Moines, Iowa, Trenton, N. J., Salt Lake City, Utah, Reading, Pa., Spokane, Wash. Under this plan both executive and legislative functions are entrusted to a commission, usually of five. They are popularly elected and are chosen, not by districts, but "at large," though not necessarily all at the same election. This commission employs the city officials and directs the entire administration. In some instances it appoints a city manager, as explained below.

City Manager Plan. This plan was first tried in Staunton, Va., in 1908. Dayton, Ohio, in 1913, was the first large city to adopt it. Between that date and 1945, approximately 450 American cities altered their charters or ordinances to provide for city managers. The maximum number of adoptions, 53, occurred in 1921. In addition to these American cities, 17 cities in Canada and 2 in New Zealand have adopted the plan. Under this plan the elected city council or commission engages a manager who is the head of the entire municipal administration and confines its attention to determining policies, raising revenue, making appropriations, and supervising the administration of the manager.

Municipal Charters. Municipal governments under the American legal system have only those powers and functions which are specifically given them by their charters or by statutes. Originally a city was incorporated and provided with a charter by an act of the legislature. This practice has been altered in two ways: first, by the provision of standard types of city government (corresponding to populations of different sizes or "classes") laid down in "general laws"; and, secondly, by allowing city populations to frame their own charters, which, when ratified by the legislature, become effective.

"Municipal home rule" is now provided for by the constitutions of 31 states and by statute in 8 states. In many of these states minimum population requirements exist for eligibility, ranging from 2,000 to 10,000. Others allow a choice of a few specified forms of governments. Home rule is intended to give communities greater freedom and authority in the structure of their government and in matters primarily of local concern.

DEPENDENCIES

The Spanish American war of 1898 brought new responsibilities which made the United States one of the principal "colonial powers" of the world. The chief scene of hostilities was Cuba, and that island was conquered from Spain in 1898. Puerto Rico and the Philippines were ceded outright by Spain to the United States by the treaty of Paris, ratified in 1899. The acquisition of the right to build the Panama Canal, with other responsibilities also, flowed from the war and resulted in practical acquisition of the Canal Zone although Panama retained the right to fly its flag there beside the American flag.

The liquidation of the American "colonial empire" began early. Cuba was given its freedom in 1903, subject to the right of American intervention in case of civil disorder—a right which was exercised a number of times before its abrogation in 1934. A naval base on the island was also retained.

The Philippines was granted independence in two steps. By the first, in 1934, the Philippines became a "dominion" for a ten-year transitional period. The period expired during World War II, which had the effect of postponing the final step until 1946.It then became an independent republic.

Puerto Rico. After a period of military rule, a liberal government was created for the island of Puerto Rico, which was modified by the Organic Act of Congress of 1917. This act granted American citizenship to the people of Puerto Rico. Legislative power is vested in two houses, a Senate of 29 members and a House of Representatives of 54 members. These are elected partly from districts and partly at large. The franchise is possessed by all citizens, and no property qualifications may be imposed. The governor, who ruled with an executive council of department heads, was appointed by the president.

In August 1947 the Organic Act was amended in response to long continued demands from the island. By the new law the governor is elected for a term of four years, beginning in August 1948, by the Puerto Rican people. The governor now appoints the department heads. The president appoints the auditor and a co-ordinator of federal agencies. The new constitution drafted by the people of Puerto Rico was approved by Congress July 3, 1952. It made Puerto Rico a commonwealth.

The judiciary consists of a United States District judge and a supreme court of 9 justices, appointed by the governor. There are also 11 superior courts, 39 district courts, and justices of the peace.

Puerto Rico has a resident commissioner in Washington who has a voice but not a vote in the House of Representatives.

Virgin Islands. The Virgin Islands, formerly known as the Danish West Indies, were purchased by the U.S. from Denmark in 1917 for $25 million. At first all governing powers were vested in the governor. Legislative power is now vested in a single-chamber legislature composed of 15 senators popularly elected for 2-year terms from the two districts of St. Croix and St. Thomas-St. John. Until 1970 the governor was appointed by the president; he now is elected. Suffrage is extended to residents who are U.S. citizens over 18. The islands are supervised by the Department of the Interior.

Canal Zone. By treaty with Panama, ratified 1904, the United States acquired title to the Canal Zone, a strip 10 miles wide, with use and control of waters and islands at each end of the canal for purposes of construction, maintenance, or defense of the canal. See *Panama*. This interoceanic strip is, by act of Congress of 1912, placed under the control of the president, who commits its administration to a governor, who is an army officer. Negotiations were under way in 1976 to draw up a new treaty between the United States and Panama.

Guam. The largest island of the Ladrones or Marianas group, ceded to the United States by Spain in 1898. It is an important strategic outpost, an air and naval base, and a communications center.

Its affairs were formerly administered by the Navy Department, a naval officer acting as governor; but by executive order of President Truman the civil administration was placed in charge of the Department of the Interior, the transfer being completed in June 1950. A month later U. S. citizenship was granted to the inhabitants.

Until 1970 the governor was appointed by the U.S. president; presently, he is elected by the residents of Guam to a 4-year term. There is a single-chamber Guamanian Congress elected by permanent residents. Its powers are largely advisory; however, a veto of the governor may be overridden, and an appeal taken directly to Washington. There is a court of appeals, with an island court; a justice court; and a police court, without juries.

Guam was captured by the Japanese in December 1941, but was retaken by United States forces in July 1944. The capital and port of entry, Agana, was totally destroyed during World War II, but has since been rehabilitated.

Samoa. American Samoa, the principal island of which is Tutuila, was acquired by the United States through a tripartite treaty with Great Britain and Germany, November 14, 1899, whereby the other two countries renounced claims over this part of the Samoan islands. America had been in the islands, however, since 1872, when the harbor of Pago Pago was purchased from a native king. Since 1951 this dependency has been supervised by the Department of the Interior, with a civilian governor. Before that it was controlled by the Navy Department and a naval officer was governor. A bicameral legislature with advisory powers chosen by the Samoans was established in 1948. There are district and magistrates courts, and a High Court with a chief justice, who is an American civilian; all other judges are natives. Native lands may not be sold to foreigners.

Pacific Islands. A number of small islands in the Pacific ocean are important in naval defense and for trans-Pacific aviation. These are:

Midway and *Kure* islands, 1,200 miles northwest of Hawaii, claimed by the U.S. since 1867; under the control of the Navy Department.

Wake Island, midway between Hawaii and Guam; formally claimed in 1900 and under the control of the Federal Aviation Agency. The island serves as an important commercial aviation base.

Johnston and *Sand* islands, known as the Johnston Atoll, were annexed by the U.S. in 1858 and are under the jurisdiction of the Navy Department.

Kingman reef, on the direct route to Samoa; annexed by the U.S. in 1922 and under the Navy Department.

Palmyra Island, administered by the Interior Department.

Howland, *Jarvis* and *Baker* islands, near the equator, were assigned to the Interior Department in 1936.

Corn Islands, leased to the U.S. in 1916 for a period of 99 years by Nicaragua.

Canton and *Enderbury* islands, controlled jointly by the U.S. and Britain. They formerly were used for aviation purposes but now are uninhabited.

Caroline, *Marianas*, and *Marshall* islands, known as Micronesia, were formerly a Japanese mandate and are now a U.S. trusteeship under the UN. In 1976 the Northern Marianas became a commonwealth of the U.S.

Protectorates. During the first three decades of the 20th century, the United States acquired protectorates, official or unofficial, over Cuba, Panama, Haiti, Dominican Republic, and Nicaragua. These relationships were largely abrogated by treaty revision or withdrawal of troops during the administration of President Roosevelt beginning in 1933. The United States returned the Ryukyu Islands, including Okinawa, to Japan on May 15, 1972. The islands had been under the jurisdiction of the United States since 1952.

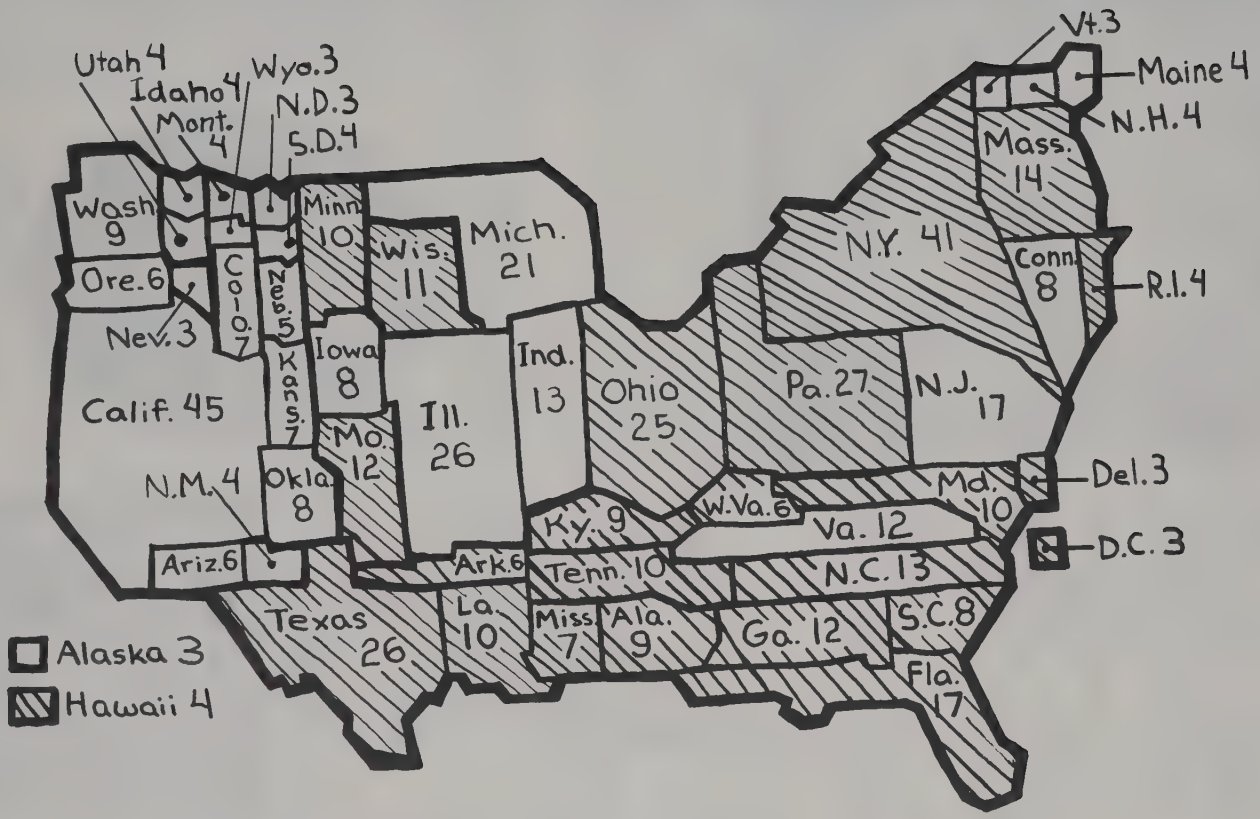
* The Voting Rights Act of 1965 temporarily suspended literacy tests and other voter-qualification devices nationwide. The ban became permanent in 1975. The Voting Rights Act was amended in 1970 to include a ban on long residency requirements for voting in presidential elections and a provision for a 30-day residency requirement, which was upheld by the Supreme Court the same year. In 1972 the Supreme Court ruled lengthy residency requirements for state and local elections unconstitutional and suggested a 30-day residency requirement. Every state requires that voters be U.S. citizens. The Twenty-sixth Amendment to the Constitution ratified in 1971 lowered the minimum voting age to 18 for all federal, state, and local elections. † Unofficial. ‡ The Twenty-third Amendment to the Constitution ratified in 1961 extended presidential suffrage to the District of Columbia.



U.S. Presidential Election Map—1976. In this map, the 50 states have been sized in relation to their populations. To win the election, 270 electoral votes were required. The Republican candidate, Gerald Ford, received 240 votes. One elector from the state of Washington cast his vote for non-candidate Ronald Reagan, a symbolic gesture made after the contest had already been decided. The winner, Democratic candidate Jimmy Carter, received 297 votes. The states shaded with diagonal lines cast their electoral votes for Carter.

POPULAR AND ELECTORAL VOTE FOR PRESIDENT AND VICE PRESIDENT FROM 1789 TO THE PRESENT

Strictly speaking, there is no popular vote for president and vice president; the people vote for electors, and those chosen in each state meet therein and vote for the candidates for president and vice president. Each state has as many electors as it has Representatives and Senators, plus 3 electors from Washington, D.C., making a national total of 538. The number of each state's representatives is determined by the decennial census and the ratio of the state's population to the country as a whole. The first House of Representatives in 1790 had 65 members. Since 1912 the total membership in the House has been 435. The record of any popular vote for electors prior to 1824 is so meager and imperfect that a compilation would be useless. In most of the states, for more than a quarter century following the establishment of the government, the state legislatures "appointed" the presidential electors, and the people therefore voted only indirectly for them, their choice being expressed by their votes for members of the legislature. In this tabulation, only the electoral vote for candidates for president and vice president in the first nine quadrennial elections appears. In a few instances, candidates receiving an extremely insignificant number of votes have been omitted.

* Prior to 1804 each elector was entitled to vote for two candidates for president. The candidate receiving the greatest number of votes was declared elected, while the candidate receiving the next highest vote was declared vice president.

† Three states not voting. New York legislature failed to agree on electors; N. Carolina and Rhode Island had not ratified the Constitution.

‡ The Democratic-Republican (also called Republican) party was the predecessor of the present Democratic party.

†† "Vacancies" means electors absent or not voting.

§ As there was no election the choice was decided by the House of Representatives.

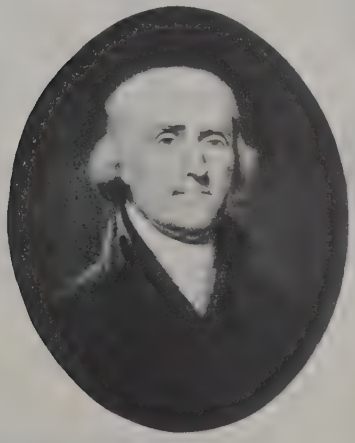
Vice President and President of the Senate

The Vice President, who is constitutionally designated presiding officer of the Senate, is a unique figure in our government. He is the only official with duties both in the executive and legislative branches. For many years the Vice President was not much more than "the man in the wings" waiting to fill the void should a vacancy occur in the presidency.

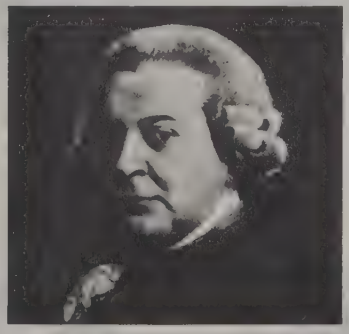
Since Harry Truman's presidency, however, the role of the Vice President has been steadily expanded.

The Constitution states the key role of the President of the Senate as follows: "The Vice President of the United States shall be President of the Senate, but shall have no vote, unless they be equally divided."

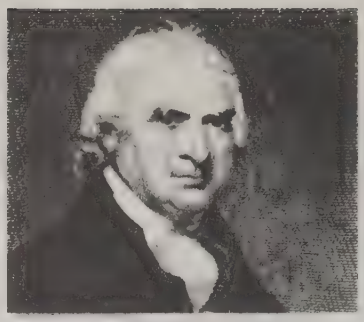
THOMAS JEFFERSON, Virginia, presided over the Senate (1797) as Vice President, under John Adams, and was elected third President of the United States.



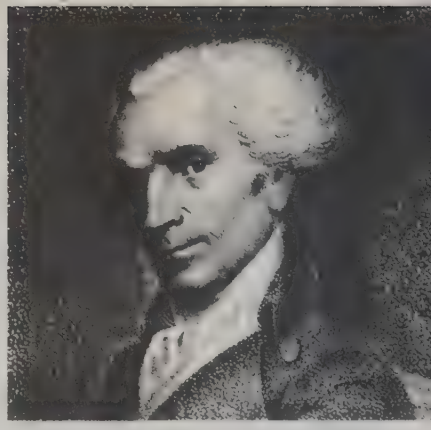
JOHN ADAMS, Massachusetts, a Federalist, first President of the Senate and Vice President (1789); second President of the United States.



AARON BURR, New Jersey, was Jefferson's Vice President (1801), an able but disturbed politician, whose duel with Hamilton, and sad decline ruined his place in history.

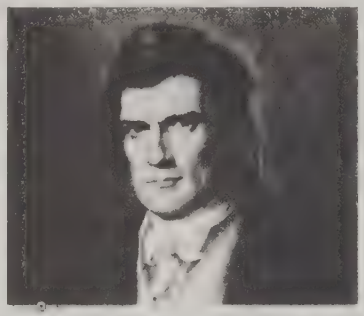


GEORGE CLINTON, New York, Vice President (1805) in Jefferson's second term. (an Uncle of the better known De Witt Clinton), a member of the Continental Congress in 1775–76; served also as Vice President under James Madison.



ELBRIDGE GERRY, Massachusetts, was vice President (1813) under James Madison. A signer of the Declaration of Independence, later elected Governor of Massachusetts.

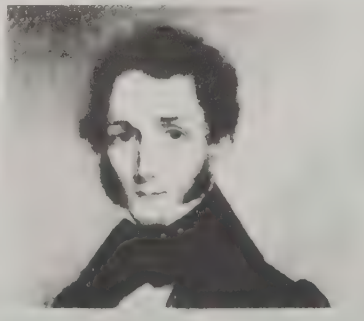
DANIEL D. TOMPKINS, New York, Vice President (1817) under James Monroe. Tompkins was Governor of New York and one of the founders of the New York Historical Society; re-elected with Monroe in 1820.



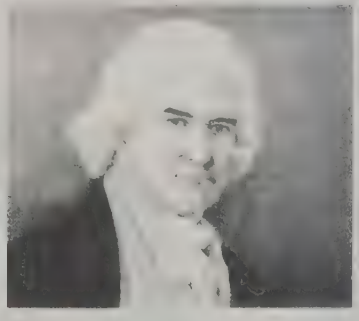
JOHN C. CALHOUN, South Carolina, Vice President (1825) under John Q. Adams. One of the south's great statesmen. Re-elected Vice-President 1828 on the Jackson ticket.

MARTIN VAN BUREN, New York, was Vice President in the Jackson administration (1833) when Calhoun resigned on his election to the Senate. Succeeded to Presidency 1837.

RICHARD M. JOHNSON, Kentucky, Van Buren's Vice President (1837), soldier and Senator, voted into Vice-Presidency by the Senate, because regular candidates failed of majority of electoral votes.



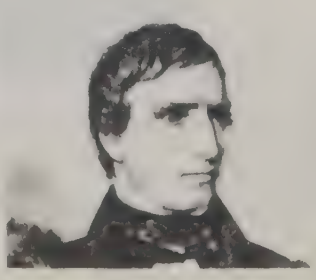
JOHN TYLER, Virginia, Harrison's Vice President (1841), Representative and Senator, Governor, succeeded to Presidency on Harrison's death, was subject of the spirited campaign slogan: Tippecanoe and Tyler, too.



GEORGE M. DALLAS, Pennsylvania, James K. Polk's Vice President (1845), Van Buren's Minister to Russia; President Pierce's minister to Great Britain; one time Mayor of Philadelphia.

MILLARD FILLMORE, New York, Zachary Taylor's Vice President (1849) succeeding him to the Presidency when Taylor died, fought in the Civil War on Union side, prominent in state and national politics.

WILLIAM R. KING, North Carolina, Franklin Pierce's Vice President (1853), was a Senator from Alabama, after having served as Representative from North Carolina. He also served as President pro tempore of the Senate.



JOHN C. BRECKINRIDGE, Kentucky, James Buchanan's Vice President (1857) in the controversial era before Civil War—youngest Vice-President up to that time, defeated for Presidency by Lincoln.

WORLD GOVERNMENTS

THIS section on World Governments comprises the accounts of all independent states, other than the United States of America, which are recognized as possessing "sovereignty." The usual test of sovereignty is the recognized conduct of foreign affairs through fully accredited diplomatic agents. Nearly all sovereign states are members of the United Nations, but such membership is not a test of sovereignty. Some old and powerful nations are not members, and some constituent republics of the Soviet Union are members.

Earlier Forms of Government. The earliest form of political organization goes back to the tribe, which itself is an extended form of the family. The chief held absolute power. When hunting as the means of subsistence gave way to agriculture and husbandry, it was possible to store the means of subsistence, initially in the form of grain, cattle, and land. These constituted wealth, and usually the control of wealth spells power. Cities then for the first time became possible with a multitude of new activities—industry, trade, better weapons, and organized armies. Writing was invented initially to keep records of wealth but soon was utilized to strengthen control by the more powerful. Kings succeeded chiefs of the earlier tribal ages. More powerful cities extended their power over their weaker neighbors, thus creating empires which rose and fell with the fortunes of war. The king held power of life and death over his subjects and, in general, was the source of all law. Such was the picture in the parts of the world where the early civilizations arose on the Nile and the Tigris. These spread through southwestern Asia and northeastern Africa and made their way into southeastern Europe over a period of several thousand years.

Toward the Modern Age. Beginning in the 5th century B.C., came a so-called Golden Age. In the city states of Greece, the power of the kings was first broken, authority was shared by wider groups, and ultimately resided in the ordinary citizen in the leading cities of the Greek world. In the same general period, Rome developed a constitutional system which, while less radically democratic than that of Greece, was better able to perpetuate itself. Political ideas from the two peoples, gaining prestige with the Roman conquest of Greece and most of the rest of the then known world, established the forms and much of the vocabulary of government which prevails today.

Actually, there was an "iron-age" interlude between the period of Greco-Roman political thought and practice and that of the modern world. The Roman empire was succeeded by over a thousand years of a resurgent feudalism, which in turn was succeeded by a period of absolute monarchies. Cities again grew up, and the earlier evolution from absolutism to democracy was essentially repeated in Europe from the 16th to the 19th century.

As intimated above, our language of government is dominated by words which have come down from Greece and Rome. From Greece, for example, we have the terms monarchy (rule by one person), aristocracy (rule by the upper class), and democracy (rule by the common people). From Rome the terms republic (rule by elected officials under constitutional forms), empire (wide-spread control through military strength), and senate (legislative body originally of more experienced citizens).

Realities Behind the Forms. In seeking to understand the nature of the government of any country, it is necessary to look behind the terms used to describe them. There are several reasons for this.

First, many governments have evolved from one type to another without changing the language describing them. For example, Great Britain and Sweden are monarchies, but real control lies, not with the monarch, but with the ordinary citizen; these countries are no less democratic than many other democracies and much more so than many governments which are called democracies.

Second, many so-called democracies are so designated because of what their leaders hope they will become rather than because of what they are. For example, some newly independent African countries call themselves democratic republics even though they may still be ruled by an oligarchy of tribal chieftains or by a dictator. In practice, their ruler may ignore the constitutional forms which were based on ideas learned from democratic European states or from the United States of America.

Third, the 20th century has witnessed the rise of a number of governments which have democratic republican constitutions but which operate their institutions by means of one party, and the party is governed by rules entirely outside the constitution. This party manipulates the institutions so that the ordinary citizen has no effective choice in selecting his rulers. Russia and China are outstanding examples.

It thus appears that, while the constitutions are the forms of government, the way a nation is actually governed depends on the experience and character of the people who rule and are ruled. A people which, over a long period of time, has developed the habit of individual liberty tempered by self-restraint in respecting the liberty of fellow citizens can govern itself well even under a constitution which does not guarantee civil rights, whereas a people without such a habit of liberty is apt to be governed tyrannically despite an elaborate bill of rights in its constitution. Canada, for example, has no bill of rights in its fundamental law, apparently not having felt the need for a formal guarantee of what was customarily enjoyed. A recent law corrects the oversight. On the other hand, the Russian constitution has an elaborate bill of rights, which serves as a hope rather than a reality.

It may be said that, at best, constitutions show the legal framework within which a country is actually governed and that, at worst, they set up a legal standard which hopefully may some day be attained.

Present-Day Status of Nations. The 20th century has witnessed a vast expansion in the number of independent nations. In 1907, 48 states were invited to send representatives to the Second Hague Conference, and this was considered the number of the "family of nations" at that time. The number of nations was increased by World War I. Following World War II, there were, in 1951, 60 members of the United Nations, with over a dozen others awaiting admission or which chose not to be members. The next two decades saw an unexampled proliferation of states as the peoples of Asia and Africa threw off the political yoke of their former masters.

This section contains accounts of the governments of more than one hundred states. Three of these states have two governments each—China, Germany, and Korea—and each claims that it alone is able to represent the entire country. A description of both governments is given in each such case. Summaries indicate the time and manner in which each state became independent and set forth the main points in its formal framework of government based on an examination of the constitution. Where the realities of government differ markedly from its form, this also is indicated. The reader is enabled thereby to understand better the day-to-day political happenings in these states, the importance of which, in today's closely knit world, readily overleaps national boundaries and affects the interests of all.

AFGHANISTAN

Government

From the time it was unified by invaders from Iran in the 18th century, Afghanistan was a kingdom. In 1922 a constitution added a parliament consisting of a senate and a national assembly, both with limited powers. The constitution of 1965 established the full constitutional monarchy. Then, in 1973, a coup by the army deposed the king. A military committee declared a republic and elected its leader president. In the absence of a constitution, government was by presidential decree.

Afghanistan forms a mountain barrier between Russia and India. Invaders such as Alexander the Great and Tamurlane crossed the region to conquer India. The defense of the Khyber Pass, called the gateway to Asia, was long regarded as the major task of Indian and British armies.

Following wars in 1839 and 1842, British-Afghan relations were governed by treaty. The war of 1880 led to British control of Afghan foreign relations. British and Russian rival interests were adjusted in 1907 by a treaty that also defined their interests in Iran and Tibet. In 1918 the treaty was denounced by the Soviet regime. A British mission then effected a treaty in 1921 restoring British predominance. After World War II and the independence of India, Afghanistan followed a neutral policy between the conflicting interests of the East and West.

ALBANIA

Ruled for 450 years by the Turks, Albania was set up as an independent state in 1912 but was conquered by Italy and Germany in World War II. On their defeat, Albania again became independent in 1945, when the Albanian Labor Party, a branch of the Communist party, established Albania as a people's republic. The ruling body both of the state and the party is the Politburo, with 11 full members and 4 candidate members. In addition, there is a People's Assembly of deputies, one for each 8000 inhabitants, elected for 4-year terms, the candidates are selected by the party. In the rift between Russia and China in the 1960s, Albania sided with China.

ALGERIA

After 132 years of French rule, Algeria became an independent republic in July 1962. A national assembly met in September and elected Ferhat Abbas president and Ben Bella prime minister. A constitution was issued in 1963. It provided for a one-party (the National Liberation Front) government. Also in 1963, a national assembly was elected for 5 years by universal vote, with candidates designated by the National Liberation Front. The party also designated a candidate for president of the republic, to be elected by popular vote. The assembly, led by its president and cabinet, was to pass legislation. If the assembly censured the policy of the president of the republic, the assembly's president could take over the latter's duties. In the 1963 national elections, Ben Bella, the sole candidate, was elected president of the Democratic People's Republic of Algeria.

In 1965 a military coup, led by Col. Houari Boumedienne, overthrew the government and set up a revolutionary council with Boumedienne as the head. The constitution of 1963 was suspended.

A new constitution, approved in 1976, provided for a national assembly to be elected every five years and a president with a renewable six-year term. The president would be head of state, commander in chief of the armed forces, and head of national defense and would have the authority to appoint a vice president and prime minister.

Boumedienne was reelected in 1976 and a 261-member national assembly was elected in 1977.

ANDORRA

A small, neutral "republic" on the Franco-Spanish frontier. It is a surviving specimen of the semi-independence of feudal lordship, possessed in medieval times by many valleys of these mountains. It is governed by a council of 24 members elected for 4 years by men over 25 years old. A first and a second "syndic" are chosen by the council as presiding officers and executives of the republic. The state is under the joint suzerainty of the Spanish bishop of Urgel and the president of France, as successor to the Bourbon kings. Andorra pays nominal tribute to France and to the bishop.

ANGOLA

Angola is an independent country—bounded by Zaire, Zambia, and South West Africa—on the Atlantic coast in the Congo region. The area was discovered in 1482 and was the site of the first European colonies in Africa. The Portuguese settled the region in 1491 and founded Luanda as their main city in 1575. Portuguese rule continued for nearly five centuries. The spread of black African nationalism led to guerrilla warfare in Angola in 1961. Facing its own internal problems, Portugal declared Angola autonomous in 1972, but the fighting there continued through the revolution in Portugal in 1974. On January 15, 1975, the three competing Angolan liberation groups signed an agreement under which Angola, the last major European colony in Africa, would gain independence on November 11. Terms calling for a temporary coalition in Luanda proved ineffective as civil war raged in 1975 among the rival factions. Two distinct governments were formed. In Luanda, the Popular Movement declared its leader, Agostinho Neto, president. The other two factions, the National Front and the Union for Independence, announced their own joint government. With Soviet aid and troops from Cuba, Neto's group assumed military control. On February 11, 1976, the People's Republic of Angola under Neto was admitted to the Organization of African Unity as its 47th member. Other countries, including the nine nations of the European Community, also recognized Neto's government. Yet with internal problems and wide unrest, guerrilla warfare in the new nation continued.

ARGENTINA

Argentina arose out of the Spanish viceroyalty of La Plata. In 1816 a congress at Tucuman proclaimed the Argentinian provinces an independent republic; but, the union was weak and years of anarchy followed. Juan Manuel de Rosas became dictator in 1835; he governed until 1852. The Argentine Republic was formed in 1853 and a constitution was issued. A new constitution was drafted in 1949 by the Peron government. Juan Peron had become president in 1946. He remained president until he was deposed in 1955. While in exile Peron maintained his influence in Argentina, and in 1973 he was reelected president, with his wife as vice president. Isabel Peron became president after her husband's death in 1974. She was deposed in 1976 by a military junta, and Jorge Rafael Videla assumed the presidency.

The present constitution, adopted in 1957, follows generally the liberal constitution of 1853 but gives the central government greater control over the economy. It resembles the constitution of the U.S., particularly in its union of the provinces of the country into a federal republic. These provinces are 22, besides one federal district, Buenos Aires. The provinces, like the American states, elect their own legislatures and governors and have jurisdiction over provincial affairs. Powers not granted to the nation are retained by the prov-

inces, but the federal government has more powers than those granted by the U.S. constitution.

Executive Organization. Under the theory of separation of powers, the federal government is divided into executive, legislative, and judicial departments. Executive authority is conferred on a president, who occupies the position of an independent executive.

In addition to the usual powers of an American executive, the president of Argentina makes all appointments to federal offices without the limitation of senatorial confirmation, except in the appointment of magistrates of courts, diplomatic representatives, and higher officers of the army, where the advice and consent of the senate are required.

The Congress. The federal legislative authority is vested in a congress composed of a senate and a chamber of deputies, which meet in regular session annually beginning on May 1. The 46 senators are elected by the legislatures of the 22 provinces and by a special body of electors in the federal district.

Deputies are elected by the people in electoral districts of 85,000 inhabitants or a major fraction thereof each, with a minimum of 2 for each province. The term is 4 years, half of the chamber being renewed every 2 years.

AUSTRALIA

By the end of World War II Australia had become an economically successful industrialized nation, with a greater importance in international relations. The Labor government, in power from 1941 to 1949, had enacted broad welfare legislation. The population had increased more than 60 per cent since the war, mostly through government-encouraged immigration. After 23 years of Liberal-Country government, marked chiefly by anti-Communist internal and foreign policies, together with a closer alliance with the U.S., the Labor party came to power again in 1972. Under Prime Minister Edward Gough Whitlam, the government ended the military draft, withdrew forces from Vietnam, established ties with Asian nations including Communist China, ended the death penalty, set the voting age at 18, and established representation for aborigines. However, inflation at 20 per cent a year, unemployment higher than in depression years, and government problems including cabinet-level scandals, brought Australia its worst crisis in history. In November 1975, the governor general removed Whitlam from office—the first time the crown had ever removed an elected prime minister. Whitlam was replaced by John Fraser, heading a Liberal-Country care-taker government. In the following December elections, Fraser won the greatest coalition majority in Australia's history.

AUSTRIA

Following World War I the dual monarchy of Austria-Hungary was dismembered by the Treaty of Versailles into Austria, Czechoslovakia, Hungary, and Yugoslavia. In 1918 Austria became a republic and continued as an independent state until forcibly annexed by the German Reich in 1938. After the liberation of Austria by the Allies in 1945, the republic was reestablished but, the country was under occupation by the United States, Britain, France, and the U.S.S.R. until May 1955.

Under its constitution of 1945, Austria is a federal republic with some features of a parliamentary democracy. The president is elected for a 6-year term by universal suffrage, voting being compulsory. He may serve a maximum of 2 terms. He appoints the chancellor and, with the latter's recommendations, the other ministers, who may not be members of the assembly. The national assembly is elected for a 4-year term by universal suffrage. The senate is chosen by the state legislatures by proportional representation as to parties.

AZORES

The Azores, an archipelago of 3 island groups, is in the North Atlantic Ocean approximately 900 miles west of Portugal. Under the constitution of 1832, the islands were grouped into 3 administrative districts, which were later granted limited autonomous administration. In the free elections for the Portuguese constituent assembly (April 25, 1975), Azoreans voted overwhelmingly for the Popular Democratic and Socialist parties, giving the Communists only 2 per cent of their vote. Resistance toward the leftist central government in Lisbon appeared soon after the Popular Democrats and Socialists withdrew from the Lisbon government. A small independence movement, the Azores Liberation Front (FLA), arose in opposition to a Communist takeover in Lisbon and announced the establishment of a government in exile. In August 1975, the Lisbon government established a governing commission (the general junta) for the entire archipelago. A transitional legislation was to be enacted until the constituent assembly in Lisbon could draft a new constitution. While the FLA and many Azoreans favored complete independence from Portugal, the Lisbon government planned to grant the islands greater regional autonomy with an elected assembly of deputies. Regional elections in the Azores were held on June 27, 1976, with the Popular Democrats, who supported broad autonomy, earning a decisive victory. Nevertheless, the newly appointed president of Portugal warned against the secessionist movement.

BAHAMAS

The Bahamas became independent in 1973, ending three centuries of British rule. Of the 700 islands in the group, 30 are populated. The capital is Nassau, on the island of New Providence. Under the new constitution, power rests in the prime minister, senate, and house of assembly. The Bahamas became the 33rd member of the Commonwealth of Nations and a member of the UN in 1973.

BAHRAIN

The Arab sheikhdom of Bahrain, an archipelago in the Persian Gulf, was long a British protectorate. This ended with a treaty of friendship with Britain in 1971. The Arab dynasty had been in power since 1782. A council of state was formed in 1970 to administer the country; the council was replaced in 1971 by a cabinet. In 1972 a constituent assembly drafted a constitution, which was issued the following year. A national assembly with a 4-year term met in 1974. The head of state is the hereditary emir, or sheikh. Bahrain joined the UN in 1971. Its largest city and capital is Manama.

BANGLADESH

This nation was formerly the eastern province of Pakistan. It achieved independence in 1971 and became known as the People's Republic of Bangladesh. Under the constitution of 1972 the president is directly elected for 5-year terms. The legislature is a one-chamber national assembly of 300 members directly elected for 5-year terms by citizens over 18. For the first 10 years of the republic 15 extra women members will be elected by parliament to the national assembly. The country has been under martial law since a coup in 1975.

BARBADOS

An island in the Caribbean, Barbados is an independent democracy within the Commonwealth.

The head of state is the sovereign of England, represented by a governor-general. The head of government is the prime minister. Parliament, a bicameral legislative body, has a house of assembly, with 24 members elected popularly for 5-year terms, and a senate of 21 members, 12 appointed by the governor-general on the prime minister's recommendation, 2 on the advice of the opposition, and 7 as representatives of various social and racial groups. Barbados became independent and joined the United Nations in 1966.

BELGIUM

In its present form, Belgium was established in 1830 under a guarantee of neutrality by Austria, Russia, Britain, and Prussia. By the constitution, leadership of the state is vested in the king. While the government is conducted by ministers responsible to Parliament, the king exerts large influence on national policy. He may convoke, prorogue, and dissolve Parliament. Parliament consists of a Chamber of Deputies and a Senate. The Chamber of Deputies is composed of 212 members but not more than one to each 40,000 population. They sit for 4 years.

The provinces, representing one-time separate principalities, have a considerable degree of autonomy which is recognized by the constitution. Each has a provincial assembly chosen by the qualified electorate. The head of the provincial administration is a governor, appointed by the king.

The real Belgian local autonomy, however, is expressed in the "communes," the towns. In the Belgian kingdom, there are some 2672 communes. They are governed according to a common plan and are under one municipal law.

The Belgian nation is composed of two distinct European peoples, the Flemish and the Walloons. The Flemish occupy the northern portion of Belgium; in speech (Flamand) and in physical appearance they are akin to the Dutch. The Walloons are a darker, less phlegmatic race who speak French.

BELIZE

Belize, formerly British Honduras, is located on the Caribbean coast of Central America, bordered by Mexico and Guatemala. A new constitution was drawn up in 1954, and a nationalist group came to power. The constitution of 1961 called for extended autonomy; full internal self-government was achieved on January 1, 1964. Universal suffrage was granted to those over 21. The colony has since pushed to achieve gradual independence from British rule. Unfortunately, increased border disputes with Guatemala, which claims the territory, have prevented Great Britain from granting Belize independence. On December 8, 1975, the UN General Assembly passed a resolution sponsored by Britain and some 60 other nations calling for Belize's right to self-determination and independence, and for the preservation of the colony's territorial integrity.

In 1970 Belmopan was built as the new capital and seat of government. The country's name was changed to Belize on June 1, 1973. The government consists of a 2-chamber national assembly with an 18-member house of representatives elected by universal adult vote and an appointed senate of 8 members. The cabinet is headed by the premier. The cabinet and premier, who exercise executive power, are responsible to the legislature, which can remove them through votes of no confidence. Cabinet ministers are members of the majority political party and hold seats in the national assembly concurrent with their cabinet posts. Elections are held at least every 5 years. A British crown-appointed governor is responsible for defense, foreign affairs, security, and civil service employment. Members of an independent judiciary also are appointed by the British crown.

BENIN (DAHOMEY)

Benin has been under French influence since the mid-19th century, as a kingdom and later as the French colony of Dahomey. Self-governing since 1958, it achieved full independence on August 1, 1960. Five military coups, interspersed with short-lived civilian regimes, followed. After the fifth coup, on October 26, 1972, Major Mathieu Kerekou established military control. He abolished the presidential council and the assembly. In December 1974 President Kerekou declared Dahomey a "Marxist-Lenin State," and began nationalizing banks, oil companies, and other businesses. On November 30, 1975, the name of the country was changed to Benin.

The president, assisted by a council of ministers, directs the country. A 67-member national council provides policy direction. The central government administers the country through department heads and prefects appointed by the president. The judicial system, based on the French code, is headed by a supreme court. Local courts administer either African tribal law or Moslem law. A member of the Organization of African Unity, Benin joined the UN in 1960.

BHUTAN

A constitutional monarchy since it gained independence in 1949, this Buddhist kingdom in the eastern Himalayas is guided in foreign relations by India. The king's subjects may dismiss him by a vote of no confidence, and he would be replaced by the next in line of royal succession. The king rules with 3 ministers and must maintain the confidence of the assembly, a unicameral body of 140–200 members nominated by the villages for 3-year terms.

BOLIVIA

The revolution against Spain was initiated 1809–10 in the territory of Bolivia, then known as Upper Peru. After independence in 1824, the Bolivians met with representatives of Argentina to determine whether or not they would join that country. They unanimously voted to remain a separate nation under the style of the "Republic of Bolivia," the name being taken from Simon Bolivar, liberator of South America. The independence of the republic was proclaimed on August 26, 1825. The territory claimed for the new republic was that which, under Spanish authority, was subject to the Audiencia of Charcas.

Bolivia has experienced many constitutional changes—1829, 1831, 1834, 1836 (a confederation with Peru, dissolved in 1839), 1841, 1843, 1851, 1861, 1880. In 1964 a constitution of 1961 was abrogated in favor of an earlier constitution of 1947. A new constitution was adopted in 1967. In 1969 military rule was established and the national congress dissolved. The country presently is being ruled by presidential decree.

BOTSWANA

The British protectorate of Bechuanaland became the independent African Republic of Botswana in 1966. A constitutional democracy, its chief of state is the president, who also is chief executive and commander-in-chief of the armed forces. The present constitution, effective as of 1965, provides for a national assembly of 36 members—32 elected directly, 4 appointed by the president and attorney general. An advisory house of chiefs consists of 8 principal chiefs and 4 subchiefs. Botswana is a member of the British Commonwealth.

BRAZIL

The United States of Brazil is a federal republic, comparable in area to the U.S. It was a dependency of Portugal from the time of its discovery in 1500 until 1822, except for a period of 60 years, 1581–1640, during which Portugal was united to Spain.

Brazil was the seat of the Portuguese government and the residence of the royal family from 1807 to 1821. On the return of the Portuguese royal family to Portugal, a national congress assembled in Brazil and chose Pedro, the king's son, as "Perpetual Defender of Brazil." In the same year, Pedro proclaimed the independence of Brazil and was chosen constitutional emperor. Brazil remained an empire until 1889, when Pedro II was dethroned and the imperial family was exiled. The decree of banishment against the family was repealed August 6, 1920.

The Republic. A republican constitution bearing a close resemblance to the U.S. Constitution was adopted in 1891. It was in effect until 1930, when the union was saved at the cost of civil war. A new constitution was adopted in 1934, the chief alteration being the large powers granted to the federal government to control economic activities. These powers included the right to regulate industry, to nationalize banks and insurance companies, and to take over any industry, subject to payment of compensation. The constitution was altered again for greater centralization in 1937 and in 1946. A revision of the constitution in 1969 granted the president almost absolute power.

The union is divided into 22 states, a federal district, and 4 federal territories. Each state is self-governing with its own constitution, legislature, and judicial system.

By the constitution of 1969, the president and vice-president are elected to 5-year terms by an electoral college of members from the national congress and delegates from the state legislatures. The president appoints state governors and city mayors. Under the "institutional act" written into the 1969 constitution, the president may revoke the rights of citizens and recess congress.

There are 17 departments of government: agriculture, air, army, communications, education, finance, foreign affairs, health, industry and commerce, interior, justice, labor, mines and energy, navy, transportation and public works, and welfare and social security.

The legislative branch consists of a senate and a chamber of deputies, both of which are elected by compulsory vote of literate citizens over 18. The senate has 66 members—3 from each state, elected to 8-year terms. The chamber of deputies is composed of 1 deputy for each 300,000 inhabitants, with a minimum of 7 per state and 1 per territory. They are elected to 4-year terms.

The judicial system consists of a supreme court, whose justices are appointed by the president and approved by the Senate; federal courts; federal courts of appeal; and special courts which handle military, labor, and electoral cases. The state judicial system resembles the federal system.

Frontier Settlements. The frontiers of Brazil adjoin the territory of every other South American state except Ecuador and Chile. Boundary disputes with the Guianas were settled by negotiation and arbitration in 1901, 1904, and 1906.

The boundary between Brazil and Venezuela was settled in 1905, after a long period of negotiations, and the demarcation was made by a mixed commission in 1914. In 1872, Brazil and Paraguay signed a treaty whereby the title to Brazilian territory north of the Rio Apa was determined. The boundary with Argentina was settled by an arbitral decision by the president of the United States in 1895. The Brazilian contention was sustained. A remaining boundary difficulty between Brazil, Peru, and Colombia was settled by agreement at Washington, March 4, 1925.

In boundary negotiations with Uruguay, Brazil, by a treaty of 1851, secured rich territory that, by a treaty of 1777, had been admitted to belong to Spain. In this case, as in others, Brazil was able to acquire territories beyond those fixed during the period of Spanish domination. Thus, by means of a series of remarkable negotiations and awards, there was ended the long competition between Spain and Portugal that began in 1493, when the bull of Pope Alexander divided between those two countries the discovery and the conquest of the world.

BULGARIA

Bulgaria, long a subject territory of Turkey, obtained autonomy in 1878 by the Treaty of Berlin, which ended the Russo-Turkish War. In 1885 Rumelia, the Bulgar-inhabited province south of the Balkan Mountains, obtained union with Bulgaria. In 1908, during a revolution in Istanbul, Bulgaria declared complete independence, and its reigning prince, Ferdinand, of the house of Saxe-Coburg-Gotha, proclaimed himself king of the Bulgarians. By the second Balkan War, 1913, Bulgaria lost territory to Rumania. In World War I it suffered further losses, but by treaty in 1924 regained an outlet to the Aegean. After World War II it retained the southern Dobruja, ceded by Rumania in 1940.

The first constitution of Bulgaria was adopted in 1879, and amended in 1893 and in 1911. At the end of World War II, Bulgaria, which had joined the Axis powers, was at the mercy of Russia. The monarchy was abolished by popular vote, and a constitutional convention set up a people's republic under a constitution of 1947.

A new constitution was adopted in 1971. Under it a single-chamber national assembly is elected to a 5-year term by direct universal vote of citizens over 18. All candidates, however, are nominated by the Fatherland Front, of which the executive body, or politburo, exercises the ultimate power in the state although it is not mentioned in the constitution. The assembly elects the council of state, which is the highest organ of the state.

BURMA

Under British influence or rule since about 1610, the Union of Burma became an independent republic in 1948 following a 1947 treaty with Britain. All ties with the British Commonwealth were severed.

A constitution was adopted providing for a president with a term of five years. The president was elected by the parliament, consisting of a chamber of deputies and a chamber of nationalities. The supreme court was the court of final appeal. Its members were appointed by the president with the approval of parliament.

Constitutional rule was suspended by the military during 1958–60 and again in 1962. General Ne Win overthrew the elected government of U Nu, replacing it with a revolutionary council. The parliament and state councils were dissolved. A new constitution was approved by referendum in 1973. Military control was ended in 1974 and Burma became a single-party socialist republic. Elections to the new people's assembly were held and Ne Win became president. The assembly then elected a council of ministers for foreign and national affairs.

BURUNDI

German military occupation ended in Burundi in 1919 when Burundi became part of the UN territory Ruanda-Urundi administered by Belgium. Burundi was granted independence in 1962, and in 1966, following 51 years of monarch rule, Burundi was declared a republic. In 1974 the country's first constitution was approved. Its provisions include a one-party system. The party defines and controls the actions of the government and judiciary. The party's leader, the secretary-general, is elected by the absolute majority of the party's national congress. He is president and prime minister for a renewable 7-year term. The president appoints and dismisses ministers and defines their duties. Legislative power is vested in the president; all members of government are responsible to him. The president also is commander of the armed forces. The social and economic development of the republic and its citizens is controlled by the government.

Burundi is bounded on the east and southeast by Tanzania, on the north by Rwanda, on the west by Zaire, and on the southwest by Lake Tanganyika.

CAMBODIA

Cambodia was under French rule and protection from 1863 until 1953, when a constitutional monarchy led by Prince Sihanouk was formed. Growing civil strife was fed by economic difficulties, Communist guerrilla infiltration, and increasing involvement with the Vietnam war. In 1970 Sihanouk was deposed in a bloodless coup by pro-Western General Lon Nol; the Kingdom of Cambodia became the Khmer Republic under a new constitution. The next five years were marked by intensified insurgent activity by the Khmer Rouge (Communist-supported) factions led by Khieu Samphan and joined by pro-nationalist supporters of Sihanouk. The Khmer Republic fell and Lon Nol fled in April 1975. The Khmer Rouge, using Sihanouk as titular head, approved a new constitution in late 1975 and held a national election in March 1976, forming a 250-member national congress. Kieu Samphan was named chief of state. Despite the constitutional election, Cambodia has been listed among the "not free" nations of the world.

CAMEROON

This republic is a federation dating from 1961, formed by two provinces, East Cameroon and West Cameroon. In 1972, by national referendum, the United Republic of Cameroon was proclaimed.

The constitution provides for a president as head of state. The president is assisted by a cabinet of 24 ministers and 4 deputy ministers. The 120-member national assembly consists of representatives from East Cameroon and from West Cameroon. The first federal elections took place in 1964. The president is nominated by a congress of the republic's only political party and is elected for a 5-year term. In 1975 the position of a prime minister responsible to the president was established. In 1976 Cameroon was described as "partly free."

CANADA

Canada was originally a French settlement ceded to England in 1763. The portion colonized by the French, known as Lower Canada, and Ontario, or Upper Canada, which was inhabited by British settlers, were united in 1867 with two other British colonies—Nova Scotia and New Brunswick—to form the Dominion of Canada. To this union were subsequently admitted, as provinces of the federation, Manitoba (1870), British Columbia (1871), Prince Edward Island (1873), Alberta and Saskatchewan (1905), and Newfoundland (1949). The Yukon and Northwest Territories are governed by commissioners appointed by the federal government.

The early British colonial policy in America was to reserve executive power to a proprietary, or royal, governor, while granting local legislative power to a representative assembly. The laws of the colonies were subject to the approval of the governor and of the home government. After the separation of the colonies composing the United States, the desire for self-government in Canada led to continuous difficulty with the royal governors and even to local rebellion. In 1838, when political relations in Canada had reached a deadlock, the British government sent out a commission of inquiry headed by Lord Durham, who recommended the recognition of self-government in the Canadian colonies and the formation, in each colony, of a ministry that would be politically responsible for the legislature and not to the British government. This principle was adopted. The governor, or representative appointed by the British crown, became the nominal representative of imperial authority, while a "premier" responsible to the local Parliament became the actual head of government.

When 4 colonies confederated in 1867, a form of government was established by the British North America act, which, with many amendments, forms the basis of the Canadian constitution. The constitution does not exist as a formal document. It includes much which is not in the original act and its amendments, such as the role of the cabinet based on custom and a bill of rights, adopted by the Canadian Parliament as a law in 1960. The most important amendment of the basic British act was the Westminster statute of 1931, which provides that the British Parliament may not legislate for Canada except on the specific authorization of the Canadian Parliament. A law of 1947 created Canadian citizenship; previously Canadians had been known as British subjects. Queen Elizabeth II of Great Britain was declared queen of Canada by Canadian law.

Federal and Provincial Powers. The following subjects are specifically enumerated as reserved to the national Parliament:

Amendment of the constitution, except regarding legislative authority of the provinces, schools, use of French and English languages, and duration of Parliament.
The public debt and property.
The regulation of trade and commerce.
The raising of money by any mode or system of taxation.
The borrowing of money on the public credit.
Postal service.
The census statistics.
Militia, military and naval service, and defense.
The fixing of, and providing for, the salaries and allowances of civil and other officers of the government of Canada.
Beacons, buoys, lighthouses, and Sable Island.
Navigation and shipping.
Quarantine, and the establishment and maintenance of marine hospitals.
Seacoast and inland fisheries.
Ferries between a province and any British or foreign country, or between two provinces.
Currency and coinage.
Banking, incorporation of banks, and the issue of paper money.
Savings banks.
Weights and measures.
Bills of exchange and promissory notes.
Interest.
Legal tender.
Bankruptcy and insolvency.
Patents of invention and discovery.
Copyrights.
Indians and lands reserved for the Indians.
Naturalization and aliens.
Marriage and divorce.
The criminal law, except the constitution of courts of criminal jurisdiction, but including the procedure in criminal matters.
The establishment, maintenance, and management of penitentiaries.
Such classes of subjects as are expressly reserved from the provincial legislatures.

The powers expressly bestowed upon the provincial legislatures are as follows:

The amendment of the provincial constitution, except as regards the office of the lieutenant governor.
Direct taxation for provincial purposes.
Borrowing of money on sole credit of the province.
The organization of the provincial administration.
The management or sale of provincial lands.
Reformatory prisons.
Hospitals, asylums, and charitable institutions other than marine hospitals.
Municipal institutions.
Local excises.
Provincial works, including railways, canals, telegraph systems, shipping lines.
The incorporation of stock companies.
Solemnization of marriage.
Definition of property and civil rights within the province.
Administration of justice, including provincial courts.
Imposition of punishments for enforcing provincial laws.
In general, all matters of a merely local nature.

Both the federal and provincial governments may legislate on immigration, education, and social welfare. However, an attempt to restrict oriental immigration by British Columbia was invalidated by the national government. The organic law permits the provinces to conduct education but provides also for protection of the educational rights of minorities in the different provinces.

Governor-General. The crown is represented in Canada by a governor-general, a Canadian citizen chosen by the crown on the advice of the prime minister. Originally, the governor-general was assisted by a privy council, chosen from the royal family, former prime ministers and other high officials, and the current cabinet. The privy council, however, never meets but its function is carried on by the cabinet, which is responsible to the House of Commons. The term of the governor-general is not fixed but usually lasts from 4 to 7 years.

Parliament. The federal Parliament consists of two houses—a Senate and a House of Commons. A senator must be at least 30 years of age, a natural born or naturalized Canadian subject, possess at least $4,000 in excess of liabilities, be a resident of the province for which he is appointed, and, in the case of Quebec, he must either be a resident of the district which he represents or hold the qualifying amount of real property therein. Senators are nominated for life by the governor-general, but their actual selection rests with the Canadian prime minister. The Senate consists of 104 members, 24 from Ontario, 24 from Quebec, 10 from Nova Scotia, 10 from New Brunswick, 4 from Prince Edward Island, 1 from the Yukon Territory, 1 from the Northwest Territories and 6 from each of the following: Manitoba, British Columbia, Alberta, Saskatchewan, Newfoundland. The total number may not exceed 104.

The House of Commons consists of 264 members elected by universal suffrage from the provinces roughly in proportion to their populations. Its term is 5 years unless it is dissolved earlier. When it first meets, the leader of the dominant party assumes the office of prime minister, while the leader of the other or next strongest party is the leader of the opposition. The prime minister chooses a cabinet of 15 to 30 ministers, practically always from the House but not necessarily so. If the prime minister is defeated on a crucial issue in the House, he may resign or advise the governor-general to dissolve the House. The governor-general may persuade him or the leader of another party to attempt to form a cabinet having the confidence of the House, or he may dissolve the House and call for a new election.

Legislation. Bills originate in either house, except finance bills, which may originate only in the House of Commons. The Senate may reject a finance bill but not amend it. Most bills are initiated by the House. While the position of a senator is a highly privileged one, senators have never played a political role comparable to that of the members of the House of Commons and are seldom offered seats in the cabinet.

Courts. Judges in Canada are appointed and paid by the federal government to hold office for life or during good behavior. The supreme court of Canada receives appeals from the provincial courts and questions may be referred to it by the governor-general in council. A ruling may thereby be obtained on the constitutionality of any law without the delay and expense of litigation. Judgments of the supreme court are final. Policing powers throughout the entire nation are in the hands of the Royal Canadian Mounted Police.

Provincial Governments. The powers of provincial governments have already been noted. Each of the nine provinces has its own parliament and administration. With the exception of Quebec, the legislature consists of a single chamber. A lieutenant governor, appointed by the governor-general, represents the federal union, but actual government is in the hands of a premier and provincial ministers responsible to the provincial parliament.

CAPE VERDE ISLANDS

The Cape Verde Islands, an independent island republic, is an archipelago of 10 islands and 5 islets in the Atlantic Ocean some 400 miles west of Africa. The former Portuguese colony was made an overseas province in 1951. During the 1960s nationalist movements opposed Portuguese control. Following continued fighting and demonstrations, Portugal promised to grant Cape Verde independence. A transitional government was established on December 30, 1974.

The Cape Verde Islands became independent on July 5, 1975, ending over 500 years of Portuguese rule. The newly elected national assembly, which was to write the nation's constitution, chose a president and premier for the parliamentary republic. The U.S. extended recognition to Africa's 44th independent nation. Cape Verde established diplomatic relations with the U.S.S.R. and China; became a member of the Organization of African Unity on July 18, 1975; and was granted full membership to the UN General Assembly on September 16, 1975.

CENTRAL AFRICAN EMPIRE

This country was organized by France as a territory in 1894 and became an independent republic in 1960, remaining within the French Community. In December 1976 Jean-Bedel Bokassa, president-for-life, declared that the republic would become an empire ruled by a parliamentary monarchy, and that he would be known as Emperor Bokassa I. The Central African Empire is a member of the UN.

CHAD

Chad was part of French Equatorial Africa until 1960 when it became an independent republic, remaining within the French Community. Relations with France, however, have been strained. Chad did not attend the three French-African conferences (1973, 1974, 1975) and, in October 1975, following an order from the Chadian government, French troops were removed. The withdrawal ended 78 years of French military presence in Chad. In April 1975 President Tombalbaye was killed during a military coup. The constitution was suspended and the civilian government replaced by a nine-member military council with a president (Felix Malloum) and a vice president. The council established four commissions to supervise all government functions. The commissions covered control of financial matters, revision of the statutes of public service, economic and social services, and a military commission. There was an assassination attempt on President Malloum in 1976 on the first anniversary of the coup.

Chad was admitted to the UN in 1960. It is in northern Africa, bordered by Libya, Sudan, the

Central African Republic, Cameroon, Nigeria, and Niger.

CHILE

The republic of Chile arose from the Spanish captaincy-general of the same name. On September 18, 1810, the inhabitants of Chile deposed the Spanish authorities and created a provisional government. The Spanish fought to retain this province, and it was not until 1818 that Chile became free.

The Chilean constitution of 1833 was long the oldest constitution in force in South America. For decades a stable and effective government was maintained through the active participation in politics of an upper class strongly united by family associations. A new constitution came into effect in 1925, substantially altering the form of government and tending to vest more power in the president of the republic. The chief executive was elected by direct popular vote. Under the constitution of 1925 legislative power was vested in the congress, composed of a senate and a chamber of deputies.

After a military takeover in 1973, the national congress was dissolved although the constitution of 1925 is still basically in effect.

CHINA

Politically there are two Chinas—Mainland China, calling itself a people's republic, and the National Republic of China, occupying the island of Formosa (Taiwan).

China is the oldest political society in the world. The last imperial dynasty ruled from 1644 to 1911. Its emperors followed a policy of isolation from the rest of the world. They governed from Peking through a bureaucracy recruited through a competitive examination system, the governor of each province, while having wide powers, being subject to transfer or demotion at the word of the emperor. Within each province, authority was confided principally to direct magistrates, beneath whom the ancient social and family-oriented life of town and farming village functioned with a minimum of interference and with a maximum of individual freedom. Society was essentially democratic, there being no aristocracy beyond a few Manchu nobles and no privileged class except educated officialdom open to all. Caste was nonexistent.

This society was ill prepared to cope with a world in which isolation was no longer possible. The inexorable pressure of traders backed by governments with radically superior weapons forced concession of territories. The ferment of western ideas undermined the traditional bases of Chinese society. The dynasty fell and was succeeded in 1912 by a republic unable to function in the ensuing chaos created by rival "war lords," who were provincial governors maneuvering for power. In 1928, under the leadership of Chiang Kai-shek, the *Kuomintang* ("Nationalist party") established a government at Nanking. It was essentially a party government, in which the central executive committee of the party appointed the members of five councils to carry on the government. Three of these councils administered respectively the executive, legislative, and judicial functions. A fourth determined qualifications for holding public office, and the fifth exercised powers of impeachment and auditing. The head of the party was the president of the republic and commander of the army.

Russian trained Communists had controlled the party until Chiang Kai-shek expelled them by a bloody purge in 1927. But they continued to oppose the government, which was beset also by Japanese aggression before and during World War II. The Communists, under the leadership of Mao Tse-tung, obtained control of 5 northern provinces and, by dint of arms and promises of economic reforms, succeeded by 1949 in driving the nationalist government to Formosa, where its independence was protected by the United States.

The people's republic of China was proclaimed in September 1949. Mao Tsē-tung, who had been the authoritative leader and theoretician of the Communist movement since 1938, was elected chairman of the new central committee. Mao began a program against corruption, waste, and bureaucracy. He issued a five-year plan providing for large-scale industrialization and collectivization of agriculture. A reign of terror against landlords and Kuomintang officials existed for several years. Under the constitution of 1954 Mao became the chairman of the people's republic of China and of the national defense council.

By 1956 about 83 per cent of all Chinese peasants were on collective farms. Mao had recognized as early as 1925 the potential role of the peasant in a cultural revolution. The farms were economic institutions under county administration. Economic conditions, however, did not improve—by 1957 there was so much criticism of the government's economic policies that Mao had to impose police rule. In 1958 he established communes under party control.

By his own request Mao was not reelected head of state in the 1959 elections, but he remained the government's chief policy planner and chairman of the Chinese Communist party. In 1966 Mao began an intense campaign (the Great Proletarian Cultural Revolution) to impose upon the people of China a disciplined society, under complete control of the party. He put a tight grip on art, literature, and culture, ending individual creativity. Mao taught the Chinese to be committed totally to the revolution and to China. He strongly opposed anyone with capitalist ideas. The revolution, which was marked by violence, ended in 1969 and was followed by a period of moderation.

Mao died in September 1976. Although he was not considered a great administrator, he was China's greatest leader. He had installed in the Chinese people a sense of pride and purpose, and he had helped to make China an emerging superpower.

Mao Tse-tung was one of the 12 founding members of the Chinese Communist party. Another member of this group, Chou En-lai, had become China's premier and minister of foreign affairs. He was Mao's chief of staff. He administered the government and tried to balance the party's two factions—the radicals and the moderates (pragmatists). He brought order to the economy after the cultural revolution of 1966, and he was the Chinese official responsible for reconciliation between the U.S. and China. Chou died in January 1976.

Communist China. Under a constitution adopted in 1954, the National People's Congress is the highest organ of state authority. It is composed of deputies elected for a 4-year term by provinces (one deputy for each 800,000 population), by cities directly under federal authority (one for each 100,000), by national minorities (150 deputies), by the armed forces (60 deputies), and by overseas Chinese (30 deputies). It has a permanent standing committee, which convenes the Congress, conducts elections, interprets the laws, adopts decrees, and supervises the work of the government, or state council. The highest judicial organ is the supreme people's court. The people's procurator-general's office has the responsibility of seeing that the laws are strictly observed by government institutions and officials. All judges serve for 4-year terms. The Congress may be regarded as mere democratic trappings, since real power resides in the party. The constitution of the party is secret, but control over the personnel and action of the various governmental bodies is complete.

The constitution provides for state ownership of the means of production but recognizes also co-

operative ownership by workers, individual ownership, and capitalist ownership, the latter two being temporary until absorbed by collective or co-operative ownership.

Nationalist China. Like that of Communist China, the government of Nationalist China is a one-party system. The president, elected for a 6 year term, is the head of the party. There are also a vice president and a prime minister. The government claims rule not merely over the island of Formosa, to which its effective authority is confined, but over all of China, whereas Communist China considers Formosa as one of its provinces. The administration of island affairs is in the hands of a governor, whereas the national government controls the army.

Nationalist China, unlike Communist China, encourages private ownership of property on a wide basis. Its program for developing small independent farms stands out as a conspicuous success and resulted in rapid increase in food production. The government invests directly in the development of industry.

COLOMBIA

Upon the revolt of Spanish America from Spain, a republic was formed by the union of the "viceroyalty" of New Granada, the "captaincy-general" of Venezuela, and the "presidency" of Quito. This united state was called Great Colombia, and a government was formed, based upon a constitution adopted in 1821. Venezuela withdrew from this state in 1829, forming a separate republic, and Ecuador seceded in 1830. The remaining territory reorganized as the Republic of New Granada, with a constitution adopted February 29, 1832. A new constitution was formed in 1843 and another in 1853. The constitution of 1858 transformed the former centralized government into a federal form, composed of 8 states, styled the "Granadan Confederation."

Colombia remained a federal republic modeled upon that of the United States, with a corresponding measure of independent authority accorded to the 8 states of which it was composed, until the revolution of 1885. This brought about a new centralized government designated by the constitution of August 4, 1886, as "The Republic of Colombia." This act is the basis of the present fundamental law. By this constitution, the independence of the states was suppressed and they were transformed into "departments," with governors appointed by the president of the republic. The state of Panama protested against this suppression of its sovereignty, which action later became a ground for the justification of secession. Colombia is an example of a state (New Zealand being a second) which, having experimented with the federal principle, returned to centralized government. In the case of Colombia, it may be said that federation was not based, like that of the United States or Switzerland, upon a former independence of political units.

Balanced Parties. From 1953 to 1962, the government was controlled by the army. Thereafter the constitution of 1886 was reinstated with important modifications effective until 1974. While there is universal suffrage, the elections are so arranged that members of each of the two legislative bodies are equally divided between the Liberal party and the Conservative party. Presidents belonging to each of these parties must alternate in office.

The house of representatives consists of one member for each 90,000 inhabitants or a major fraction thereof. The senate has one member for each 190,000 inhabitants or a major fraction thereof. Each department elects an equal number of members of each party with an alternate for each member. If the rule respecting population results in an odd number of members from a department, one more is added. The terms are for 4 years. Senators are limited to those who have held certain high offices, university professors of 5 years' standing, and members of a profession requiring a university degree. While members of both houses may introduce bills, they are prepared by a council of state, members of which are chosen by congress from lists submitted by the president.

The president, elected for a 4-year term, appoints a cabinet, equally divided between the two parties. It is the channel of communication between him and congress. The cabinet may introduce legislation and advise him on approving or objecting to legislative acts. The president has a limited veto; he must promulgate a law repassed over his objection by both houses. The president appoints the governors of the departments (provinces). There is no vice president, but each two years congress elects a "designate" who assumes the duties of the president in the event of the latter's "absolute default." Such designate must belong to the same political party as the president.

Other provisions, all inserted into the constitution of 1886 in later years, include the following: Women shall have the same political rights as men, the minimum voting age for both being 21; the right to strike, except against the government, is guaranteed subject to regulatory laws; public aid is a function of the state; at least 10 per cent of the general budget of expenditures must be used for the support of public education.

Each of the 17 departments in which Colombia is divided is headed by a governor appointed by the central government and responsible to it. Each has also an elective assembly with power to regulate elementary and secondary education and charitable establishments, to regulate and encourage industry, and to deal with matters of land settlement, roads, and canals. Each elective assembly can create or abolish municipalities. The mayor of each municipality is the agent of the governor of the department. By this system of executive control, power is exerted in a highly centralized form with little participation by the individual citizen.

COMORO ISLANDS

A former French dependency, the Republic of the Comoros was established July 6, 1975. The French took possession of Mayotte in the Comoro Islands in 1843 and established a protectorate in 1886. The islands became a French colony in 1912 and a territory with representation in the French parliament in 1947. The present government was established in August 1975, after a coup in the capital city of Moroni. Governmental power is vested in a 12-member national executive council headed by the chief of state and the prime minister. Local government is conducted on each of the four main islands by district assemblies. Besides the supreme court of appeal, there are lower courts and 16 courts of Moslem law. Pending adoption of a constitution, legislative functions are performed by the national executive council. The Comoro Islands were admitted to the Organization of African Unity and to the UN in 1975.

CONGO (BRAZZAVILLE)

This country, becoming independent of France in 1958 but adhering to the French Community, established a republican form of government. A 1963 constitution provided for a national assembly elected by universal suffrage and a president chosen by an electoral college composed of members of the national assembly and regional and local legislative bodies.

Another constitution, adopted in 1973, was suspended in 1977. The national assembly was replaced by an 11-member military committee; local government was dissolved. The Congo has only one legal political party.

COSTA RICA

The population consists largely of descendants of white colonists. The present constitution, adopted in 1949, is a revision of the earlier constitution of 1871.

The legislative power is confided to a single body called the legislative assembly composed of deputies chosen for 4 years in the proportion of one for each 25,214 inhabitants. Voting is compulsory for all men under 70. All citizens are entitled to vote, the minimum age being 18 for married men and teachers, 20 for other men, and 21 for women. Deputies may not serve for consecutive terms. The state pays electoral expenses of political parties up to 2 per cent of the national budget. The assembly meets annually, on May 1, for a session of 60 days and may be called in extra session by the executive. In addition to possessing national legislative authority, the assembly appoints the justices of the supreme court, whose terms are for 8 years but are automatically renewed unless the assembly decides otherwise by a two-thirds majority. The assembly, moreover, may hear charges against the president and may order his trial before the supreme court of justice.

During the recess of the assembly, a "permanent commission" of five deputies continues in session, with the powers of interpreting laws in case of doubt, of preparing and putting in order unfinished business, of suspending the constitutional guarantees, and, at the request of the executive power, of passing urgent decrees. It may also be consulted by the executive on matters of importance.

The president and two vice presidents are elected for 4-year terms by universal suffrage. The candidate with the highest number of votes is elected, provided he polls at least 40 per cent of the vote. Otherwise a second election is held. The president appoints his ministers and, through them, may introduce bills in the assembly. He has a limited right of veto, which may be overridden by a two-thirds vote of the assembly.

The territory of Costa Rica is divided for administration into provinces, cantons, and districts. In each province are a governor, appointed by the president, and his agent. In the chief town of each canton is a municipal council with powers fixed by law. Under this somewhat conservative constitution, Costa Rica has enjoyed political stability.

CUBA

Cuba was the last of the Spanish dependencies in the Western Hemisphere to become independent and the only one in whose independence the U.S. played a role. By the Treaty of Paris, in 1898, Spain relinquished sovereignty over Cuba, then occupied by American forces, and the U.S. expressed its resolution to leave Cuba to the political control of the Cubans. Nevertheless, by act of Congress, the U.S. attached strings to Cuba's independence. (See *Platt Amendment.*)

A new constitution was adopted in 1940. It included provisions for a semiparliamentary government. When Batista seized power in 1952, he dissolved congress and the political parties; he was the only candidate in the election of 1954. Castro assumed the position of premier in 1959. He worked to establish a socialistic society and a government consisting of the Cuban Communist party and patterned after the Communist countries. At that time there were no elections. Rule was by decree issued by the premier. By such decrees, a program of collectivization was put into effect. Property of foreign corporations was confiscated, cattle and tobacco land was nationalized, and sugar and other agricultural land was turned over to cooperatives. Banks and industrial enterprises were nationalized. Castro declared allegiance to the Communist party in 1961; Russian, Chinese, and other Communist advisers were invited to assist in the collective reorganization of Cuba.

The first congress of the Cuban Communist party met in December 1975. Cuba's first five-year plan was introduced. A new constitution was drafted in 1975 and approved by a national referendum in February 1976. It proclaimed a socialist state and the Communist party the major force in Cuba. Elections are held every five years for members of the national assembly. The assembly elects a council of state which consists of a president, a first vice president, five vice presidents, and 24 other members. The council president is chief of state and head of the government. Assembly sessions are open to the public unless national interest is at stake. Legislation can be introduced by the state labor union, other mass organizations, or individuals with proposals signed by 10,000 citizens. Cubans also can exercise power through smaller popular assemblies. All citizens over 16 are eligible to vote. There is freedom of expression, religion, the press, speech, as long as the goals and principles of the government and society are not opposed. The state controls the press and communications.

CYPRUS

This republic, formerly a British crown colony, became independent in 1960 under an agreement (Zurich-London) by Britain, Greece, and Turkey following years of terrorism as one party favored union with Greece while the Turkish minority (about 20 per cent) opposed. The constitution reflects this division, Greek Christians versus Turkish Moslems.

It provides that the president has to be a Greek Cypriot, elected separately by his community, and the vice president a Turkish Cypriot, elected separately by his community. Both have veto powers over foreign affairs, security, and defense. Legislative power is exercised by the house of representatives, whose 50 members must be 35 Greeks and 15 Turks. This body has no jurisdiction over matters of religion, education, and other communal affairs. Such matters are dealt with by two separate bodies—a Greek communal chamber and a Turkish communal chamber. The members of the former are elected by Greek communes, those of the latter by Turkish communes. Each commune determines how many representatives it will send. Public employees must be in the approximate proportion of 70 Greek to 30 Turkish at all levels.

An attempt to amend the constitution in 1963 was resisted by the Turkish Cypriots and led to hostilities and intervention by the UN. Turkish Cypriots withdrew from the house of representatives in protest. In July 1974 Cypriot army insurgents led by Greeks staged a coup and overthrew President Makarios, who fled to Britain. He returned to the presidency in December. Later in July Turkish troops invaded Cyprus; Greek troops mobilized on the Greek border. The Turkish troops occupied 40 per cent of the northern part of Cyprus, forcing Greek Cypriots to move south as refugees. By UN resolutions attempts were made to have all foreign troops withdrawn from Cyprus. In February 1975, a Turkish Cypriot Federated State was proclaimed in northern Cyprus. Makarios' death in 1977 added another crisis to the unrest in Cyprus as hostilities continued. Cyprus is a member of the Commonwealth of Nations.

CZECHOSLOVAKIA

Czechoslovakia became an independent republic in 1918 upon the dismemberment of Austria-Hungary. Germany absorbed it in 1938–39. It was restored to independence in 1945 with close political and economic ties to Russia, with whose help Communist party members seized control of the government in 1948. A popular democratic constitution was adopted. In 1960 this was replaced by a new constitution on the Russian model declaring the country a socialist republic. It is described as a unitary state of two Slav nations, the Czechs and the Slovaks, possessing equal rights.

By 1968 there was a strong trend toward liberalization. The movement for political and economic reform brought the overthrow of the pro-Soviet leaders. Their place was taken by the reform group led by Alexander Dubcek. Within months U.S.S.R. troops forcibly occupied Czechoslovakia. Dubcek was ousted and a pro-Moscow leadership under Gustav Husak was established. In the process purges and trials were held and 50,000 fled abroad seeking asylum. By 1970 a 20-year treaty of friendship with the Soviets was signed.

In 1973–74 Czechoslovakia and West Germany signed an agreement that annulled the Munich Pact of 1938, which had given the Sudeten region to Nazi Germany. The event signaled closer ties with Western Europe, but also marked 25 years of Communist rule in Czechoslovakia.

In 1976 the main features of the 1960 constitution remained in effect. The federal assembly consisted of the dual chamber of nations (with 75 Czech and 75 Slovak delegates elected by their own national councils) and the chamber of the people, with 200 deputies elected by national vote of those over 18. The governing body is the presidium, or Communist politburo, under the party secretary general.

DENMARK

The three Scandinavian countries have at periods been united. In 1381 Denmark and Norway united under a common sovereign, separating in 1814.

Denmark is a limited monarchy. The present constitution, which is a modern version of the constitution of 1849, was signed June 5, 1953. By its terms the legislative power is vested jointly in the king (or queen) and parliament. The executive power is held by the king. He appoints the prime minister and presides over the cabinet, which handles new bills and important measures. Parliament consists of a single chamber composed of 179 members, 135 of whom are elected by proportional representation. An additional 40 seats are divided among the various political parties to equalize the representation. The Faroe Islands and Greenland, which have equal status with other parts of the kingdom, have 2 representatives each. Parliament is elected for 4 years and meets annually, but may be dissolved earlier by the king. Suffrage is universal; the voting age is 21.

The king can neither make war nor sign peace treaties without the consent of parliament. Under certain circumstances the constitution permits the transfer of some sovereign powers to international organizations, if approved by five-sixths of the parliament members or a plebiscite majority. Since 1953, women may succeed to the Danish throne.

There is a supreme court at Copenhagen, with a chief justice and 14 associates. The established church is the Evangelical Lutheran Church, of which the king must be a member. Its officers have no part in politics and dissenters have complete religious freedom.

Denmark is divided into 14 counties, each of which is subdivided into districts, and the districts are divided into parishes. Each urban municipality has a mayor and council.

DJIBOUTI

The Republic of Djibouti is located between Somali and Ethiopia at the southern entrance of the Red Sea. Formerly the Territory of the Afars and the Issas, a French colony for 115 years, Djibouti became independent in 1977 following a national independence referendum and assumed the name of its capital. A constituent assembly of 33 Issas and 30 Afars was chosen by a general election. The president of Djibouti named a premier, who appointed a cabinet. The new republic is a member of the Arab League, OAU, and UN.

DOMINICAN REPUBLIC

This country occupies the eastern section (approximately two-thirds) of the West Indian island Hispaniola. The western third of the island is the French-speaking Republic of Haiti. Hispaniola, discovered by Columbus in 1492, was part of the Spanish empire until 1795 when it fell under French rule. The eastern portion of the island eventually returned to Spanish rule and became independent in 1821. In 1844 the Dominican Republic was founded and a constitution approved. The country's first elections were held in December 1962. The following year a new constitution was proclaimed. After the civil war of 1965, the constitution was suspended and a provisional government with rule by decree was established. In November 1966 a new constitution was adopted.

It provides for a president elected by direct vote to a 4-year term. In case of death, disability, or resignation, the president is succeeded by the vice president. There are 12 secretaries of state, a judicial adviser with secretary-of-state rank, and 2 ministers in charge of departments. Citizens can vote at 18, or younger if they are married.

The Dominican Republic's history has been one of recurrent dictatorships, bankruptcy, and periodic financial and military intervention by the U.S.

ECUADOR

Ecuador, located in northwestern South America, is bounded by Colombia on the north, Peru on the east and south, and the Pacific Ocean on the west. The Galapagos Islands, 600 miles west of the mainland, are also part of Ecuador.

The territorial boundaries of Ecuador are still in part unsettled. In 1894, a three-party treaty, between Ecuador, Colombia, and Peru, was submitted for arbitration to the king of Spain. The congress of Ecuador, however, failed to ratify the treaty. In 1904, Ecuador and Peru again submitted their disputes to the king of Spain. A commission was appointed, but no award was given. A boundary treaty with Colombia was signed in 1916, and a delimitation of the frontier was completed in 1919 by a joint commission. In the Treaty of Rio in 1942, Peru was given over half of Ecuador's Amazonian territories after a conflict between the two countries. In 1961, Ecuador denounced this treaty and the issue remains unsettled.

Ecuador, founded by Spain, became a republic within the federation of Gran Colombia in 1822. Ecuador declared independence in 1830.

Ecuador has been plagued with government disorder. A military coup overthrew the government in 1963—a military junta was established and the 1946 constitution suspended. This junta was ousted in 1966 and a civilian government was formed. The following year a new constitution was adopted, and in 1968 elections for president and congress were held. The president assumed dictatorial powers in 1970. He was deposed in 1972 and another military government was established. In 1974 the government suspended all elections and political activity. A 3-man military junta took control of the government in 1976 and martial law was imposed. The military government announced that the country eventually would be returned to constitutional rule.

EGYPT

Government

The modern independence of Egypt dates from 1922 when England recognized the sovereignty of its former protectorate but retained certain defense rights and control of the Suez Canal. Under a treaty of alliance in 1936, these rights were to be relinquished in 1956; however, Egypt abrogated the treaty in 1951. Egypt was ruled as a limited monarchy from 1923 until 1952 when a military uprising compelled the king to abdicate; a republic was declared in 1953. In 1956, under the leadership of Nasser, a republican constitution was adopted by referendum, with Nasser as the first president. Later that year he seized the Suez Canal. From 1958 to 1961 Egypt was united with Syria and Yemen to form the United Arab Republic.

Under a new constitution issued in 1964, a national assembly is elected for a 5-year term by public secret ballot. One-half of the members must be workers or farmers; 10 may be appointed by the president. The president is nominated by the national assembly; the nominee's name is submitted to the electorate in a referendum. A majority of votes makes him president for a 6-year term. If he does not receive a majority, a new nominee is submitted. The president may appoint and remove one or more vice presidents. He also appoints the prime minister and other ministers who form the cabinet. The cabinet is the supreme executive and administrative organ of the state; it may submit bills to the general assembly. Bills, when passed, are subject to a limited veto by the president; a two-thirds majority in the assembly overrides the veto. The assembly may pass a vote of no confidence in any minister, in which case, the minister must submit his resignation. It is not stipulated that the president must accept the resignation. The president may dissolve the assembly and call for new elections. Islam is the religion of the state and the socialist system is its economic foundation. The constitution may be amended on proposal of one-third of the members of the general assembly if the proposal receives a two-thirds majority.

With the death of Nasser in 1970 and the naming of Anwar Sadat as president and military governor general, Egypt's foreign policy changed. Egypt expelled Russian advisers and began to negotiate with France and England. When President Nixon visited Egypt in 1974, diplomatic relations between the U.S. and Egypt were restored after a 7-year lapse. In 1975, Egypt reopened the Suez Canal and broke off a treaty of friendship with Russia. Egypt's move toward a more pro-West, anti-Communist stance was strengthened by the invitation of the U.S. to join the Middle East peace talks. Egypt's domestic problems continue to grow. Overpopulation, a floundering economy, and a 25 per cent yearly inflation rate have led to labor unrest—numerous riots have been reported between workers and the government.

EIRE

A 1921 treaty gave Ireland, exclusive of Ulster (Northern Ireland), the status of a free state in the Commonwealth of Nations. It became the Irish Free State in 1922 and was renamed Eire in 1937. Northern Ireland, which had been given a parliament in 1920, remained an integral part of the United Kingdom. Eire's charter of government established a republic with no organic link with Great Britain. Its parliament exercises jurisdiction in 26 of Ireland's 32 counties.

The legislature consists of 2 houses, the assembly (*Dail*) and senate (*Seanad*), which meet annually for a maximum term of 7 years. The senate consists of 60 members, 11 nominated by the prime minister, 6 elected by the universities, and the remaining 43 elected from 5 panels of candidates representing the following vocations: art and literature; agriculture and allied interests; labor, whether organized or not; industry, including banking and finance; and public administration and social services. Membership of the assembly is fixed by law from time to time subject to a rule that there shall be 1 member for each 20,000 to 30,000 of the population but at least 3 members from each constituency.

The president is elected for a 7-year term by direct vote of the people under a proportional representation plan. He must be an Irish citizen at least 35 years of age. Candidates for the presidency, except former presidents, must be nominated by at least 20 members of parliament (*Oireachtas*) or by not less than four county councils.

The president is assisted by a cabinet. Its 7 to 15 members must have been elected to parliament. Parliament selects the prime minister, who is head of the cabinet. The prime minister selects the other members, of whom the vice prime minister and those in charge of the department of finance must be members of the assembly.

A fourth governmental body, known as the council of state, is provided, its function being to give advice to the president. Members include the prime minister, the vice prime minister, chief justice, president of high court, chairman of the senate, ex-presidents, past incumbents of the first 3 of the posts named, and a maximum of 7 other members appointed by the president.

The president may, but is not required to, dissolve the assembly if the prime minister loses his majority in the house. He may convene either house on the advice of the council of state. His messages to the people must receive the prior approval of his cabinet. His signature is required before a bill passed by parliament becomes law. He is commander of the army.

There is no vice president. If the president is incapacitated or absent from the country, his duties are taken over by a commission consisting of the president of the high court, the prime minister, and the chairman of the senate.

EQUATORIAL GUINEA

Equatorial Guinea consists of mainland territory and offshore islands in the Gulf of Guinea. It has been independent from Spain since 1968, having gained this status after numerous appeals to the UN. After elections, the president takes office for a 5-year term; he is also minister of foreign affairs. The constitution, adopted in July 1968, set up a unicameral national assembly of 35 members, also with 5-year terms.

ETHIOPIA

This ancient kingdom in northeast Africa resisted European colonization until 1936 when it was conquered by Italy. Italy's occupation ended in 1941. After World War II the former Italian colony of Eritrea was added to Ethiopia, giving it an outlet on the Red Sea.

The emperor of Ethiopia granted a constitution in 1931. A new constitution was issued in July 1974. It was in effect for only a short time before a military coup suspended the constitution and deposed Emperor Haile Selassie, who had ruled for 58 years, in September 1974.

Ethiopia is ruled by the Dergue, a military administrative council composed of 60–70 members elected by the armed forces. The Dergue consists of three bodies: congress, a central committee, and a permanent committee. The chairman of the Dergue is the head of state and the chief of government. Real power lies within an inner circle of military officers.

Ethiopia is a founding member of both the UN and the Organization of African Unity.

FIJI

Fiji, a possession and dependency of Great Britain from 1874, was granted increasing measures of self-government during the 1960's, and attained complete independence as a nation in October, 1970. Governmental authority is vested in an elected House of Representatives, a Prime Minister, and a Governor-General, who represents the Sovereign of England in Fiji, as Fiji is a member of the Commonwealth.

FINLAND

Finland, formerly a province of Russia, became independent in 1917, first as a kingdom. In 1919, a republic was established.

According to the constitution of 1919, government belongs to the people, who are represented by a Parliament of 200 members elected for 4-year terms by universal suffrage with proportional representation. Voters must be over 21 years of age. The executive power is vested in a president, who is chosen for a term of 6 years by an electoral college elected by the citizens. The president supervises the administration, conducts foreign relations, and is commander in chief of the army. Foreign treaties, as well as the decision of peace and war, require the ratification of the Chamber. The president may initiate legislation and may dissolve the Chamber; he exercises the pardoning power and presides over the council of state, or cabinet of ministers, when present. He has a suspensive veto on legislation, during which suspensive period the president may request the counsel of the supreme court or of the supreme administrative court. If a measure is then not approved, it may become a law only after its re-enactment without alteration by a newly elected Chamber.

The constitution provides that the decisions of the president, except for supervising administration and for directing the "arraignment of ministers," must be countersigned by a minister; that ministers must decline counter signature if the president's action is contrary to the fundamental law; and that the council of ministers must enjoy the confidence of the Chamber.

The supreme court is established by the constitution; trial courts, by legislation. A supreme administrative court, which is a tribunal of last resort on questions of administrative law, is established by the constitution. Both the supreme court and the supreme administrative court have the right to address the president on the subject of necessary legislation.

While the president is intrusted with the enforcement of laws, a "solicitor" supervises the enforcement of laws in court and other proceedings. In county district courts, the jurors are 12 farmers owning property, but the judge decides the case unless the jurors are unanimously opposed, in which event their decision prevails.

FRANCE

The government of France since the Revolution has undergone many fundamental changes. Its present government, established in 1958, is known as the Fifth Republic. Republican government was first established in the wake of the revolution of 1791, but the monarchical idea died hard; an emperor and several kings succeeded. The Second Republic was established in 1848 when Louis Philippe abdicated. The Third Republic, established in 1871 after the deposition of Napoleon III, lasted until after World War II. It was succeeded by the Fourth Republic in 1947 and finally by the Fifth Republic in 1958.

The comparative instability of government in France may be explained in part by the fact that France failed to achieve national unity until many centuries after England was first unified under its Saxon kings. Hence there was not such a long experience of popular rights slowly acquired and jealously guarded. Under the Third Republic in its later years and under the Fourth Republic, parties in the legislature grew so numerous that it became more and more difficult to form a stable administration. The Fifth Republic was formed because the government was paralyzed in the face of an army revolt over a war in Algeria. The ministry called on Charles De Gaulle to take the helm. He consented on condition that he be given a free hand for a stated period and be allowed to carry to the voters his proposal for a new constitution. His new constitution was adopted by over 80 per cent of the voters in France and its overseas dependencies in a referendum held September 28, 1958.

Administration. Much that is fundamental in French government is contained in earlier laws which have survived constitutional changes. Particularly is this the case with administrative laws, which have undergone little change since their enactment under Napoleon in 1800.

For administrative purposes, France is divided into districts called "departments," 95 in number. The departments are arbitrary divisions, approximately equal in area and in population and have no relation to the historic provinces, such as Normandy, Picardy, Champagne, or Gascony, which the French Revolution erased as political subdivisions. The departments are all named after physical features, such as rivers and mountains.

Each department is subdivided, for convenience of administration, into two or more *arrondissements*. In each department and in each arrondissement a town is designated as the seat of administration and is called the "chief place." In each chief place is a public building, the seat of local government, called the "prefecture" or "subprefecture."

The Prefect. The entire public administration, national and local, within the department, is in charge of a trained official called the prefect, who is appointed and directed by the minister of the interior and who is never a native of the department whose affairs he directs. The prefect reports, not alone to the minister of the interior, but to the other ministers of the government whose local interests he superintends. In the arrondissements, subprefects assist the prefect. To further aid and counsel this important official, there is the prefectural council, composed of 3 or 4 trained functionaries who, presided over by the prefect, constitute an administrative court to hear complaints against public actions, to adjust taxation, to examine departmental and communal budgets, and to settle questions of jurisdiction.

General Council. To supply a measure of local representation, there is a departmental assembly, or local legislature, called the "general council," which consists of from 17 to 67 members, according to the size of the department. This council is elected by the people of the department for a term of 6 years, one-half elected each 3 years. The general council meets at least twice a year, its most important tasks being to examine the departmental budget and the rates, and to audit the economic conduct of the prefectural government. Within the arrondissements is a lesser territorial subdivision, the "canton," which has no administrative significance but is the jurisdiction of the justice of the peace and is an election district for the general council.

Communes. The entire territory of France is comprised in municipal organizations called "communes," the number exceeding 36,000. They vary greatly in size and in population. All, except Paris, are governed under a single brief code, the municipal law of 1884. Each commune has a municipal council composed of from 10 to 36 members, elected by universal suffrage for 4 years by "general ticket," and a mayor elected by the municipal council, who may be assisted by one or more aides called "adjoints." All serve without pay. The position of

mayor is highly honorable, has been filled by many statesmen of distinction, and is sometimes held by one trusted individual for many years.

The mayor has large powers, not only as a local official, but also as the agent of the national government for all its interests within the commune. He controls the local police and, like the prefect above him, may issue police ordinances covering a wide field. For the enforcement of laws and for the maintenance of public order, he is responsible, not to the government or the inhabitants of the commune, but to the prefect of the department. Against excessive or illegal actions of the mayor, appeal may be had to the prefectural council and from that court an appeal is made to the highest administrative court, the council of state at Paris.

The Council of State. This body, historically a heritage from the "ancient regime" but reformed by Napoleon, in recent decades has developed as the supreme administrative court into a regulatory organ of administration of the first importance. Its decisions form a legal corpus known as the administrative law. It is the capstone of a system of centralized administration which has been found equally serviceable under empire, monarchy, or republic.

The Executive. The Fifth Republic, unlike its predecessors, gives the president very wide powers. He is elected for a term of 7 years. The constitution originally provided that he should be chosen by an electoral college of national and local representatives totaling about 80,000. In 1962, however, the constitution was amended to provide for direct universal suffrage in presidential elections. Overseas departments and territories may participate but not, as originally, states which are bound to France merely as members of the French Community. Campaigning is strictly regulated by national and local electoral control commissions. Campaigns may begin only after the official list of candidates is published and must cease on the Friday before the Sunday on which the election is held. Two hours of radio and of television time is allotted to each candidate in an order determined by lot. The display of posters is likewise strictly regulated. If no candidate receives a majority of the votes on the first election day, a second election is held on a Sunday following shortly thereafter. Those candidates who wish may withdraw, and the two others who received the highest number of votes on the first election day are placed on the ballot.

The president has exclusive powers and powers shared with the prime minister. In his own right, he chooses the prime minister, dissolves the Assembly, may address the Assembly (but not the nation without the prime minister's consent), may request opinions as to constitutionality from the constitutional council, 3 of whose 9 members he appoints, and assumes emergency powers in a crisis. He may also veto laws by withholding his assent. Although the prime minister and other ministers, chosen by him, are responsible to Parliament, they may not be members of Parliament. The president can compel their acceptance by Parliament by threatening to dissolve the Assembly. He presides over the council of ministers, on whose advice he issues orders either pursuant to law or in fields excluded from the competency of the legislature.

The Legislature. Parliament comprises two houses—the National Assembly and the Senate. The National Assembly is elected by universal suffrage of all citizens over 21. Elections are held on two successive Sundays. In the first balloting, a majority of all votes cast is necessary to election; in the second, a plurality suffices. The membership is 552, elected for 5-year terms, which may be reduced if the Assembly is dissolved earlier.

The Senate is composed of 302 members elected indirectly by universal suffrage for 9-year terms, one-third being renewed each 3 years. They are chosen by an electoral college composed of municipal councilmen and a smaller number of specially elected deputies under a system favoring small city and rural areas. The total electoral college numbers about 120,000.

Bills may originate in either house or in the president's council of ministers. The budget and money bills may originate only in the council, all of whose bills have precedence in that they may not be amended. No assemblyman or senator may introduce a bill which increases or decreases budgeted expenditures. If the budget is not voted with a prescribed limit, the president may put it into effect by decree. If a bill passed by one house is defeated by the other, it may again be taken up by the first house and sent to the second. If no agreement can be reached, the prime minister may refer it to a joint committee, whose bill is again submitted to both houses. If again defeated, the president may ask the Assembly to cast the deciding vote. Treaties must be ratified by the Assembly, and their provisions may override domestic laws.

The constitution defines two fields of rule making —one reserved to Parliament and the other to the president, with the residual powers exercised by the president through executive orders. Hence disputes may arise whether a measure falls within the reserved powers of Parliament or whether it does not and therefore may be the subject of an executive order. A constitutional council is set up to determine such disputes and other matters of constitutionality. It consists of former presidents and 9 appointed members—3 by the president and 3 by each of the two houses. It may be required to give an opinion within a month on questions submitted by the president, the prime minister, or the chairman of the Assembly or the Senate.

The French Community. In the referendum for adoption of the constitution of 1958, it was participated in, not only by metropolitan France, but by all French dependencies. French dependencies were permitted, in the same referendum, to choose among three options: (a) to retain their present status, (b) to become overseas departments of France, and (c) to become autonomous member states of the French Community. One state, Guinea, voted not to accept the constitution and became automatically independent. Twelve states voted to be members of the Community. Although this entailed French citizenship, French control of foreign policy, defense, and money, and appointment of a head of state by Paris, each state adopted its own constitution modeled in general on that of France.

In 1960, the constitution of 1958 was amended so as to provide for complete independence of the states. Membership in the Community then became a matter of negotiation between France and the newly independent state. Some made such agreement before admission to the United Nations; most of them after admission. All of them concluded special agreements with France covering trade and economic assistance. Their relationship to France became analogous to that between Great Britain and the other members of the British Commonwealth.

GABON

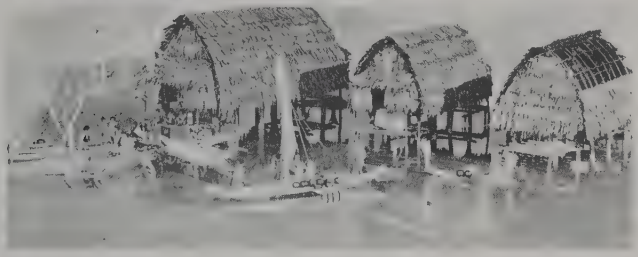
This republic was proclaimed in 1960. A president is the chief executive officer, chosen for a 7-year term by universal suffrage. An absolute majority is requisite, by means of a run-off election if necessary. The president names a vice president, to whom he may delegate most powers and who serves temporarily in case of the president's incapacity or death in office. Legislative power is vested primarily in a unicameral National Assembly, whose members are elected for 5-year terms by universal suffrage. The president, however, may also initiate legislation to be passed by the Assembly. He has a limited power of veto.

FOREIGN HIGHLIGHTS

Located in the capital city of Jerusalem, Israel, Yad Vashem (Memorial Shrine) is dedicated to the memory of the Nazi victims of the world.

Left A store house in Rotorua, New Zealand, reserved for the food eaten by the native priests (tohunga) of the Maori people, is a striking example of the intricate wood carving for which these people are noted.

New Zealand Consulate General



Above Community life for a people who live over water is shown in this typical village of the Manus tribe in the Admiralty Islands in the Pacific. Since all necessities of life depend upon their skill in fishing, they trade fish for both vegetable food, and wood for their homes and canoes.

Right The Buddha of Wat Doi Suteb, Chiengmai, Thailand, is made of brick stucco and is heavily gilded. The approach to the wat (temple) is through columns of pines festooned with orchids. Thailand has about 16,000 temples.

Left Residents and tourists alike enjoy outstanding plays and light operas presented at the beautiful O'Keefe Centre for the Performing Arts in Toronto, Canada.

GAMBIA

Gambia is a small country on the west coast of Africa. It became a republic within the British Commonwealth in 1970. Parliament has 32 popularly elected members, 4 chiefs elected by chiefs in assemblies, and a speaker and deputy speaker appointed by the governor general.

GERMANY

No country in modern times has had such a long tortured governmental evolution as has Germany. No important country is still faced with so many governmental problems not yet soluble.

First, Germany was not even a political entity until 1871, when Prince Bismarck created a monarchical state under the leadership of Prussia, with a strong militaristic bent. Defeated in World War I, Germany turned to a democracy and operated under a constitution framed at Weimar in 1919. This constitution was not proof against subversion by Hitler, who converted the government into a personal dictatorship. Precipitating Germany into World War II, Hitler in effect delivered his country into the hands of victors, who, dividing in the hour of victory, cut his country into two parts under two governmental systems of opposite and conflicting character. There are now a West Germany under a democratic constitution and an East Germany under a Communist regime.

The Germany of 1871 was made up of 25 states: 4 kingdoms, Prussia, Bavaria, Saxony, and Württemberg; 18 lesser principalities, grand duchies, and mark-graviates; and 3 "free cities," Hamburg, Lubeck, and Bremen, survivors of the old "Hanseatic League" of German trading cities. The states retained their own interior administration, generally monarchical, except in the free cities.

First German Constitution. Under the first constitution, the federal government comprised a legislature consisting, first, of an elective body, the *Reichstag*, or Imperial Diet, of 397 members chosen by popular election on the basis of universal manhood suffrage.

The upper house was a unique institution, the heritage of earlier German diets, and was called the *Bundesrat*, or "Federal Council." It was composed of 61 representatives of the federated states, of which Prussia had 17. These members were the appointees of the governments represented and were usually high ranking members of these governments, under whose instructions they acted. The Bundesrat had predominant powers. It initiated practically all legislation, and no bill could be considered by the Reichstag without the consent of the Bundesrat. It took cognizance of the failure of any state to execute imperial laws and could sanction the employment of armed force to coerce a state into obedience. It was presided over by the imperial chancellor, who was the head of the national administration and controlled all its political departments. This official was the personal choice of the German emperor and was responsible to him alone.

The imperial chancellor was usually prime minister of Prussia as well and head of the government of that predominant state. Bismarck established the principle that other imperial ministers, foreign affairs, finance, war, navy, etc., were responsible to the chancellor and must report to the emperor through him. The emperor was the king of Prussia.

The Weimar Constitution. Germany's defeat in 1918 brought about the emperor's abdication and the disappearance of the monarchies in all the states. Each state held a constitutional convention and adopted a democratic constitution. Germany became a union of republics. This form of state government was a requirement under the federal constitution of Weimar.

The new German constitution established a universal, equal, direct, and secret franchise of male and female voters and a system of proportional representation. All states acquired popularly elected diets or assemblies. The conduct of government was entrusted to a commission or "cabinet" of ministers. The chairman of this body bore the title of "president" or "premier."

The Reichstag, or popular legislative chamber, was elected on most liberal suffrage conditions. The former Bundesrat reappeared as an imperial senate, the *Reichsrat*, in which the states were represented roughly in proportion to population. The "cabinet," composed of the chancellor and of ministers, required the support of the Reichstag. The constitution guaranteed equality before the law; freedom of religion, of speech, and of the press; and abolished all class privileges of whatever kind.

The president of the empire was elected by the whole German people for a term of 7 years. He had the unusual power of ordering a referendum of laws which did not command his approval or of proposed laws on which the chambers disagreed. While most executive acts had to be performed through ministers responsible to the Reichstag, the president commanded the armed forces of the Reich and might declare martial law or a "state of siege." Finally, he might dissolve the Reichstag and order a new election. The president might be removed from office by vote of the people on proposal of the national legislature.

Nazi Rule. On March 23, 1933, the principal provisions of the Weimar constitution were set aside by vote of the Reichstag, which entrusted complete dictatorial powers to Adolph Hitler, leader of a new National Socialist party, abbreviated as Nazi. Hitler immediately placed governors in control of the individual states and empowered them to appoint state premiers who were to pick their own cabinets. The cabinets were made independent of the state legislatures, being responsible solely to the national dictator. These legislatures were later dissolved.

All law-making activities were centered in a cabinet of 16 members headed by Hitler, who adopted the title of *Führer* ("Leader") and Chancellor. His office carried with it supreme authority, or "leadership," in the army, all civil offices, and party activities. The cabinet promulgated laws and could alter the constitution.

Hitler created what he called a totalitarian state, in which all labor unions were dissolved and factory councils representing employers, workers, and the party took their place. Farmers were forbidden to mortgage or sell their land; they could get credit only from the state. Labor battalions of youth under government control were organized. Education was "unified" by seeing to it that teachers and textbooks were in accord with the party doctrine. An attempt was made to unify the churches under state direction, with an infusion of Teutonic mythology. A ministry of propaganda was organized to create and lead public opinion. Anti-Semitic laws discriminated against the Jews, who were almost eliminated from Germany by mass murder.

Division of Germany. When Germany surrendered unconditionally in World War II, there was no government with which the victorious powers could deal. The country was divided into four zones of military government and occupation. Russia occupied Eastern Germany to the upper Elbe; the United States, the south, including most of Bavaria and Württemberg, Hesse, and Hesse-Nassau; Great Britain, the northeastern section, including the Ruhr, Hamburg, and Bremen; and France, an area along the upper Rhine. Berlin was occupied by the four powers jointly, and the four Allied commanders in chief formed a control council with supreme authority.

Russia systematically blocked action in the control council, which broke up by 1948. In the zones controlled by the United States, Great Britain, and France, German states drafted a constitution which

could be valid within the framework of the occupation statute. It was adopted by a German parliamentary council on May 8, 1949, and was promulgated as the constitution of the German Federal Republic.

The Russians meanwhile set up a state in their zone of control, and their administrative functions were transferred in 1950 to the provisional government of the German Democratic Republic.

Berlin was similarly divided, two separate municipalities being formed. East Berlin was part of East Germany, and West Berlin, although cut off from West Germany by 70 miles of intervening East German territory, was claimed as part of West Germany.

German Federal Republic. The constitution, promulgated and approved by voters in the Western occupation zone in 1949, became effective March 15, 1955. A convention was signed with the Western allies by which West Germany would have full authority over its internal and external affairs, with reservations relating to stationing armed forces in Germany and also to the status of Berlin and to questions relating to unification and the final peace settlement.

The constitution provides that it applies to Berlin and is to be put into force in the Eastern zone upon the latter's accession. While freedom of speech, press, and organization is guaranteed, this freedom is limited so as to exclude the enemies of a free, democratic basic order.

The legislature consists of a Federal Diet (*Bundestag*) and a Federal Council (*Bundesrat*). Members of the Diet are elected for a 4-year term by universal suffrage. The Council consists of members of the governments of the constituent republics, each sending at least 3 but as many as 5 if the population is over 6,000,000.

A president is chosen for a 5-year term by an electoral college consisting of members of the Diet and an equal number elected by the diets of the constituent republics. The president can succeed himself only once. The president nominates a chancellor who must be elected by the Diet, and the chancellor selects ministers for appointment by the president. The Diet may elect a new chancellor, an act which is equivalent to a vote of no confidence in the incumbent chancellor, and the president must appoint the new chancellor. If the chancellor proposes a vote of confidence and this is defeated, the president may, on the chancellor's proposal, dissolve the Diet unless a new chancellor has been elected within 21 days.

Bills may be introduced into the Diet by individual members or by members of the cabinet. Bills introduced by the latter may be on the cabinet's initiative or they may be bills passed by the Council and turned over to the cabinet to send to the Diet with cabinet recommendations. Bills passed by the Diet go to the Council, which may veto but not amend them. This veto may be overridden by the Diet—a simple majority veto by a majority vote and a two-thirds majority veto by a two-thirds vote. The president has no veto power. But appeal may be made against a bill to a federal constitutional court, whose members are appointed half by the Diet and half by the Council. Members of these bodies may not be appointed to the court.

The president may be impeached for willful violation of the law on a two-thirds vote of either legislative body. Trial is before the federal constitutional court. The place of the president, however, in the German constitutional scheme, is inferior to that of the chancellor, who speaks as head of the government.

West Germany is divided into 11 states (*Länder*), each of which has a government parallel to that of the federal republic. The states include the western section of the city of Berlin.

German Democratic Republic. The constitution of East Germany was promulgated in 1950. The constitution makes it a crime to boycott democratic organizations and to manifest religious or racial hatreds. Estates of over 100 hectares are forbidden, such estates being dissolved and redistributed without compensation. Private monopolistic organizations aiming at increase of profits by control of prices, production, and markets are prohibited.

The supreme legislative body is the People's Chamber, its 500 members being elected for 4-year terms by universal suffrage of those over 18 years of age. Candidates are limited to those nominated by the Communist party. The Chamber may be dissolved before the end of its term on its own resolution, by referendum, or on a vote of no confidence. Under an amendment of 1960, the Chamber elects, not a presidium headed by a president, as before, but a council of state, consisting of a chairman, 6 deputy chairmen, 16 members, and a secretary. The council is authorized to issue decrees with the force of laws and to interpret the laws.

The Chamber elects also a cabinet, headed by a prime minister, one of whom is charged with the duty of economic planning, in which he has the assistance of the economic council. The real power, however, lies with the politburo of the Communist party, which consists of 14 full members and 9 candidate members. Its secretary is the key man in the government.

GHANA

Ghana was formerly under British rule as the Gold Coast colony and trusteed territory of Togoland. It was granted independence in 1957 and, in 1960, became a republic within the British Commonwealth. Kwame Nkrumah was the republic's first president.

A military coup was staged in 1972, resulting in the establishment of a military regime and the suspension of the 1969 constitution. In October 1975 a supreme military council was established as the administrative and legislative body. It consists of a chairman (the head of state) and six other members appointed by virtue of service appointments. The national redemption council is a subordinate body of the military council; it also is directed by the head of state. Members are appointed by virtue of their service appointments in the government and armed forces. For administrative functions commissioners have been named to head the various ministries. Ghana is divided into nine regions; each region is administered by a regional commissioner, who is an army officer.

GREAT BRITAIN

The United Kingdom of Great Britain and Northern Ireland adopted its present title in 1920, when southern Ireland (Eire) was separated from the kingdom. Northern Ireland is represented in the British Parliament as an integral part of the kingdom and it also has its own local government under a governor and parliament.

Great Britain is the oldest political society in Europe and the oldest kingdom in the world, if one excepts the 11-year interruption of the Cromwellian period. When one of the feudal lords of France, William of Normandy, conquered England in 1066, it was already a unified monarchy. Wales was conquered in 1283 and incorporated in the kingdom about 1500. The thrones of England and Scotland were combined in 1707 by the Act of Union, when their parliaments were combined into a single legislature.

Great Britain was the cradle of democracy in the modern world. There, over a period of 800 years, a struggle between ruler and people resulted in the representative institutions which have given it the title of mother of parliaments. This long political experience enabled it to adapt itself to social and economic changes without the bloody revolutions such as France and Russia passed through. Unlike practically all other countries Great Britain does

not have a formal constitution. Its frame of government is based on acts of Parliament passed in the course of many centuries

Seat of Government. Adjoining the ancient city of London is Westminster, which was chosen as a residence by the Norman kings and is the seat of British government. Here are "Whitehall Street" and "Downing Street," with the residence of the prime minister; Westminster Hall and Abbey; and the modern houses of Parliament. The British sovereign lives at Buckingham palace or other royal residences, or at Windsor castle on the Thames, 21 miles from London. From this latter ancient residence of British sovereigns, Edward VII adopted in 1917 the family name of House of Windsor.

The British Monarchy. The monarchy, which was firmly established on a national basis by William the Conqueror and by his successors, attained its greatest power and influence under the Tudors, Henry VII, Henry VIII, and Queen Elizabeth I; but their successors, the Stuart kings, aiming at an absolutism attained elsewhere in European kingdoms, were summarily checked by Parliament, which beheaded Charles I and expelled James II.

The long conflict between king and Parliament for state control resulted in the complete supremacy of Parliament and the reduction of the sovereign to a symbol of national loyalty and to a position of simple influence. "The king rules but does not govern." All crown powers are exercised in his name by ministers who are no longer his choice but who are a committee of members of Parliament, dependent upon the House of Commons for continuance of office.

Ministers. There are some 43 high officials known as ministers, selected by the prime minister, the actual leader of the majority in the Commons. The chief ministers are the lord president of the council and minister for science; the lord chancellor, who presides over the House of Lords and over the supreme court of judicature and is a general minister of justice; the chancellor of the exchequer, who is the financial minister; 4 secretaries of state—first, foreign affairs, home affairs, and commonwealth relations and colonies; the first lord of the admiralty; the president of the boards of trade; the ministers of defense, transport, education, health, labor, and agriculture and fisheries; the secretary for Scotland; and the attorney-general. Several offices—lord president of the privy council, the first lord of the treasury, lord of the privy seal, and the chancellor of the Duchy of Lancaster—have become sinecures; they are usually taken by the prime minister and by members left free of administrative duties, or "without portfolio."

Of these ministers, a minor group constitutes, with the prime minister, the "cabinet." The cabinet determines policies, settles the budget and financial schemes for submission to Commons, institutes practically all legislation, and takes responsibility at all times before Parliament for the conduct of government. A refusal of the House of Commons to follow the cabinet's lead or to enact its measures results either in the immediate resignation of the ministry or in "an appeal to the country," that is, the dissolution of the Commons and an election of a new House.

Parliamentary Government. This historically established organization for conducting the government has given to the world the widely imitated institution of "parliamentary," "responsible," or "ministerial" government, as distinguished from "presidential government" wherein the chief executive has a tenure independent of the legislative or parliamentary body.

The British Parliament consists of the House of Lords and of the House of Commons. The members of the Commons are elected for a term of 5 years or until a dissolution of the House. A member need not, and seldom does, reside in his "constituency." The House of Lords has a membership of about 1,118 and includes the archbishops of Canterbury and York; bishops of the English Church; and "peers" created by the sovereign on recommendation of the prime minister, comprising, in order of rank, dukes, marquises, earls, barons, and "life peers."

Down to 1911, the Lords had a legislative position comparable with the Commons, except in initiation of financial legislation. Its opposition to legislation demanded by the Commons could be overcome only by the threat to create enough new peers favorable to the law to "swamp the Lords." In 1832, this threat was effectual in securing the passage of the "Reform act" and was used in 1911 to pass the "Parliament act" whereby the supremacy of the Commons is recognized. Under this act, if the Commons passes an act in three successive sessions within an interval of not less than two years, it may become a law without the consent of the Lords. No "money bill" may be denied assent by the Lords, and the "speaker" of the Commons is the final judge of whether or not any certain act is a money bill. The king must give assent to every bill of Parliament. To refuse would be an unconstitutional act; in fact, it would be an act of revolution.

Sovereignty. The "King, Lords, and Commons" legally have complete sovereign powers; no political act is beyond their competence. They can legally alter, in any particular, the constitution of Great Britain and her dependencies. Until the passage of the Statute of Westminster in 1931, they had the theoretical right to legislate for the self-governing dominions also.

The constitution of Great Britain consists of a great number of separate acts, as well as of established practices which can be altered only by Parliament itself. These acts have never been codified or reduced to a single charter, and in this sense the British constitution is "unwritten." Since it can be changed by Parliament itself, it is spoken of as "flexible" as distinguished from "rigid" or "written" constitutions.

Previously to 1832, suffrage in Great Britain was restricted to the aristocratic and land-owning class. By the "Reform acts" of 1832, 1867, and 1884, it was successively extended, and, by the "Representation of the People act" of 1918, full manhood suffrage was realized, and the vote was given to women 30 years of age. By the "Equal Franchise act" of 1928, women were admitted to complete equal suffrage with men. The voting age is 21, with residential qualifications. Voting has for many years been carefully protected by a Corrupt Practices act. Thus, under the forms of a monarchy, Great Britain, now almost the last remaining kingly government of consequence, has become in fact one of the most democratic of countries. The families of the nobility, however, continue to exercise a leadership and an influence found today in few other countries.

Local Government. For purposes of local government, England and Wales are divided into 62 "administrative counties" and 87 county boroughs. Northern Ireland is divided into 6 administrative counties and 2 boroughs. County government is ordered by the Local Government act of 1888, which provides elective councils to supervise local government and to appoint the county officials. Its chief responsibilities are for local communications, education, asylums, and police. In Scotland, local government is the responsibility of the Scottish development department, set up in 1962.

English boroughs or towns before 1835 were close corporations, governed largely in the interests of a narrow body of "freeholders." By the Municipal Corporations act of that year, a systematic and more liberal form of city government was introduced, whereby the borough council became the city administration. This body acts through committees and employs city officials who, while relatively few in number, are chosen for experience and qualifications. The most unusual of these is the

"clerk." While conforming to a general type, the powers of boroughs are expressly given by charters or by acts of Parliament, and the latter body is constantly importuned to extend the functions of boroughs. Nearly all so-called "private bills" are of this character.

The "mayor" of an English town is in no sense the head of its administration. The office, usually held for one year, is important in a social and a civic sense, and frequently imposes upon the occupant considerable expenditure for entertainment and for representation of the borough.

London. The government of London must be described separately. At its center is the ancient "City of London." This is still an "unreformed" English borough, governed by a close corporation of "councilmen" and "aldermen." The "lord mayor of London" is the presiding head; he resides in "Mansion House" and is an important civic figure in British life. Surrounding the city is the county of London, made up of 28 boroughs with district governments; but the London County council, created in 1888, has definite general powers over the whole area. The "Metropolitan Police Area" includes London county and extends over adjacent territory for nearly 700 square miles. To the metropolitan police is entrusted the public order of this central part of England. This highly trained force, with its headquarters at New Scotland Yard, is directly under the home secretary of Great Britain.

GREECE

Until 1967 Greece was a constitutional monarchy under a charter adopted in 1952, designating it as a crowned democracy. The reign of Constantine II, who became king in 1964, was marked by crises and he was forced to flee on Dec. 14, 1967, after a rightist junta seized power.

The Greek parliament had been dissolved before the April 1967 coup in preparation for parliamentary elections scheduled for May, but which were never held. Parliament remained dissolved. Col. George Papadopoulos was named premier and another officer was appointed "regent" to replace the king. In December 1967 and February 1968 the officers of the junta resigned their commissions and formed a "civilian" cabinet. A new constitution was drafted to be voted on by the people in September 1968. Greek voters approved the new charter submitted by the junta to replace that of 1952. The new constitution went into effect in November 1968. A new cabinet was named in December and Papadopoulos was confirmed as premier.

Civilian control of the government resumed on July 23, 1974, and the present constitution was adopted June 7, 1975. Under the new charter, the president is elected by a two-thirds majority of the legislature to a 5-year term. He has the power to appoint cabinet members and the premier, to dissolve parliament, and to veto legislation. He can also declare martial law and rule by decree for as long as 30 days without the approval of parliament.

The legislature is a single-chamber body of 300 members elected to 4-year terms by direct universal vote. The judiciary consists of a supreme court and lower courts. The 1975 constitution also changed the formal name of Greece to the Hellenic Republic.

GRENADA

Located in the Caribbean Sea, Grenada occupies the southernmost island of the Windward chain. Grenada was granted self-government in 1967 as part of the British West Indies Associated States. Following a constitutional conference in London, Grenada became independent within the British Commonwealth on February 7, 1974. It is a parliamentary state on the British model. The legislative branch consists of a 13-member senate and a 15-member house of representatives. House members are elected every five years by universal vote, while the senate is appointed by the governor general, who as part of the executive branch, is appointed by the ruler of England. The majority party in the house of representatives forms the government, and its leader becomes prime minister, the head of state. Divided into six parishes and one dependency (Carriacou), Grenada is served by a regional supreme court.

GUATEMALA

Guatemala achieved independence in 1821 and became a republic with an elected president in 1944. The constitution of 1956 extended suffrage to all men and all literate women, the minimum age being 18. Voting was compulsory for the literate and optional for the illiterate.

A new constitution became effective in 1966. The head of government remained the president, elected every 4 years. Under him is the cabinet, the council of state consisting of 14 members from the three branches of government, and the national congress, a body of 55 members elected by universal suffrage for 4-year terms. The country is divided into 22 departments, each administered by a governor appointed by the president. Municipalities elect their own mayors and councils.

Since the late 1960s Guatemala has suffered terrorism from both the left and right. Following the kidnapping and execution by leftists of the West German ambassador in 1970, a state of siege was declared and constitutional guarantees were revoked.

GUINEA

The former French Guinea decided in a referendum in 1958 to separate itself from the French Community and later the same year proclaimed itself an independent "democratic, secular, and social republic." A National Assembly, whose members are elected by universal suffrage on a national list for a 5-year term, has sole and unlimited power to legislate. The president is popularly elected for a 7-year term. He names the cabinet from Assembly members, and they are responsible to him, but he is responsible to the Assembly and must promulgate all laws passed by it. He has no power of veto.

GUINEA-BISSAU

Discovered by Nuno Tristao in 1446, Guinea-Bissau is located on the west coast of Africa and was formerly known as Portuguese Guinea. It became a separate colony in 1879 and an overseas province in 1951. In the 1960s the Party for the Independence of Guinea-Bissau waged war against the Portuguese troops and formed their own government. When the Independence party, then controlling most of the country, adopted a constitution in 1973, Portugal decided to give it recognition. On September 10, 1974, Guinea-Bissau became a republic. The Independence party remained the sole political group. The people elect the national assembly, which carries out legislative functions. The assembly members, who serve 3-year terms, elect the council of state. The 15-member council of state serves in an executive capacity, and elects its own presiding officer, who heads the government and is aided by a commissioner of foreign affairs.

GUYANA

Formerly British Guiana, Guyana is an independent South American cooperative republic within the Commonwealth. Its head of state is the British sovereign, represented by a president. The head of the government is the prime minister. The present constitution came into effect in 1966. The legislative body is a unicameral national assembly of 53 members, elected on the basis of proportional representation.

Originally a French colony, Haiti became independent in January 1804. The constitution and laws of the government purported to construct a republic after the French model. In practice, the government for more than a century was a military despotism in the hands of the president.

The constitution of 1964 provides for a single-chamber legislature of 58 deputies known as the legislative chamber. Its members are elected for 6-year terms by majority vote in "primary assemblies." They may be reelected indefinitely. This body meets also as the national assembly for purposes such as declaration of war, consideration of treaties, revision of the constitution, and as a high court. The chamber may be dissolved by the president in case of serious disagreement with him. New elections are then held.

The president alone has the power to introduce money bills in the chamber. He has a limited veto, which can be overridden by a two-thirds majority. If he fails to approve a bill before the chamber adjourns, the bill retains its status when the next session begins. The president is assisted by a cabinet responsible to him, although the members may appear in the legislature to support measures of the president. He appoints the justices of the supreme court, who have life tenure. Local government is carried on by communal councils chosen for 6-year terms.

The president also holds life tenure. Francois Duvalier was elected president in 1961. In 1964, in accordance with a constitutional change, he was named president for life. After his death, in 1971, he was succeeded as life president by his son, Jean-Claude Duvalier, whom he had nominated.

HONDURAS

Honduras revolted against Spain with the other Central American provinces in 1824. In 1838 Honduras adopted its own constitution which has been revised repeatedly. After a 1972 coup the congress was suspended; the country was then governed by decree.

HUNGARY

The Hungarian Republic of Workers and Working Peasants is the designation adopted in 1949 by the Communist government of Hungary, which was set up under Russian pressure after World War II. The country had been established as an independent nation after World War I. It was ruled as a regency for a vacant monarchy until World War II, when, having joined with Germany, it shared in the debacle of the Axis and was occupied by Russian troops. A rebellion in 1956 was crushed with Russian help, leaving the government unchanged in form but with a perceptibly wider latitude under its Russian tutelage.

The governing party is known as the Hungarian Socialist Workers' Party. The first secretary of the party is also the prime minister and effective ruler of the state. Parliament consists of about 340 deputies, all nominated by the party and elected for 4-year terms. A presidential council exercises legislative power between sessions of Parliament and can annul legislation if deemed unconstitutional or detrimental to the working people. As is the custom in Communist governments, however, such bodies are under the control of the politburo of the party, whose president is usually the first secretary of the party. Parliament normally gives a unanimous assent to measures which the politburo proposes through the prime minister and first secretary of the party.

Although the constitution recognizes the right of private property if it does not violate the public interest, the chief means of production are in the hands of the state and of party-controlled cooperatives.

From 930 to 1264, Iceland was an independent republic. It was joined to Norway in 1264 and with Norway came under the rule of Danish kings in 1381. It so remained until December 1, 1918. By the act of Union of November 30, 1918, it was recognized as a sovereign state in personal union with Denmark through the monarch. This act was to expire in 1943, and Icelandic opinion was against its renewal. On the invasion of Denmark by the Germans, Iceland was occupied by British troops, who later were replaced by Americans. On May 17, 1941, Iceland declared its complete autonomy under an elected regent. Formal separation from Denmark took place June 17, 1944.

The present constitution of Iceland was adopted on May 18, 1920, but was radically amended in 1934 and 1944. The executive power is exercised in Iceland by a president, elected for a 4-year term. He is assisted by a cabinet appointed by him but responsible also to the legislature, or *Althing*, which can impeach cabinet members before a special tribunal for parliamentary impeachment, the *Landsdomur*. The Althing consists of 2 chambers with a total of 60 members elected by proportional representation for 4-year terms. Upon assembling, it selects 20 members for the upper house, while the remaining 40 form the lower house. The two sit together to vote on bills approved by one House and disapproved by the other, a two-thirds majority being required for affirmative action. Budget bills form an exception, a majority being sufficient for adoption.

The president has no direct veto power. If he disapproves a bill, it nevertheless becomes law but must be submitted to a referendum, the outcome of which determines whether it continues as a law or is struck down.

The president's tenure of office may be cut short by a plebiscite held pursuant to a resolution approved by a three-fourths majority of the Althing. In the period between the resolution and the plebiscite, presidential powers are performed as though the presidency were vacant by a committee of the prime minister, speaker of the united Althing, and the chief justice of the supreme court. If the plebiscite rejects the resolution, the Althing must be dissolved and a new election held.

INDIA

India became independent in 1950 after having been part of a British colony for nearly a century, and part of a British dominion since 1947. In 1947 British India was divided into the two nations of India and Pakistan. Each country remained a member of the British Commonwealth of Nations.

In 1976 India was a union of 22 states and 9 territories. Each state and territory is governed by an official named by the president. The president is elected by a body of all elected members of the parliament. A vice president heads the upper house of the two-chamber parliament. The vice president is elected by the two houses and assumes presidential power if the president is unable to act from illness or other cause.

The parliament consists of the upper council of states and the lower house of the people. Council members are chosen partly by the elected members of the state legislatures, with one-tenth appointed by the president from among the more prominent citizens of India. The house consists of not more than 500 members, nearly all elected by popular vote.

The Indian constitution was passed by the constituent assembly in 1949 and became effective in January 1950. The constitution incorporated features of the systems of the United Kingdom, the U.S., and other Western democracies. By 1976 some 30 amendments had been made to the charter. The union of Indian states is more centralized than that

of the U.S. and the rights of states are more limited. In basic human rights the constitution outlawed the old Hindu system of "untouchable" castes; it also prohibited double jeopardy under law and discrimination. Freedom of speech and assembly were guaranteed. The supreme court was empowered to decide on all questions of constitutionality.

The power to form government policy and establish an administrative cabinet is assigned to the prime minister. India's third prime minister, Indira Gandhi, was elected in 1966. She is the daughter of Jawaharlal Nehru, the first Indian prime minister. Her regime was marked by continuing problems of politics and economics.

On June 26, 1975, a state of emergency was declared and Prime Minister Gandhi assumed broad and arbitrary powers. Threats to national security and increasing domestic unrest were cited as reasons for the declaration of the emergency. Political arrests were made and many constitutional rights were suspended, including freedom of speech and assembly. The press was subjected to censorship by a constitutional amendment of January 1976. The courts were forbidden to challenge constitutional amendments and laws passed by parliament; citizens were barred from appealing against restrictions of their rights.

Although a group was formed to oppose emergency rule, opposition for the most part remained underground and unorganized. In 1976 it was reported that some 175,000 political dissidents were in jail. In June 1976, the parliament extended the government's right to hold prisoners for two years without a charge being made against them.

In October 1976 the parliament met for the consideration of further revisions of the constitution. Proposed amendments would increase executive powers once more and would further restrict the powers of the courts. The supreme court was slated to lose its authority to question the substance of legislation—in effect it would be able to pass only on legislative procedures. Yet it was also expected that Prime Minister Gandhi might lift some emergency powers and carry out the long-delayed election process. Many in India felt that emergency rule was necessary in view of national problems. The government had achieved some success in controlling black-market activities and the economy was considered to be improving.

In January 1977 elections were at last scheduled for March. Censorship was ended and political prisoners were freed, among them a former national official, Morarji Desai. Desai then headed a coalition opposed to Indira Gandhi. Supported by popular resentment of sterilization to control population and the forced relocation of slum-dwellers, Desai achieved the greatest turnout of voters in history. After 11 years as head of state, Gandhi saw her party defeated, ending 20 years of control. Gandhi lifted the state of emergency imposed 21 months before and then resigned. Morarji Desai, at 81 and after 19 months in prison, became prime minister, promising restoration of civil liberties and a policy of nonalignment with any foreign power.

INDONESIA

Before Indonesia was recognized as an independent republic in 1949, it had been a colonial empire under the Netherlands since 1809 after nearly 200 years of prior rule by the Dutch East India Company. In World War II, it was conquered by Japan, upon whose defeat in 1945 the territory was formally restored to the Netherlands. However, a nationalistic uprising in Java, Madura, and Sumatra took over those islands from the Japanese. The Indonesian republic was proclaimed with Sukarno as president. Hostilities with the Dutch continued intermittently until 1949, when the Netherlands transferred sovereignty to Indonesia. A constitution adopted that year was superseded in 1950 by another, which Sukarno abrogated by decree in 1959 in order to reinstate the original revolutionary constitution of 1945. By so doing, he made himself practically dictator.

In 1966, army officers and Indonesian Communists forced Sukarno to name Suharto as head of the army. The following year, Sukarno was stripped of power and Suharto became president—the Communist party was then outlawed. Sukarno died in 1970.

The constitution of 1945 provides for six organs:

(1) The People's Congress, which is declared to represent the entire nation. To it is entrusted establishment of national policy and the election of the president. It meets once each 5 years. As to its membership, manner of selection, and term of office, the constitution is silent.

(2) The executive consists of the president and vice president, who serve for 5-year terms and may be re-elected. The president is assisted by a council of ministers chosen by himself and responsible to him alone. He is commander in chief of the army. He is invested also with legislative power, but his legislative measures must be ratified by the legislature. The president has an absolute veto over measures passed by the legislature. He may legislate by decree in an emergency, subject to later ratification.

(3) The unicameral legislature, known as Council of Representatives, which assembles once a year. It is appointed in part by local administrations or functional groups and partly by members representing political parties. However, the president issued a decree in 1960 enabling him to control political parties and, on recommendation of the supreme court, to dissolve them.

(4) A supreme advisory council, or council of state, which has the duty of advising the president on his request and may also submit proposals to him.

(5) The supreme court, which is independent of the government. The constitution is silent on how justices are appointed and on their tenure of office. Different codes of law govern Indonesians, Europeans, and foreign Orientals.

(6) The state controlling council, which accounts for public funds. It is independent of the legislature but makes recommendations to it.

IRAN

This Moslem constitutional monarchy was formerly known as Persia, with a long history as a powerful state both in ancient times and for some centuries in the Christian era. In the past it was able to dominate adjacent territory in periods of strength and yet was open to invasion from northern steppes and western plains in times of weakness. Its modern history is a record of decay, at least until the discovery of extensive oil deposits there in the 20th century. This and its location next to the U.S.S.R. gave it a certain key importance in the national rivalries and the emergent independence of the Arab nations.

Until 1906, Iran was an absolute monarchy. A constitution granted by the shah, or king, in that year, with subsequent amendments, provided for a national consultative assembly of 136 members. Presently, the assembly has 268 members elected to 4-year terms. The constitution also provided for a senate of 60 members, half appointed by the shah and half elected. The senate was constituted for the first time in 1950. The shah may dissolve either or both houses at any time.

The country is divided into 14 provinces, 6 governor-generalships, 151 governorships, and 459 districts. Provinces are divided into counties, each under a governor. The counties are divided into districts and groups of villages, each with its governing official. All the above officials are appointed by the central government. Individual villages, however, have a head man chosen locally.

In 1975 the two-party system was dissolved and a one-party system established. The National Political Resurrection Movement was then formed.

IRAQ

Freed from Turkish rule during World War I, Iraq was assigned as a mandate to Great Britain by the League of Nations and continued as such until 1922. Britain then recognized it as an independent state and concluded with it a treaty of protection. A constituent assembly in 1924 enacted an organic law establishing a limited monarchy and a responsible government. In 1958 an army group overthrew the monarchy and, in an interim constitution, declared Iraq to be an independent, sovereign, Islamic republic but forming an integral part of the Arab nation. Another military revolution terminated the adherence of Iraq to the Arab Federation. The rulers promulgated in 1964 a new interim constitution, which was to be superseded by a permanent republican constitution within three years.

The 1964 constitution provides in effect for a military dictatorship or oligarchy. The manner of choosing the president is not defined, but, in the event his office becomes vacant, his successor must be a member of the national council of the revolutionary command, a body which is not defined in the constitution. The successor is elected in a joint session of the members of this body, the cabinet, and the national defense council, another body not defined by the constitution. The president appoints the prime minister and other members of the cabinet and, with them, lays down the general policy of the state. Both the president and members of the cabinet must be of Iraqui parents from a family resident in Iraq since 1900 A.D., of Ottoman citizenship, and, if married, must have wives with Arab parents and grandparents.

Under a constitutional amendment announced by the prime minister in late 1964, a Consultative Assembly was set up, the members being appointed by a "republican decree" to represent the provinces in proportion to population, one member for each 70,000 to 100,000 inhabitants. The cabinet ministers are *ex officio* members. Its function is to draw up a permanent constitution and to take part in legislation in the interim.

IRELAND. See *Eire, Great Britain.*

ISRAEL

The republic of Israel came into existence on May 14, 1948, when the British mandate over Palestine given by the League of Nations in 1922 was relinquished. The United Nations set up boundaries between Israel and its Arabic neighbors, a move which touched off a war in which the Arabic states tried to conquer Israel, but the latter defeated them and enlarged its territory beyond the limits set by the United Nations.

Israel, like Great Britain, has no written constitution. Its frame of government follows the British model in making the legislature supreme, the president having no more power than the British monarch, but the British system is extensively modified by "basic laws," which are expected eventually to form the basis of a written constitution.

The one-chamber legislature, known as the *Knesset*, adopted the name and size of the Jewish governing body of about 2000 years earlier. Members are elected for a 4-year term, which may be cut short by dissolution voted by the Knesset itself. They are elected by universal suffrage of inhabitants over 18 on a nation-wide system rather than by local constituencies. The method of election is unique. Each political party nominates candidates in a priority determined by the party. Voters cast ballots for a party, not a candidate. The number of members of each party seated in the legislature is determined by the proportion of the total vote cast for that party. Thus, if a party is entitled to seat 15 members, the 15 party candidates having the highest priority are seated. Under this sytsem, it is not expected that any one party will have a clear majority; hence the government is a coalition of parties.

The president is elected by the Knesset for a 5-year term by majority vote and may be removed by a three-fourths vote. He has no veto power but is required to sign all bills adopted. It is his function to select the prime minister, usually the leader of the party with the largest representation in the legislature. The prime minister chooses his cabinet, which may include non-members of the legislature. The latter may sit in the Knesset but without the right to vote. If the cabinet resigns or is, in effect, ousted by a vote of no confidence, the legislature is then required to dissolve itself, and a new election is held.

Civil and religious judges are appointed by the president on the recommendation of a nominating committee. There is no provision for courts to pass on the constitutionality of acts, but merely on their legality. Apart from statutes, Israeli law is based on English common law, Hebraic law, and Moslem law, the last being due to the fact that the country was ruled by Moslems for over 1200 years. The courts are required to accord complete procedural equality of the citizen and the government.

Local government is exercised by municipal corporations, local councils, and regional councils, members of which are popularly elected for 4-year terms. They operate under by-laws and with revenue sources approved by the minister of the interior.

A fundamental law provides that every Jew is entitled to come to Israel as an immigrant.

The organization known as the Jewish Agency has played a principal part in the establishment of social, political, and economic bases that are fundamental to the state of Israel. The agency has continued its role in organizing and maintaining immigration from the Jewish communities of the world.

Another organization, called the Malben, provides services for immigrants to Israel who are sick, handicapped, or advanced in age.

A national insurance law, which came into effect in 1954, administers pensions for the aged, insurance for survivors of broken families, compensation for work-connected injuries or disabilities, maternity insurance, family allotments, and unemployment compensation payments.

ITALY

Italy, now a republic, was once the center of the Western world's political authority under the Roman Empire and again the religious center of Western civilization in the religious union of the Roman Catholic Church. For centuries it was broken into fragments and subjected to foreign domination. It became a unity as a modern state only in 1861, when the king of Sardinia was proclaimed "king of Italy" by the first Italian Parliament. The remainders of the provinces of Mantua and Venetia were added in 1866. In 1870 Rome was entered by Italian troops, the last remnant of the papal states was incorporated in the kingdom, and the "temporal power" of the pope was suppressed.

The Monarchy and Fascism. Under the monarchy the Italian constitution was the fundamental law granted March 4, 1848, to the Kingdom of Sardinia. Around this nucleus Italy was united, and it was adopted as the constitution of the new kingdom. This constitution vested executive power in the sovereign, who was to exercise it through ministers responsible to him. Legislative power resided in the king and a two-chamber legislature.

Under the leadership of Benito Mussolini, the Fascist party seized the government on October 22, 1922. The king accepted Mussolini as prime minister, and the government was gradually transformed. The constitution was not repealed, but much was added.

The dominant feature of the government was the control by the Fascist party which numbered about 5 per cent of the population. The Fascist Grand Council named by the leader (*Il Duce*) might choose his successor. The prime minister and his cabinet issued decrees and executed them. The only other law-making body was the National Council of Corporations. The former Parliament remained but without power.

With the fall of Mussolini the Fascist party was abolished. The king resumed his functions, which, after the taking of Rome, he delegated to Prince Humbert.

When the allies entered Rome, the king retired and formally abdicated in May 1946. In a popular referendum in June, 54 per cent of the people voted for a republic, which came into effect by a new constitution in 1948.

The constitution describes Italy as a "democratic republic founded on work." At the head of the government is a president elected by a joint session of the two houses of Parliament, and 3 additional delegates from each region. His term is 7 years, and he must be 50 years old. He has power to dissolve Parliament, except during the last 6 months of his term. There is no vice president. The speaker of the Senate serves in the event of temporary disability of the president. If the office becomes vacant, the speaker of the Chamber of Deputies orders a new presidential election.

Parliament is made up of the Chamber of Deputies and the Senate. The deputies, one for each 80,000 inhabitants, are elected by direct universal vote and serve 5 years. The senators are elected for 6 years from the regions, one for each 200,000 people, but at least 6 from each region except Aosta, which has one. Besides these, the president, who is himself a senator for life, can appoint 5 life senators from men eminent in science or arts.

The president appoints the prime minister and, on the latter's recommendation, other cabinet ministers. They need not be members of Parliament. The cabinet and prime minister can be forced out of office only by a direct vote of lack of confidence, not by a mere defeat of their measures.

Bills may be introduced by members of Parliament, by members of the cabinet on the president's authorization, by councils of the regions, and by popular referendum on a bill proposed by at least 50,000 voters. A bill approved by both houses goes to the president for approval. If he disapproves, the bill is sent back to Parliament. If it is again passed by both houses, it becomes law.

Italy has the usual system of local and higher courts and courts of appeal. The constitution creates a constitutional court with power to pass upon the constitutionality of laws, decide cases between regions, and try impeachment cases.

Administratively, the country is divided into 19 regions, some of them, as Sicily and Sardinia, partly autonomous; each has a council and executive. The regions are subdivided into provinces, and the provinces are divided into communes, each with its own elective councils. The national Parliament may dissolve the regional councils on specified grounds and arrange for new elections. Laws passed by regional councils must be approved by the president of the republic, who may refer it to the constitutional court for validity or to Parliament on questions of policy.

Roman Catholicism is the state religion, but other religions are tolerated. Civil marriage is allowed, and divorces may be granted. Titles of nobility are no longer recognized, but those granted before 1922 may be used as part of the name.

The constitution may be amended by proposals passed by both houses of Parliament and passed again in 2 successive sessions at intervals of not less than 3 months. Thereafter the proposal must be again approved by an absolute majority of all members in each house. The republican form of government is not subject to amendment.

After 25 years of Fascist rule and five years of war, Italy was plagued by unemployment and civil dissension. Vatican and U.S. aid under the Marshall Plan helped Italy through its postwar troubles. Italy also became a member of NATO. By the Treaty of Rome in 1957, Italy became a partner in the European Common Market.

The Christian Democrats have been in power since World War II, but in recent years, the Italian Communist party has been making major gains at the polls. The Communist party has taken advantage of the country's worst and longest recession since the war. In the June 1976 national elections, the Communists gained their most important parliamentary role since the formation of the republic.

Relations with the Pope. The occupation of the city of Rome by Italian troops in 1870 and the making of this city the capital of the Kingdom of Italy suppressed the temporal powers of the pope. The papacy was unreconciled to this loss. Improved relations between the "Vatican" and "Quirinal," effected by the Fascist administration, led to the signing, on February 11, 1929, of 3 treaties whereby the Italian government recognized the full independent sovereignty of the pope over the City of the Vatican.

Italia Irredenta. The unification of Italy, 1861–70, did not succeed in uniting to the kingdom the entire population subject to Austria. Considerable territory remained 'unredeemed." Italy entered World War I with the object of securing these territories under guarantees from the Allies through a treaty signed at London in 1915 with Great Britain, France, and Russia. The political situation was altered at the end of the war by the disintegration of the Austro-Hungarian Empire and by the demands of the kingdom of Yugoslavia. As a result Italy secured only some strategic points on the Dalmation coast. After World War II, by the treaty of 1947, Italy lost to Yugoslavia all its territory east of the Adriatic. Trieste, with its surrounding territory, was made a free port under the jurisdiction of the United Nations but subsequently with jurisdiction divided between Italy and Yugoslavia. Italy's frontier with France was "rectified," and the Dodecanese Islands were ceded to Greece.

Former Colonies. Before World War II Italy had a considerable colonial empire in Africa. The first acquisitions, in 1885, were Eritrea, on the Red Sea, and Italian Somaliland, on the Indian Ocean. Italian Libya, on the Mediterranean Sea, was taken from Turkey by conquest in 1911. Italian Somaliland was enlarged by the cession of a part of Kenya by Great Britain in 1924. Ethiopia was conquered and annexed in 1936. Albania was annexed in April 1939. Ethiopia was liberated by the British in 1941. Albania had driven out the Germans and set up a provisional government by the end of 1944, and in 1946 was proclaimed a republic. Eritrea was federated with Ethiopia in 1952.

IVORY COAST

Formerly a French territory, Ivory Coast voted in 1958 to become independent and remain outside the French Community. Under a constitution adopted in 1960, it declared itself a republic. It has a National Assembly of about 65 members elected by universal suffrage for a 5-year term from a one-party slate. There is a popularly elected president, who also serves for 5 years. He is the chief executive officer and may initiate legislation in the Assembly. In the event of his death in office, the president of the Assembly names a successor from that body. Laws become effective 15 days after transmittal to the president, who, however, may within the period return them to the Assembly for reconsideration or submit them to a referendum of the people.

JAMAICA

Jamaica, independent since 1962 and a member of the British Commonwealth, is a constitutional democracy with a government modeled on that of Great Britain. Parliament consists of a governor-general as representative of the sovereign, a Senate of 21 members, and House of Representatives of 45 to 60 members.

The House of Representatives is elected by universal suffrage for a 5-year term. The leader of the majority party is prime minister. Members of the Senate are appointed by the governor-general, 13 on the advice of the prime minister and 8 on the advice of the leader of the opposition. The governor-general has powers of veto, in which he may be advised by a privy council of six members whom he selects, two being present or former office holders.

JAPAN

According to Japanese records, Japan is an ancient monarchy, dating from the emperor Jimmu Tenno (B.C. 660). In the 16th century, when foreign intercourse began through the Dutch and the Portuguese, Japanese civilization had acquired its characteristic forms. Government was organized in a feudal system. The territory was divided among great lords, *daimyos*, possessing military retainers, *samurai*, and owing allegiance to the emperor at Kyoto but virtually independent and frequently at war with one another. Actual central power was exercised in the emperor's name by a succession of rulers called the shoguns. By one of these, in the early part of the 17th century, foreign intercourse, which at first had been welcomed, was prohibited and Japan remained closed to the outside world until the arrival of the American naval mission under Commodore Perry in 1853.

The "opening" of Japan was followed by the overthrow of the "shogunate," the restoration of the emperor, and the introduction in 1868 of a new period of progress called the era of Meiji or enlightenment. From that began a process of "Westernization" by means of which Japan transformed itself from feudalism to modern industrialism without such bloody revolutions as occurred when France, Russia, and China passed through a similar transformation.

A constitutional movement followed upon the "restoration." The feudal daimyos surrendered their powers; experiment began with quasi representative institutions. A constitution was promulgated in 1889, and in 1890 the first Imperial Diet, or representative legislature, convened.

The Meiji Constitution. By this constitution the emperor was sovereign, of divine descent, his person sacred. He both governed and legislated. He was apt to be guided by a small body of councilors, the *Gen Ro*, elder statesmen, who had no constitutional status but very great influence.

The Diet was composed of a House of Peers and a House of Representatives. The peerage was reorganized with European grades and titles. A law of 1925 diminished the number of peers in the upper branch and admitted a number of commoners selected by the emperor. At the same time, universal manhood suffrage was introduced. The lower house was elected for 4-year terms.

In theory, government was by a responsible ministry, but the Diet could not control the budget, the ministers of war and navy must be officers in service, and the privy council, an elderly and conservative body, could effectively oppose the ministry. This central government showed German influence. The local government was rather on the French model, with prefectures, districts, and towns governed by appointed officers, and controlled from above. Finally, the industrial revolution had created a group of influential families, the *Zaibatsu*, who controlled the economic life of Japan and influenced its politics.

Rise and Fall of the Empire. A long period of imperial expansion followed in the course of which Japan acquired Formosa, Korea, the southern half of Sakhalin, Port Arthur, and, as mandates after World War I, the former German Pacific islands north of the equator. In 1931, Japan seized Manchuria and conquered much of China. She began World War II by challenging the United States as a world power and quickly overran British, Dutch, French, and American dependencies in southeast Asia, proposing to organize them into a "co-prosperity sphere." Then came defeat, loss of the empire, and a new form of government.

The New Constitution. Under the terms of surrender in August 1945, Japan was allowed to retain her emperor but without his claim to divine authority. A constitution adopted in 1948 declares that the "emperor shall be the symbol of the state and of the unity of the people, deriving his position from the will of the people with whom resides sovereign power." All his governmental powers must be exercised on the advice and approval of the Diet, over whose acts he has no power of veto. In this respect, he resembles the British monarch. The Shintu religion is disestablished.

Testimony to Japan's reversal of its military past is the unique provision of the constitution by which Japan renounces war and forbids the maintenance of land, sea, and air forces. This is to be understood in the light of the umbrella which the strength of the United States held for her protection in the post-war period.

The sole lawmaking body is the bicameral Diet. The House of Representatives is elected by universal suffrage for 4 years, unless sooner dissolved. The House of Councilors is elected for 6 years, one-half retiring every 3 years. Laws require the consent of both houses, but the lower house may overrule the upper by a two-thirds vote. The prime minister is chosen by the Diet. He and a majority of his colleagues must be members. The cabinet is responsible to the House of Representatives. If it loses their confidence it must resign, or dissolve the House and order new elections.

The supreme judicial body is the supreme court. Judges of the supreme court are appointed by the cabinet and must, on their appointment and every 10 years thereafter, receive popular approval. The independence of judges is guaranteed, but they may be impeached. The supreme court may pass on the constitutionality of a law. The Diet alone may levy taxes and make appropriations. Local public entities elect their own assemblies and generally manage their own affairs.

The constitution guarantees civil rights, including freedom of speech, religion, assembly, collective bargaining, and academic teaching. Marriage is to be based on equal rights of the sexes in property rights, domicile, and divorce.

The constitution can be amended by a two-thirds vote of each house of the Diet and must be ratified by popular vote.

JORDAN

The kingdom of Jordan, formerly a part of the British mandated territory of Palestine, became independent by a treaty with Britain in 1946. Under the constitution of 1952, it is designated as the Hashemite Kingdom of Jordan. The king has an unusually large measure of control over the government. He appoints the 30 members of the upper house of parliament and designates its president. Members serve for 8-year terms. The king appoints the prime minister and other ministers and may dismiss them. The king may dissolve the lower house—the council of representatives—and thereby bring about another election, this 60-member body being elected by male suffrage. The king's veto of bills may be overridden by a two-thirds majority of each house. He appoints and may dismiss judges. The constitution may be amended by two-thirds vote in each house but cannot become effective without the king's signature.

KENYA

The former British East Africa, Kenya became independent in 1963 under an interim charter of 1963. At the end of 1964, the government declared itself a republic within the British Commonwealth. Legislative power resides in Parliament, consisting of a Senate and a House of Representatives. Members of the Senate elected by universal suffrage from districts for a term of 6 years. Members of the House are popularly elected in part, from 110 to 130 constituencies, and these members choose other members, numbering 10 per cent of those popularly elected.

The president, who must be a member of the House, is chosen by the elected members of the House. The president chooses ministers from both houses and appoints a vice president from ministers who are elected members of the House. Bills introduced into Parliament require his prior consent.

KOREA

Korea was a kingdom from 668 A.D. until it was annexed by Japan in 1910. It was freed in 1945 by Russian and American forces, who divided it for military convenience at the 38th parallel of latitude.

North Korea. Under the constitution of 1972 a supreme people's assembly is elected every 4 years by universal suffrage. The assembly elects a premier who is the official head of government. In effect, the country is ruled by the Korean Workers' (Communist) party which elects a central committee. The central committee appoints the ruling politboro. The secretary-general of the party serves as president and head of state.

South Korea. The South Koreans, in 1948, adopted a republican constitution under which the elected president ruled without a cabinet. North Korea invaded the country in 1950, but was driven back by UN forces, chiefly U.S. and South Korean troops. Under a 1972 constitution the president is given wide powers. He is elected to a 6-year term by a national council for unification, which is elected by direct popular vote. The president may be re-elected for a limit of 3 consecutive terms. One-third of the members of the national assembly are appointed by the president; the others are popularly elected. The national assembly consists of no more than 250 members.

KUWAIT

From 1899 until 1961 this oil-rich monarchy was under the protection of Britain. A constitution was then proclaimed in 1963. Its provisions included the establishment of a 50-member national assembly, the members of which are to be elected. The ruler of Kuwait is the amir. There is also a crown prince, prime minister, and deputy ministers for information, foreign affairs, and oil production. Kuwait joined the Arab League in 1961.

LAOS

Formerly a part of French Indo-China, Laos became a constitutional monarchy in 1947 and an independent sovereign state within the French Union in 1949. In 1973 an agreement was signed ending the war which the Royal Lao government and the Communist Pathet Lao had been fighting since 1953 and establishing a coalition government. In 1975, following Communist victories in Cambodia and Vietnam, the Pathet Lao took control of the entire country. A 264-member people's congress voted to end the 600-year-old monarchy and proclaimed a people's democratic republic. The Pathet Lao control the provincial administration with orders coming from the central committee. There is a president, prime minister, and 4 deputy prime ministers. Political disorders continue.

LEBANON

The republic of Lebanon was for 20 years after World War I a mandated territory of France. It was granted independence in 1941, and in 1944 powers formerly exercised by France were transferred to the Lebanese government. Lebanon became a member of the UN and of the Arab League.

The republic's first constitution, which has been amended, was adopted in 1926 when Lebanon was still under the French mandate. The executive branch consists of a president and a prime minister, with a cabinet appointed by him. There also is a single-chamber legislature, elected by universal adult vote, and an independent judiciary. An electoral law allocates deputies according to the religious distribution of the population. According to the constitution the president is to be a Maronite Christian, the prime minister a Sunni Moslem, and the speaker of the chamber a Shia Moslem. There are distinct religious divisions in Lebanon's political, geographic, and social structures.

A civil war erupted in Lebanon in April 1975. Despite the religious compromise proposed in the constitution, Lebanon's government has been unable to handle the problems created by a multi-religious society. Also there have been increased tensions and military confrontations resulting from the Arab-Israeli conflict.

LESOTHO

Formerly the British protectorate of Basutoland, Lesotho is surrounded by the Republic of South Africa. A constitutional monarchy, it has a government headed by a prime minister. In 1965 the constitution set up a bicameral parliament consisting of a national assembly, with 60 elected members, and a senate with 22 chiefs and 11 other members appointed by the king. Lesotho became independent and joined the UN in 1966.

LIBERIA

This republic on the west coast of Africa was founded July 26, 1847. A constitution was adopted the same year. The country is still governed under this constitution, with a few amendments, although the actual government is far from extending throughout the entire country, the vast majority of the population continuing under tribal rule.

Liberia is almost alone among modern countries in requiring ownership of real property as a qualification for voting. For the hinterland, possession of a hut is sufficient. The constitution in general is modeled on that of the United States. The presi-

dent and a vice president are elected directly by popular vote of qualified citizens over 18 for an 8-year term. The president has a limited right of veto over bills passed by Congress, which can be overridden by a two-thirds vote of each house. The constitution authorizes removing from office those in authority who become oppressors, but the manner of doing so is not prescribed. The president is assisted by a cabinet chosen with the advice and consent of the Senate.

Congress consists of (1) a Senate of 18 members elected for 6-year terms, but 3 or 4 of the members must run for re-election each 2 years and (2) a House of 71 members elected for 4-year terms. Two senators are elected from each county, while the number of congressmen elected from each county is roughly proportional to its population except that each of the three provinces in the hinterland is entitled to one only.

LIBYA

The Kingdom of Libya comprises the former Italian colony of Libya. For centuries it was under the rule of the Turkish Ottoman Empire until the Italians occupied it in 1911. During World War II the administration of Libya was taken over by Britain and France, the British controlling the provinces of Tripolitania and Cyrenaica, the French that of Fezzan. In 1949 the UN stated that Libya should become a sovereign country by 1952. A constitution was adopted, and in December 1951, King Idris I, who had been recognized in 1949 as Amir of Cyrenaica, proclaimed the country's independence. Before 1963, Libya had been a federal state consisting of three provinces, each administered by a governor. In April 1963 the federal system was abolished and comprehensive unity declared. The king was deposed by a group of army officers in September 1969. Some of the officers established the revolutionary command council. The 10-member council rules Libya with the assistance of a cabinet, which is mainly civilian. There is a chairman of the council and a prime minister. The country is divided into 10 divisions, each administered by a commissioner.

LIECHTENSTEIN

This Alpine principality of 65 square miles is a hereditary monarchy, succession being in the male line only. There is a Diet of 15 members, elected by universal suffrage. Voting is direct and election is by proportional representation. An administrator for the state is appointed by the prince. There is a high court.

From 1867 to 1918, the principality was dependent on Austria, but the Diet proclaimed the complete independence of the state in 1918. Nevertheless, by treaty of 1920, Switzerland took over its diplomatic representation and administration of its postal and telegraph systems. In 1923, it was incorporated in the Swiss customs union.

LUXEMBOURG

This constitutional monarchy, known as a grand duchy, bordering on France, Belgium, and Germany, was given its rank as a principality by the Congress of Vienna in 1815. By the Treaty of London (1867), it was neutralized and its integrity and its independence were guaranteed. But, having been invaded and occupied by German armies in 1914, it abandoned neutrality and aligned its policies with Belgium.

The monarchy is heritable by either male or female heir. The present constitution is that of 1868 with later amendments. In 1919, universal suffrage was introduced with proportional representation of parties in the legislature.

The unicameral legislature, the Chamber of Deputies, consists of about 55 members elected for 5-year terms, barring prior dissolution of the Chamber. The grand duke has no veto power over bills, but he may dissolve the Chamber. He is assisted by a cabinet of members appointed by him, who may not be members of the Chamber. They may, however, introduce bills in behalf of the grand duke and may be called into attendance by the deputies. The grand duke is assisted also by a council of 21 members appointed by him for life. The legislature may also call on the council for advice on legislation. Local government is by popularly elected community councils headed by a mayor appointed by the grand duke. In order to amend the constitution, it is necessary for the Chamber to so resolve, whereupon it is dissolved, and a new Chamber is elected. This body, with at least three-fourths of its members present, must uphold the proposal by a two-thirds vote in order to make it valid.

MALAGASY (MADAGASCAR)

This former French colony is a member of the French Community. In October 1958 Madagascar was proclaimed a republic and became known as the Republic of Malagasy. A second republic, the Malagasy Democratic Republic, was proclaimed in December 1975. Malagasy was admitted to the UN in September 1960. It is located off the southeast coast of Africa.

The constitution of 1959 provided for a national assembly, senate, president, and ministers; however, the government was dissolved in May 1972, and in October, a provisional constitution was declared. A national military directorate was created in February 1975. In June of the same year, the military directorate was terminated, and the supreme revolutionary council formed. Didier Ratsiraka was declared president and head of the council. A socialist state was established; Ratsiraka nationalized banks, insurance companies, and movie theaters. The council, composed of 9 members, is the policy-making body of the government and supervises the activities of government ministers. In a referendum in December 1975 voters supported the Ratsiraka regime, gave him the power to rule by decree for 18 months, approved a 7-year term for the leader, and approved a new constitution. In January 1976 Ratsiraka was sworn in as president of the Malagasy Democratic Republic. He then appointed a premier.

MALAWI (NYASALAND)

Malawi, formerly the British protectorate of Nyasaland, became an independent state within the British Commonwealth on July 6, 1964. It had been granted self-government in February 1963. Hastings Kamuzu Banda was sworn in as prime minister, and a cabinet and parliament were created. On July 6, 1966, Malawi was declared a republic within the Commonwealth and Banda sworn in as the first president. The president is head of government and of the Malawi Congress party. Banda became president for life on July 6, 1971—a constitutional amendment in 1970 established the new position. The functions and authority of the presidency have increased since 1970. Banda assumed some cabinet posts in 1972 and 1976 and took control of the press and communications in 1973. A 12-member cabinet was appointed in 1976. Malawi is a one-party republic. Parliament is composed of 60 elected members and 15 nominated members. The country is divided into 3 regions and 24 districts, each administered by a district commissioner. Malawi lies along the western and southern shores of Lake Malawi in southern Africa.

MALAYSIA

Government

A "federal constitutional monarchy" formed from 13 former British dependencies. Nine of them had become independent in 1957 as the Federation of Malaya, each being ruled by a hereditary sultan. To this federation were added two former British Straits Settlements (Penang and Malacca). Singapore with Sarawak and North Borneo adhered until 1965, when Singapore withdrew, claiming to take Sarawak and North Borneo with it. The official religion is Moslem.

Under a constitution adopted in 1963, the "monarch," known as the supreme head of the federation, and a deputy to act in his absence are chosen for 5-year terms by a conference of rulers, consisting of the heads of the federated states. He, with the deputy, must be a head of a state and on election relinquishes his rule over the state, except that part of it relating to religious matters.

Parliament consists of a Senate and House of Representatives. The Senate consists of members elected by each state legislative assembly and members appointed by the federal head of state for their distinction and their capability of speaking for minorities and the aborigines. The term of office is 6 years. Parliament may, by majority vote, provide for election of all senators by popular vote. The Senate is not subject to dissolution. The House consists of members elected by universal balloting from the different states roughly in proportion to their population.

The supreme head of state appoints the prime minister, who is responsible to the House, and also the other ministers on the prime minister's recommendation.

MALDIVE ISLANDS

There are 2000 islands in this Indian Ocean group, 220 of them inhabited. Except briefly in 1953, the islands were a sultanate until the establishment of republican government by the constitution of 1968. A president, elected for a 4-year term heads the government. Election to the unicameral legislature is by popular vote—there are 54 members. The islands became independent and joined the UN in 1965. British rights to an airbase in the islands expire in 1986.

MALI

Formerly the territory of the French Sudan, the Republic of Mali became independent in September 1960. It is in the western portion of north Africa. The constitution of 1960 provided for a national assembly of 70 members elected by universal vote for a 5-year term and a president elected by the assembly. In November 1968 the president was overthrown by a bloodless military coup. A liberation committee took control of all political and administrative functions, and Yoro Diakite assumed the position of president. In September 1969 Moussa Traore replaced Diakite as chief of state and head of the government. A new constitution was approved by popular vote in June 1974. It stated that the liberation committee would define national policies and supervise the government for the next five years. It also provided for the election by universal vote of a president and the establishment of a national assembly and a single political party.

MALTA

This strategic Mediterranean island has been victim to economic strain and political unrest since the withdrawal of British forces—completed in 1969. Malta became a republic in 1974 within the Commonwealth. The ruler of England, represented by a governor-general, is head of state, while the government is headed by a prime minister. The single-chamber house of representatives has 55 members, elected for 5-year terms. Malta's constitution became effective in 1964.

MAURITANIA

A former French territory which became an independent Islamic republic in 1960, electing to remain within the French Community. The president, who must be of the Islamic faith, is elected by universal suffrage for a 5-year term, as are also members of the National Assembly. The president as well as assemblymen can initiate bills in the legislature. He appoints the ministers. He can exercise a suspensive veto of bills by sending them back for reconsideration within 15 days but otherwise must promulgate them.

MAURITIUS

This Indian Ocean island is a parliamentary state within the British Commonwealth. The head of state is the British sovereign, represented by a governor-general. The single-body legislature has a speaker and members elected to 5-year terms by universal vote.

MEXICO

Mexico is a federal republic with a constitution modeled on that of the United States but with a number of modifications directed toward avoidance of abuses in its history since its independence from Spain in 1821. Rivalry between imperial and republican proponents took the form of frequent civil war until the adoption of a liberal republican constitution in 1857, which was temporarily in eclipse during 1864–67, an emperor, Maximilian, having been imposed by French power. Mexico's liberator, Diaz, held the presidency continuously from 1876 to 1911, when he was overthrown. A new constitution was adopted in 1917 designed to prevent a long rule, such as that of Diaz, and to break up the landed aristocracy upon whose power Diaz depended.

The national government is entrusted to a president and a bicameral legislature—Senate and House of Representatives. The Senate consists of 60 members, 2 from each state and the federal district, elected by universal suffrage for 6-year terms. The House consists of one deputy for each 170,000 inhabitants. Deputies are chosen for 3-year terms. No member of Congress may succeed himself. Bills may originate from either house and also from the president and from state legislatures. The president may veto a bill but the veto may be overridden by a two-thirds vote of both houses. Suffrage may be exercised by citizens who are 18 or older and have an honest means of livelihood.

The president is elected by universal suffrage for a 6-year term. If the office becomes vacant in the first 2 years, Congress elects an interim president and calls a new election for a president to complete the term. A vacancy in the last 4 years is filled by a new president elected by Congress for the balance of the term. The president has sole discretion in the choice and dismissal of his cabinet. In no case may a president serve more than one term.

There is a supreme court of 27 members appointed by the president and subject to Senate approval within 10 days.

Ownership of land is restricted to Mexican citizens or to foreigners only if they agree to be bound therein as citizens. No commercial company may own rural real estate. Electric power may be developed and distributed only by the federal government. Religious institutions are forbidden to own land.

MONACO

A tiny principate which, except for a small strip of Mediterranean coast, is entirely surrounded by French territory. The state is the private possession of the prince, and was governed autocratically until January 7, 1911, when a constitution was granted. This constitution was suspended in 1959 by the prince and was replaced in 1962 by another which recognizes the hereditary monarchy, although the reigning prince renounced his "divine right" to rule. A legislature of two houses is provided—the National Council of 18 members and the Communal Council of 16 members, both elected by universal suffrage.

Representation on a popular basis is accorded to Monaco, La Condamine, and Monte Carlo, the three "communes" which comprise the principate. Public revenue and the income of the prince are derived almost entirely from the concessions to gambling establishments.

MONGOLIA

The Mongolian People's Republic won independence from China in 1921 with Russian help, and is now a Soviet satellite. It has a one-party system with an elected assembly meeting at least every 3 years; 30 members form an executive committee, which selects a presidium of 7 as an interim body. A cabinet of 10 ministers chosen by the executive committee governs. The political leader is the secretary of the Communist party; the head of state is chairman of the presidium. Mongolia's present constitution dates from 1960.

MOROCCO

Prior to 1956, what is now the constitutional monarchy of Morocco was, from 1912, divided into a French protectorate and a British protectorate, the area of Tangiers being from 1923 an international zone. The ruler was a sultan. Its independence was recognized in 1956, and the sultan, Mohammed V, changed his title to king. While retaining the supreme religious authority which was his as sultan, he planned to share his political authority under a constitution framed by himself. His son, Hassan II, submitted a constitution to referendum by universal suffrage in 1962, and it was approved by an overwhelming majority.

The crown descends in the male line. The king appoints the prime minister and other members of the cabinet and may dismiss them. He presides over meetings of the cabinet, the supreme court, and the supreme council for national reconstruction and planning. The legislature consists of a Chamber of Representatives and a Chamber of Councilors. Representatives are elected by universal suffrage for a 4-year term. Councilors are elected for a 6-year term, one-half renewable each 3 years, by an indirect method. Two-thirds are chosen by an electoral college consisting of town, provincial, and county councils; the remaining third are elected by chambers of commerce, industry, arts and crafts, and delegates from labor unions. Only members of the electoral college, chambers of commerce, or unions are eligible.

MOZAMBIQUE

Mozambique is located on the southeastern coast of Africa. Vasco da Gama discovered Mozambique in 1498; it was first colonized in 1505. In 1951 Mozambique became an oversea province of Portugal.

With the rise of the black African nationalist movement, Eduardo Mondlane founded the Front for the Liberation of Mozambique in 1962. Operating from headquarters in Tanzania, the independence movement began to wage guerrilla warfare in 1964. Mondlane was assassinated in Dar es Salaam in 1969, and leadership was passed on to his assistant, Samora Moises Machel. In 1972 Mozambique became an overseas state of Portugal. In April 1974 a military coup overthrew the Portuguese regime. After a decade of fighting between guerrillas and Portuguese troops, a transitional Portuguese-Liberation Front government, led by Joaquim Chissano, was established in September 1974.

On June 25, 1975, after 470 years of Portuguese colonial rule, the People's Republic of Mozambique achieved full independence. Machel became the country's first president. The one-party state, dedicated to Marxist-Maoist ideology, was to be ruled by central, political, and military committees, with the liberation front supreme over both the government and army. The black administration called for the nationalization of land, the establishment of collective farms, and the eradication of tribalism, regionalism, and racism.

Mozambique was admitted to the UN and the Organization of African Unity, and established diplomatic relations with the U.S. Since independence, groups have been formed in opposition to the country's austerity program and its many economic problems persist.

NAURU

Called Pleasant Island by its American discoverers in 1798, Nauru was renamed when annexed by Germany in 1888. It was administered by an Australian-New Zealand-British mandate after World War I. The island is now a republic, headed by a president elected by the legislature and assisted by a 4-man cabinet. The 18 members of the unicameral assembly are popularly elected. In 1968, when Nauru became independent, the natives rejected Australian protection and political direction in foreign affairs.

NEPAL

This Hindu constitutional monarchy owes its long history of independence largely to its rugged terrain in the Himalaya mountains between China and India. Prior to 1951, the king was a puppet, and the country was ruled arbitrarily by a hereditary prime minister belonging to the Rama family. In that year, the power of this family was broken and the king established his authority. He proclaimed a constitution in 1951 under which there was an elected Congress and a cabinet. In 1959, the king dissolved Congress and assumed sole leadership. Three years later, he promulgated a new constitution, which, however, he may revoke in an emergency.

The constitution of 1962 provides for a National Congress, partly indirectly elected and partly appointed. There are 112 elected members, their electors being zonal congressmen elected by district congressmen, who in turn are elected by village and town congresses, recognized as the basic units of democracy. Appointed members of the National Congress comprise 23 representatives of professional organizations and university graduates, and royal nominees not exceeding 15 per cent of the elected members.

NETHERLANDS

The Dutch nation arose in the 16th century by the revolt of the provinces of the "low countries" against Spain. In 1579, the provinces of Holland, Zealand, Utrecht, Gelderland, Groningen, Friesland, and Overyssel joined to form the 'United Netherlands" under the prince of Orange as governor, or *stadthouder*. The remaining provinces were resubjected to Spanish authority and experienced a different fortune. In 1830, they united to form the present kingdom of Belgium.

In 1815, the Netherlands was reconstituted as a sovereign state and was raised by action of the "great powers" to the rank of a kingdom. The constitution was promulgated in 1814, was revised in 1815 after the addition of the Belgian provinces, in 1840 after their secession, in 1848, and 10 times thereafter. In 1917 an electoral reform act provided for universal suffrage and for proportional representation.

The royal succession is the direct male line of descent from Prince William of Orange. In default of male heirs, the female heir becomes queen.

The legislative body is known as the States General and comprises a First Chamber of 75 members elected by the provincial legislatures for a term of 6 years, one-half retiring each 3 years, and of a Second Chamber of 150 members, chosen for 4 years by citizens of both sexes above 18 years of age on a system of proportional representation. Voting is compulsory. Both men and women of the age of 25 are eligible for election to the States General. Initiation of laws is restricted to the government and to the Second Chamber, the First Chamber having power only to approve or to reject but not to amend. The sovereign may dissolve either or both chambers, in which case a new election must take place within 40 days and the first session be held within 3 months.

Government is conducted by the sovereign and by a council of ministers, one of whom is appointed president of the council. There is also a "state council" of 16 members, appointed by the sovereign. The sovereign presides over this council, which has consultative participation in both legislative and executive matters.

The Provinces. The 11 provinces of which the Netherlands is composed are North Brabant, Guelders, South Holland, North Holland, Zealand, Utrecht, Friesland, Overyssel, Groningen, Drenthe, and Limburg. They have a large autonomy and (subject to the veto of the sovereign) a local legislative power which is exercised through assemblies, "the provincial states," chosen for 4 years by the same electors as choose the national second chamber. These bodies meet twice annually, and in the intervals between sessions they are represented by permanent commissions, or "deputed states," of 6 members, who administer the affairs of the provinces and oversee the execution of the laws. A commissioner appointed by the sovereign presides over both the provincial states and the deputed states, and in the latter body has a deciding vote.

The Dutch "communes," or municipal corporations, number over 1100 and are governed by councils chosen by the same electors, residents in the commune, as choose the national Second Chamber. The by-laws of the council are subject to the veto of the sovereign. The municipal budgets and all proposals to alienate municipal property must receive the approval of the provincial states.

Further central control is exercised through the mayor, who is a state as well as a municipal officer. The police are under his authority, and he has a suspensive veto on resolutions of the council for 30 days, during which time the provincial states must be advised. The municipal executive power is intrusted to the mayor and to a commission of aldermen, 2 to 7 in number, elected by the council. This commission is a body analogous to the "college of echevins" of the Belgian commune.

Dutch civil and criminal law is based on the Roman law and reflects its principles. Trial by jury is unknown. There are a high court of the Netherlands (court of cassation), 5 courts of appeal, 19 district tribunals, and 62 cantonal courts. The cantonal courts deal with minor offenses and have one judge each. All judges, 3 in number for appeal and district courts and 5 for the high court, are appointed by the sovereign for life. They can be removed only by a decision of the high court. There are also juvenile courts, presided over by one judge unless the penalty may be 6 months or more of imprisonment, in which case there are 3 judges.

Colonies. Previous to World War II, the Netherlands possessed a vast colonial empire, the acquisition of which dated from the 17th century. But in 1965 its overseas territories included only Surinam, or Dutch Guiana, on the northeast coast of South America and the Netherlands Antilles in the Caribbean Sea, comprising two groups of three small islands each, about 500 miles apart.

The Netherlands Antilles is constitutionally the equal of the Netherlands, the Dutch sovereign being represented by a governor. The latter is assisted by a cabinet responsible to the legislature of 22 members elected for a 4-year term by universal suffrage. The country consists of the Windward Islands (Curaçao, Aruba, and Bonair) and the Leeward Islands (St. Eustatius, Saba, and part of St. Martin). Each island has control of its own affairs, but in the common interest sends elective representatives to the *Staten* (legislature). The governor has charge of the colony's external affairs, while the executive power in general internal matters is vested in the cabinet responsible to the legislature.

NEW ZEALAND

This constitutional monarchy was from 1840 until 1852 a British colony. In the latter year it was granted responsible government. As a self-governing dominion it formed part of the British Empire and later the British Commonwealth of Nations, as the latter organization was defined in the British Statute of Westminster Act of 1931. Nevertheless, New Zealand was slow in accepting its role as an independent country within the Commonwealth. It adopted this Act in 1947.

New Zealand does not have a formal constitution. Its mode of government rests on ordinary laws which may be repealed as such, with the exception of 6, which by their terms can be repealed only by a three-fourths majority. Of these 6, 3 relate to the formation of electoral districts, one provides for a secret ballot, one fixes the term of Parliament at 3 years, and the last fixes voting age at 21. Women were first permitted to vote in 1893.

The monarch of New Zealand is the British monarch, who, when not in New Zealand, functions through a governor-general appointed by the British crown on the advice of its New Zealand ministers. The governor-general is assisted by an executive council, a body consisting of the prime minister and 14 other cabinet members. He is not necessarily bound by its advice but, if he disagrees, refers the matter promptly to the crown. Parliament consists of the governor-general and the General Assembly of 80 members elected by universal suffrage for a 3-year term unless dissolved earlier. Four members must be of the Maori race from Maori election districts. Members of the cabinet must be members of the majority party in the Assembly. Orders-in-council (executive orders) are issued by the executive council pursuant to or in conformity with laws, but the Assembly acts as a watchdog over them through a statutes revision committee, which is charged with the duty of calling the Assembly's attention to orders which appear to trespass on individual liberties, to make unexpected use of statutory authority, or to require clarification. The Assembly may bring about the resignation of the cabinet by passing a resolution of no confidence or rejecting a vital proposal of the government, but this does not necessarily entail dissolution of the Assembly, this being in the discretion of the governor-general.

In addition to the hierarchy of regular courts, New Zealand has a court of arbitration concerned with awards and general orders governing wage determinations and employment in industry.

NICARAGUA

In 1971 congress voted to dissolve the constitution of 1962; a constituent assembly was formed in 1972 to draw up another constitution. A new constitution was adopted in 1974. It calls for a president to be elected directly by universal vote. Neither he nor any relative of his may run for reelection. The president chooses his own ministers—they cannot be members of congress. The 1974 constitution provides for a two-chamber national congress with a 30-member senate and a 70-member chamber of deputies.

NIGER

The republic of the Niger, formerly a part of French West Africa, became independent in 1960. It voted to adhere to the French Community. In April 1974, after a military coup, the president was overthrown, the constitution suspended, and the national assembly dissolved. A military assembly with Lt. Col. Seyni Kountche as president was formed to assume the government. In 1976 Kountche added civilians to the assembly.

NIGERIA

Nigeria became independent in 1960 after more than half a century of British rule. It is a republican federation of 12 states. In 1966 the government was overthrown by the army; the constitution was suspended. After another coup in 1975 and the assassination of the head of state in 1976, moves were made toward civilian rule. A 26-member federal executive council, consisting of civilians and military officers, was formed; local elections were held.

NORWAY

By the Congress of Vienna, 1814, Norway was united to Sweden under the sovereignty of the Swedish king. The union was personal in the monarch, each country retaining its own nationality, government, and laws. On June 7, 1905, Norway declared this union dissolved, and an accord to this effect was signed with Sweden in October 1905. Public opinion in Norway, to a certain extent, inclined toward a republic; but reasons of policy appear to have prevailed over the naturally democratic instincts of the Norwegians, and, by a plebiscite, the throne was offered to Prince Carl of Denmark, who took the title of Haakon VII. The constitution of Norway is that which has existed since May 17, 1814, with a number of amendments. The executive power resides in the king, who acts through ministers responsible to the Norwegian parliament. Before 1913, the king had a qualified veto over legislation. In that year it was made suspensive, that is, a measure passed by three successive parliaments formed by separate elections becomes law without the royal assent.

The national legislature, called the *Storthing*, is elected by universal suffrage of all Norwegians over 21 years of age. The election of the Storthing, which numbers 150 members, takes place every fourth year, is direct, and according to proportional representation. Upon assembling, each Storthing divides itself into two bodies, one called the *Lagthing*, composed of one-fourth of the membership. The remainder form the *Odelsthing*. These two bodies ordinarily act as separate houses; but, in the case of disagreement, they meet in a joint session and a final decision is reached by a majority of two-thirds of the voters. An amendment to the constitution in 1913 gave to ministers the right to sit in the Storthing, but without a vote.

For local government, the country is divided into 20 districts; 2 of them, the cities of Oslo and Bergen, are urban, and 18 of them are rural counties, or *fylker*. The chief executive, or *fylkesmann*, is appointed by the crown. Districts are governed by elective councils with a membership of from 13 to 85, while the administration is conducted by an administration council chosen from among the representatives. In local government, women with property qualifications gained the vote and the right to representation in 1901. In 1910, their suffrage became the same as that of men.

Justice is administered by 106 district courts with 5 higher tribunals and a supreme court, all of which handle both civil and criminal cases. Criminal cases may be tried with or without a jury.

Dependencies. These include the Spitzbergen Archipelago, acquired in 1920, and Jan Mayen Island in the Arctic Ocean; Bouvet and Peter I islands, in the Antarctic; and a section of the Antarctic continent southeast of the Falkland Islands, ownership of which was claimed in January 1939.

OMAN

The Sultanate of Oman (formerly Muscat and Oman) was renamed on August 9, 1970. Conquered by the Portuguese in 1508, Oman revolted in 1650. Except for a period of Iranian invasion (1741–43), it has remained independent. The Sultanate of Muscat and Oman signed a treaty of friendship with Britain in 1798 and with the U.S. in 1833.

On July 23, 1970, the son of the reigning sultan staged a successful coup. Oman is a monarchy with no constitution, no legislature, and no legal political parties. The sultan is the supreme ruler, assisted by a cabinet. The country is divided into 10 regions. Local governors work through tribal authorities. The judicial system is based on Islamic law. The courts are administered by judges whom the sultan appoints. In remote areas, the law is based on tribal custom. Oman is a member of the Arab League and was admitted to the UN in 1971.

PAKISTAN

Before independence came in 1947, Pakistan was under British colonial rule, as a part of India. In 1956 it was proclaimed an Islamic republic within the Commonwealth of Nations. In 1970 the capital was moved from Karachi to Islamabad, West Pakistan, a new city built for the purpose.

Direct general elections were held for the first time on December 7, 1970. The Awami League won 149 seats out of 243, and immediately announced their goal of greater independence from East Pakistan.

Martial law was imposed in East Pakistan after disturbances in Decca. On March 25, 1971, Civil war erupted in East Pakistan when 70,000 troops of Pakistan's central government (in West Pakistan) launched widespread attacks. They were attempting to crush East Pakistan's growing nonviolent movement for self-rule. On April 1, the government of newly independent East Pakistan, now called Bangladesh (Bengali Homeland), proclaimed its sovereignty. Pakistan emerged a much smaller and weaker nation. In 1972, Pakistan withdrew from the Commonwealth of Nations.

Martial law, in effect in West Pakistan since 1958, when Marshall Khan established his military regime, was discontinued in April 1972. A new constitution—Pakistan's third in 25 years—went into effect in April 1973. Proclaiming Pakistan a federal Islamic republic, the constitution established the offices of prime minister and president and a two-chamber parliament. The upper chamber of parliament, the senate, was to have 63 members elected by the provincial assemblies. The lower chamber, the national assembly, was to consist of 200 directly elected men and women, plus 10 seats to be filled only by women.

The first election under civilian rule was held in March 1977. Election fraud was suspected, however, and opposition among the political parties threatened civil war. The army assumed control of the government in July. The 1973 constitution was to remain in effect and elections and civilian rule were scheduled.

PANAMA

The republic of Panama owes its independence to the United States. From 1821 until 1903, it was a part of Colombia. When the latter country rejected a proposed treaty with the United States for construction of a canal across the Panama isthmus within Colombian territory, the department of Panama declared its independence and was recognized 10 days later by the United States, which guaranteed the independence and internal order of the new republic of Panama. This guarantee was part of a treaty providing for construction of the Panama Canal and payment to Panama of a lump sum and later annuities. The annuity was originally $250,000 but was increased to $430,000 in 1936 and to $1,930,000 in 1955.

At Panaman request, the United States in 1936 withdrew its guarantee of independence. The original treaty excluded Panama from exercise of any sovereign rights in the Canal Zone, but, on the theory that this did not extinguish theoretical sovereignty, it was agreed that the Panaman flag might be displayed along with the American flag in areas under civilian control. An incident involving the tearing down of the American flag sparked a demand in 1962 for renegotiation of the treaty between Panama and the United States.

Colombia protested the action of the United States in supporting the independence of Panama in 1903 and refused recognition of Panama until 1914, when it agreed to extend recognition only if the United States paid it $25,000,000. A treaty so providing was ratified by the United States Senate in 1921, and diplomatic relations between Colombia and Panama were established in 1924.

The first constitution of Panama was adopted February 13, 1904. It was replaced by the constitution of 1946, which provided for a legislative national assembly with members elected for 4-year terms. Executive power was entrusted to a president elected by direct universal vote for a 6-year term. The assembly chose two vice presidents, and the president named a cabinet to assist him. The 7 provinces of Panama were administered by elected governors.

In 1968, after 11 days in office, President Arnulfo Arias was deposed. The assembly was suspended and replaced by a military-civilian coalition with power vested in General Omar Torrijos. In 1972 a new assembly of 505 members was popularly elected. Its members approved a new constitution calling for the indirect election of a president, vice president, and legislative council—but executive control was assigned to Torrijos for a transitional term of 6 years.

The laws dating from the period of union with Colombia were replaced in 1917 by new civil and criminal codes. Under these codes, capital punishment is prohibited. Foreigners are prohibited from mingling in politics and may be ejected from the country for criticism of public offices or institutions. The laws relating to mining, industry, and exploitation of land are favorable to foreign investment.

PAPUA NEW GUINEA

Papua New Guinea covers the eastern half of the island of New Guinea and includes many offshore islands, among them New Britain, New Ireland, and Bougainville. Papua New Guinea shares the island of New Guinea with the Indonesian province of Irian Jaya. Just north of Australia, most of Papua New Guinea has been a protectorate of that country since 1906, under mandates from the League of Nations and the UN. It achieved independence September 16, 1975, and became the 142nd member of the UN. A member of the Commonwealth of Nations, the country is governed by an elected assembly of 100 members, a prime minister and his cabinet, and a governor general who represents the sovereign of England. Papua New Guinea is divided into 19 districts. The capital is Port Moresby.

PARAGUAY

The republic of Paraguay, like Bolivia, is an inland country, possessing no seaboard on the South American coast. The country was settled by Jesuit missionaries. Paraguay, formerly part of the Spanish viceroyalty of La Plata organized in 1776, declared independence on August 10, 1811. A revolutionary government was established under two "consuls," but it rapidly dissolved into a dictatorship, which continued until 1870. Under the last period of dictatorship, Paraguay was involved in struggles with Brazil, Argentina, and Uruguay, which were ruinous in loss of life and territory.

The constitution of November 25, 1870, completely reorganized the government. It remained nominally in force until 1936, when a military clique seized the government. A strongly authoritarian constitution was adopted by popular approval in 1940. This was replaced by a new constitution in 1967.

By the 1967 constitution executive power is entrusted to a president chosen by popular vote for a term of 5 years; a vacancy is filled by the parliament. The president appoints his own cabinet and can govern by decree during parliamentary recess through the council of state, which is composed mostly of members from the government and armed forces. The president also has been granted wide powers to use in an emergency. A clause forbidding reelection of a president was removed by a constituent assembly in 1977. This was done to allow the reelection of Gen. Alfredo Stroessner, who seized power in 1954 and began a fifth term as president in 1973.

Legislative power is vested in a two-chamber parliament. There is a 30-seat senate and a 60-seat chamber of deputies. Two-thirds of the seats in each chamber are given to the majority party while the other one-third is distributed proportionately to the remaining minority parties according to the votes cast. All citizens over 18 are eligible to vote. Voting is compulsory.

At the head of the judicial system is a supreme court of 5 justices, appointed by the president and council. There also are chambers of appeal, lower courts, and justices of the peace. The attorney general handles all state legal matters.

By law the country is divided into two sections, the eastern, "Oriental" (east of the Paraguay River), and the western, "Occidental" (west of the Paraguay River). The Oriental section is divided into 15 departments. The departments are administered by officials appointed by the central government. The Occidental section is under military government.

PERU

The republic of Peru arose from the viceroyalty of Peru, which in the Spanish colonial period was considered the ranking kingdom of the New World. Here Spanish prestige and authority were more strongly entrenched than elsewhere. It was not until 1821 that Spanish authority was overthrown.

Peru became an independent republic July 28, 1821. The most recent constitution of Peru went into effect on April 9, 1933. It provided for a congress composed of a senate and a chamber of deputies. Political disturbances in 1936 led to a suspension of the constitutional government until November 14, 1939. Then a constitutional regime was restored but with amendments which tended to increase the power of the executive.

In 1968 a military junta took control of the government; congress was suspended. Rule presently is by decree. The government has stated that the existing constitution will be revised before new elections are held.

PHILIPPINES

The Republic of the Philippines came into existence on July 4, 1946. The Philippine Islands, discovered by Ferdinand Magellan in 1521, were a colony of Spain from 1565 to 1898, when they became a dependency of the U.S. after the Spanish-American War. The U.S. Congress granted the Philippines the status of a self-governing commonwealth in 1934. After a 10-year transitional period and a delay because of World War II, the Philippines achieved full independence.

The first constitution was adopted in 1935, modeled on that of the U.S. A new constitution ratified on January 17, 1973, has not yet been put into effect. Martial law was declared on September 23, 1972, by President Ferdinand Marcos, because of increasing violence on the islands. Virtually all legislative functions have been suspended and President Marcos's term has been extended indefinitely. Marcos announced in January 1976 that martial law would be in effect until at least 1980.

The constitution of 1973 called for a parliamentary system with a president as head of state and a prime minister as chief executive. Both are elected from and by a universally elected national assembly. Members of the assembly serve 6-year terms. The judicial system consists of a supreme court and lower courts. All judges are appointed by the president. The constitution also called for changing the name of the Philippines to Maharlika (a Tagalog word meaning "noble").

POLAND

Poland was a state of much influence and promise until it was weakened by serious factional troubles in the 18th century and fell prey to the more powerful neighboring states of Russia, Prussia, and Austria. In 1772, 1793, and 1795 occurred the three successive partitions of Poland whereby all the territory of the kingdom was divided among these three great powers. Napoleon, in return for military support, promised to reconstruct an independent Poland, but accomplished little.

After having been extinguished as an independent state by the partitions, Poland was reunited and was raised again to the rank of an independent state by World War I. The independence of the country was proclaimed and a provisional constitution was declared in 1918. Elections for a constituent assembly were held in 1919 and a constitution was finally adopted in 1921.

A new constitution was adopted in 1935 which provided for a high degree of centralization under the personal authority of a president.

The People's Republic of Poland was set up in 1947 under effective Russian control. During World War II, Poland was conquered by Germany, and a government in exile was recognized by Great Britain and the United States. When the German army was driven out by Russia, the latter set up and recognized a committee of national liberation. These were merged after the war, and an election was held while the Russians still occupied the country. The Communist party was swept into power, and it promptly set up a Communist-type government.

The present constitution, adopted in 1952, offers the unusual example of a republic without a president, his place being taken by a council of state.

The constitution declares that Poland is a people's democracy based on an alliance between the working class and the working peasants. The highest organ of state authority is the *Seym*, whose members are elected by universal suffrage for 4-year terms, one member for each 60,000 inhabitants. In practice, the candidates are selected by the Communist party, one candidate for each seat. It passes laws and exercises control over other organs of the state and adopts the national economic plans.

The Seym chooses a council of ministers, whose duty it is to guide the work of the Seym, present the economic plans, and also to insure the execution of laws and protection of public order. The members may be removed by the Seym and, between sessions, by the council of state.

The executive power lies, as already stated, with the council of state, the members of which are elected by the Seym from among its members. They consist of a president, 4 vice presidents, a secretary, and 9 other members. The council of state lays down universally binding interpretations of the laws and may issue decrees having the force of law when the Seym is not in session. It has treaty-making powers and the power to proclaim martial law or military mobilization. It also exercises ultimate control over the local people's councils.

People's councils are elected in towns, districts, and other minor subdivisions of the country, those in smaller subdivisions being subject to those in the larger subdivision of which they are parts. Each people's council acts through a presidium. Their function is to insure the maintenance of public order and watch over the observance of the people's rule of law. In other words, they form the mechanism by which the authority of the state makes itself felt.

There is a supreme court whose judges are appointed for 5-year terms by the council of state.

PORTUGAL

One of the great European monarchies of medieval and early modern times, Portugal has been a recognized state since the 12th century. Except for a period of Spanish rule from 1580 to 1640, Portugal was a kingdom until 1910. On October 5, 1910, the Independent Republic of Portugal was proclaimed.

Following a military revolt in 1936, Marshal Antonio Carmona became president, a position he held until 1951. In 1932 Antonio de Oliveira Salazar became premier. Until 1968, Salazar dominated political life in Portugal, reducing the presidency to a figurehead status. Under a constitution adopted in 1933, Portugal's government remained stable until 1974.

On April 25, 1974, a coup led by the Armed Forces Movement seized power, ending more than 40 years of civil dictatorship. A transitional government was then established.

Two years after the armed forces coup, the first free parliamentary election in 50 years took place, on April 25, 1976. A 265-seat assembly was elected, the Socialist party capturing 107 seats. A new constitution committed the government to socialist policies. General Antonio Ramalho Eanes was elected president on June 27, 1976, and he appointed Mario Soares premier. Under the new constitution, the president held the power to name a premier and his cabinet, to veto legislation, and to dissolve the assembly.

The once-vast Portuguese colonial empire has all but disappeared. In 1974, Guinea-Bissau (formerly Portuguese Guinea) was granted independence; in 1975, Angola, the Cape Verde Islands, Mozambique, and Sao Tomé and Principe became independent. Portugal planned to grant independence to Macao and other lesser territories by 1978.

QATAR

Under British protection until 1971, Qatar is a sheikdom in the Persian Gulf region, bounded by Saudi Arabia and the United Arab Emirates. There is a minister of foreign affairs, but no legislature. The capital and chief port is Doha (population 120,000). The area of the peninsular country is some 4,250 square miles; the total population is estimated at 180,000. Qatar has a treaty of friendship with Great Britain.

RHODESIA

Government

Located in the southern part of Africa, Rhodesia was for many years the British dependency of Southern Rhodesia. In 1965 Rhodesia unilaterally declared itself independent, thus blocking England's intent to guarantee eventual black majority rule. The new government—controlled by the white minority, estimated at under 5 per cent of the over 6 million inhabitants—was led by Prime Minister Ian Smith. The legislative assembly consisted of 50 members elected by the white inhabitants and 15 members elected by the black population. Threatened by UN sanctions and international boycotts, Rhodesia's position has remained critical.

Negotiations continued through the 1970s between Rhodesian and British officials. In 1971 Ian Smith actually initialed an agreement for ultimate majority rule, but he later disavowed it. Black nationalists started to mount armed resistance; in December 1971, guerrilla war began along the Zambian and Mozambique borders to the north and east. The balance of power shifted in favor of the blacks in 1974 when the Portuguese revolution led to the independence of Mozambique and Angola. The two new Marxist governments became involved directly in the struggle and provided safe bases for nationalist guerrillas. Its supply routes to the ocean cut off by hostile black nations, the Rhodesian government began to depend heavily on the white-ruled Republic of South Africa for trade and arms.

Fearing a major war and Soviet interference, as in the Angolan civil war, U.S. Secretary of State Kissinger began "shuttle diplomacy" between Rhodesia and black leaders in September 1976. After 12 days of intense negotiations, an agreement seemed to have been accepted by both sides. The plan called for a compromise transitional government with black majority rule by 1978. The interim administration would consist of a 4-man council of state, composed of two whites and two blacks, with one of the whites serving as chairman. Under that council would be a council of ministers, which was to have a black majority and a black "first minister." The army and police would be controlled by the whites and the new constitution would be constructed inside Rhodesia by the interim government. Black leaders then reconsidered and rejected the plan, claiming it would legalize the existing racist structures of power. In late 1976, Ian Smith, the presidents of the 5 "front line" countries (Zambia, Tanzania, Mozambique, Botswana, and Angola), and black Rhodesian leaders met in Geneva, Switzerland, under the auspices of the British. Although March 1, 1978, was established as the target date for independence under majority rule, Smith continued to promote a plan for a multiracial government.

In Rhodesia the black nationalists were divided into at least 6 feuding factions. Who would gain power would depend on whether a peaceful transfer could be negotiated. All nationalists had agreed that the new country would be renamed Zimbabwe, after an ancient African civilization that once thrived in the area.

RUMANIA

Rumania is a people's republic, after having been a monarchy from the time of its liberation from Turkish rule in 1877 until 1947. Russia occupied Rumania in 1944. In the election of 1946, the Communist party won control of the government and drew up a draft constitution on Soviet lines. Most of the industries were immediately nationalized, and no move was made without Russian consent. A new constitution was adopted in 1952, which affirms the role of the Rumanian Workers' Party as the "leading political force."

The constitution declares that Rumania is a people's republic of working people of town and country. It sets forth a foreign policy of alliance with the Soviet Union. Power of the people is said to be exercised through the Grand National Assembly and the people's councils, the latter being called the political foundation of the republic. Social ownership of the means of production is decreed, either in the form of state property or in the form of co-operative-collective property. The land, it is stated, belongs to those who till it. Private property is recognized only in the form of a plot of land and household on a collective farm, a small shop where the owner alone works, or a sector of residual capitalism scheduled for eventual liquidation.

The legislative power resides in the Grand National Assembly elected for a 5-year term of universal suffrage, one deputy for each 40,000 inhabitants. The assembly has the power to amend the constitution. It establishes national economic plans. Its laws become effective when signed by the president and secretary of its guiding body, known as a presidium. There is no direct veto power. However, the presidium, accountable to the assembly, has very wide powers, which extend to interpreting the laws, annulling orders of the executive department on the ground of non-conformity with the law, appointing the military commander in chief, ratifying treaties, and ordering mobilization.

The assembly appoints also the highest executive organ of the state, namely, the council of ministers. This body is accountable to the assembly if in session; otherwise to the presidium. It adopts measures to carry out the economic plans and to maintain public order, directs the organization and raising of the military forces, and gives guidance in foreign relations.

RUSSIA

The vast territorial extent of Russia, amounting to one-seventh of the land surface of the globe, combines with the strength of the Russian people, more numerous than any other white nation, to make it one of the greatest political factors in the world. The Russian stock excels in physical vitality and in intellectual vigor, but was held for centuries in an oppressed state, illiterate and without freedom of opportunity.

Imperial Russia. For centuries, and even within the present century, the government was despotic. The emperor, or czar, bore the title of "autocrat of all the Russias." Legislation was by imperial decree, or *ukaz*. The imperial power was administered by a great bureaucracy, established by Peter the Great and divided into a hierarchy of classes, at the top of which ministers and political competitors contended for the favor of the court and for position and power. Corruption and inefficiency, at times moderated by a strong-willed ruler or by the abilities of a talented minister, permeated the organization.

Constitutional progress was contending with bureaucracy and reaction when World War I broke out in 1914. In a gesture of liberality, the czar in 1905 granted a constitution which set up an elective body, the Duma, but it was powerless to affect national policy. Meanwhile revolutionary pressure grew underground, led by embittered exiles waiting for an opportunity to overthrow the government.

The Revolution. The opportunity came during World War I, in which Russian defeats led to the rise of a liberal government set up by the Duma in 1917. The czar abdicated. But this government was overthrown shortly by a more radical party bearing the standard of dictatorship of the proletariat. It announced that Russia thereafter would be governed as a socialist state with the government owning the means of production. Under the ruthless leadership of Lenin, Russia thus established the first Com-

munist government. It was based on the gospel of Karl Marx, a German who lived in England to write his famous *Das Kapital.* This work purported to show that, under capitalism, the rulers appropriated the fruit of the labor of the ruled and that the latter could enjoy what they had produced only by overthrowing the system and substituting their own dictatorship. So began the world's most bloody revolution.

Looked at in the perspective of half a century, it would appear that Russia, an economically backward nation which had scarcely shared at all in the industrial and technological revolution, had taken this costly step to catch up quickly. Its economic success was striking. After World War II, it towered militarily over all other countries of the world except the United States. From the standpoint of government, it perfected the one-party system by which a constitution ostensibly providing democratic control could be operated by a party subject to autocratic control.

Constitution of 1920. A government, federal in form, was established with the definite purpose and hope of adding to the union as new states such countries as should establish "dictatorships of the proletariat." It was known as the Union of Soviet Socialist Republics (U.S.S.R.) and consisted at first of 5 separate republics. These were later increased to 16.

A Supreme Soviet (Council) of the U.S.S.R. was set up to legislate for the country, representatives being chosen by local "soviets." Class enemies were disfranchised, including those employing others for profit and all monks and priests. Moreover, the basis of representation gave five times as much weight to each city voter as to a rural voter. Control of the machinery of government was assured through party discipline, the decisions of greatest importance usually being made first in party councils and later ratified by elective assemblies, both in the U.S.S.R. and in the constituent republics. A uniform system of secret courts and of espionage served also to make control absolute in the hands of the ruler. This control was used to wipe out the remains of feudalism and capitalism and to replacing them by a system of production for use rather than for private profit. After a period of trial and error, the picture which emerged was somewhat as follows:

A supreme economic council determines what probably can be produced by industries of national importance, taking into account both raw materials, labor, and demand, as well as national welfare. The task of production is then allotted among plants, which are operated by corporations owned by the government. Wages and prices are fixed with a view to having consumption balance production. Profit and loss are absorbed by the government. A somewhat similar pattern is followed for industries of regional or local importance, the smaller political divisions operating them at their own risk and for their own profit. These industries are integrated with national plans through control of credit.

Constitution of 1936. Ostensibly on the assumption that the Russian people had become accustomed to the new system and would continue to operate it, a democratic constitution was announced in 1936, based on universal, secret suffrage.

Corresponding to a Congress there is a Supreme Soviet, consisting of two chambers—the Soviet of the Union and the Soviet of Nationalities. The Soviet of the Union is popularly elected, one deputy to each 300,000 of the population. The Soviet of Nationalities, like the United States Senate, is intended to give equal representation to separate states irrespective of their population. Each state, or "union republic," sends 25 deputies, each "autonomous republic" sends 11, each "autonomous province" sends 5, and each national area sends 1. The deputies to the Council of Nationalities are directly elected by the voters within these constituencies. Both chambers have equal legislative rights. In case of failure to reach agreement on a bill after reconciliation efforts of an interchamber committee and resubmission to the chambers, the Supreme Council must be dissolved and a new election must be held. The term of office is 4 years.

The two chambers in joint session elect a presidium of 33 members, including a president, 16 vice presidents, a secretary, and 15 members. This body is declared responsible to the Supreme Soviet, but it has very broad powers. It issues decrees, convenes the Supreme Soviet, interprets the laws, and may annul as invalid orders of the highest executive body, the council of ministers. The council of ministers is appointed also by the Supreme Soviet. It exercises the function, not only of administration, but the economic planning on which ultimately the strength and development of the country depend.

The supreme court justices are elected by the Supreme Council for 4-year terms. Other judges are elected by the people for 3-year terms.

Individual republics have similar forms of government. Federal law is paramount in all cases of conflict of authority.

Behind and parallel to the constitutional government is the organization of the Communist party, the real seat of power, whose supreme organ is the Soviet Union Party Congress. This body, made up of delegates from provincial congresses, elects the central executive committee, which in turn elects a secretariat of 5 members. One of these, the general secretary, is the real head of the party. This Secretariat controls legislation and foreign policy, though the formal action is taken by the state administration, all of whose organs are headed and controlled by party members. Party discipline is rigorously enforced.

Property Rights. These are of three kinds—public, co-operative, and private. Means of industrial production and most property necessary to public services are owned by the government, either federal, state, or local. These include the bulk of the dwelling houses in cities and industrial localities. Means of agricultural production and property used in providing certain services in common are owned by co-operatives. Individuals may own property provided it is not used to exploit the labor of others. Trading for profit is forbidden. Individual houses and lots, household equipment, and other personal property fall within the permissible limits of individual ownership.

Bill of Rights. Citizens are guaranteed the right of remunerative work, of reasonable leisure, of education, and of support and medical care when unable to work. Guaranteed also is freedom of conscience, of speech, of the press, of assembly, of street processions, and of organization. Unlawful search, seizure, and arrest are forbidden. Women are given equal status with men. On all alike rest the duties of performing social obligations, safeguarding public property, and serving in the armed forces of the republic. Asylum is provided for foreigners persecuted for defending workers' interests, for their scientific activity, or for their struggle for national liberation.

The constitution may be amended by a two-thirds vote of both chambers of the Supreme Soviet.

Foreign Relations. At the beginning of the Soviet regime, Russia practically declared war upon all governments adhering to the capitalistic system. As an instrument of propaganda, the "Third International" was established at Moscow in the spring of 1919. Propagandists were sent abroad through the countries of Europe, America, and Asia. After China established a Communist government in 1949 and subsequently challenged Russia's leadership in the Communist party, the effect of such propaganda weakened—partly because of the rivalry and partly because of the practical demonstration in other nations that the fruits of labor can be distributed broadly without autocratic control by government. Russia's growing economic well-being finally asserted its influence for preferring peace.

Government

RWANDA

Rwanda was established as an independent republic in 1962 from part of a former trusteed territory of Belgium. A legislative council formed in 1961 declared the government a republic following a referendum in which a majority voted to abolish the monarchy. It has a 47-member Assembly elected by universal suffrage for a 4-year term and a president similarly chosen for 4 years. The president names the vice president with the Assembly's consent.

SALVADOR, EL

El Salvador became an independent republic in 1839, when the Central American Federation was dissolved. A constitution first proclaimed in 1824 was repeatedly modified. In 1945 the constitution of 1886, repealed in 1939, was reinstated with some alterations. This constitution was replaced in 1950 by a new one which, in turn, was succeeded by the constitution of 1962. There is universal suffrage for election of a single-chamber legislature whose members are elected for 2-year terms, one member for each 38,000 inhabitants. The president is popularly elected for a 5-year term and may not succeed himself. He is assisted by a cabinet of 10 ministers.

SAN MARINO

Lying within Italy, San Marino is known as the world's smallest and oldest republic—founded about A.D. 350. Its neutrality violated by both sides in World War II, from 1945 to 1957 it was ruled by a Communist-Socialist coalition but is now anti-Communist. The legislature is a council of 60 members elected for 5-year terms by popular vote. The council elects 10 members to its administrative council of state. There is no prime minister, but two council members are appointed as regents every six months.

SAO TOME AND PRINCIPE

The Democratic Republic of Sao Tome and Principe gained independence from Portugal on July 12, 1975. The island group was discovered by Pedro Escobar and Joao Gomes in 1471. To colonize them, the Portuguese sent convicts and others expelled from Portugal. Slaves were brought from Angola to work on plantations—slavery existed until the 1950s. Sao Tome and Principe, with the islands of Pedros Tinhosas and Rolas, became an overseas province of Portugal in 1951; Portuguese citizenship was granted its inhabitants in 1961.

In 1972 the Movement for the Liberation of Sao Tome and Principe was formed under Manuel Pinto da Costa. After the 1974 military coup in Lisbon, Portugal began negotiations with the movement, agreeing in November to recognize the islands' independence on July 12, 1975. A provisional government, with Da Costa as president, was established, pending the adoption of a constitution. Portugal appointed a minister and a high commissioner to help the new government. The government consisted of a president, a prime minister, and a cabinet of 10 ministers. Sao Tome and Principe joined the UN in September 1975.

SAUDI ARABIA

This kingdom embracing almost the entire Arabian peninsula was formally established in 1926, when Ibn Saud, sultan of the Nejd, conquered Hejaz and joined these two mid-peninsular territories.

Government takes the form of a feudal autocracy although a constitution was issued in 1926 and subsequently amended. The religious law of Islam is the common law of the kingdom. It is administered by religious courts. The constitution provided also for setting up a consultative Legislative Assembly and municipal councils consisting of tribal officials and notables nominated or approved by the king. In 1958, a so-called cabinet system was instituted but the king retained the power to name the members.

SENEGAL

Senegal became an independent republic in 1960, having chosen in 1958 to sever its ties with France, its former ruler, but to remain within the French Community. It has a president and a National Assembly of 80 members elected by universal suffrage for 4-year terms. The president is assisted by ministers and secretaries of state, who are chosen by him and may not be members of the Assembly.

SEYCHELLES

A 90-island archipelago in the Indian Ocean, the Republic of Seychelles (SAY-SHELL') gained full independence in June 1976. It was originally settled by the French in 1794 before passing to the English in 1814 as a result of Napoleon's defeat. Seychelles was a British crown colony from 1903 until limited self-government was granted in 1970. The 1976 constitution provides for a president as head of state, a premier as head of the government, and a single-chamber national assembly of 42 members elected for 5-year terms. Seychelles became a full member of the British Commonwealth of Nations at independence and was admitted to the UN in September 1976.

SIERRA LEONE

After 174 years of British rule, Sierra Leone became an independent African democracy and a member of the British Commonwealth in 1961. In 1971, after a succession of military coups, a new constitution was adopted. The nation was declared a republic, with executive power assigned to the president as head of state and commander of the armed forces. Elected through the assembly, the president serves a 5-year term. He is assisted by a cabinet of ministers for domestic and foreign affairs. The judicial system consists of a supreme court and local courts following native tribal law. Internal government is based on the authority of "paramount chiefs" of tribes.

SINGAPORE

The world's fifth largest port, Singapore is the largest Chinese community outside the mainland; however, it has an anti-Communist republican government. A former British colony, it was given internal self-government in 1959. Singapore achieved full independence in 1965 and entered the British Commonwealth. A 1970 constitution provides for a one-chamber parliament of the members elected by popular vote of citizens over 21. Parliament is responsible for the election of the president, who is the chief of state. A prime minister assists the administration.

SOMALI REPUBLIC

A republic formed in 1960 through the union of territories formerly under the control of Britain and Italy. A constitution was adopted in 1960. In 1969 military forces took control of the government. The parliament was dismissed, the constitution suspended, and the supreme court dissolved (later reinstated). A supreme revolutionary council was formed to administer the country. The council appointed 14 civilian secretaries of state.

SOUTH AFRICA

The Republic of South Africa includes the provinces of Natal, the Cape of Good Hope, the Transvaal, and the Orange Free State. South Africa also controls the territory of South West Africa.

The head of the republic is the state president, elected to a 7-year term by the electoral college. The electoral college consists of the senate and the house of assembly and is presided over by either the chief justice or a judge of appeal designated by the chief justice. The state president selects the prime minister and other ministers to form a cabinet. He has the authority to summon, adjourn, and dissolve parliament.

Legislative power is vested in the parliament, composed of the state president, house of assembly, and senate. Members of the house of assembly serve for 5 years and are chosen from electoral divisions in the provinces and South West Africa (Namibia). A member of the house of assembly must be a white South African citizen, a resident of the republic for a minimum of 5 years, and qualified as a voter. The senate consists of members nominated by the state president-in-council and of members elected from the provinces and South West Africa. A senator must be a white South African citizen, at least 30 years of age, a resident of the republic for a minimum of 5 years, and qualified as a voter in one of the provinces. A senator's term of office is 5 years. Parliament must meet at least once a year.

In each province there is an administrator, appointed by the state president-in-council for 5 years, and a provincial council. The administrator is chairman of the provincial council. The council, which is elected by the same system as members of parliament, elects a 4-member executive committee. The provincial committee and council have the authority to handle local matters.

Pretoria is the seat of government; Cape Town is the seat of legislature.

SOUTHERN YEMEN

See *Yemen, Republic of (South)*.

SPAIN

The kingdom of Spain was formed in the latter part of the 15th century by the union of a number of monarchies and by conquest of the southern part of the peninsula from the Moors. Under Charles V and Philip II, the ancient rights of these kingdoms and certain representative institutions which they possessed were suppressed and the basis for absolute monarchy was laid.

The modern constitutional history of Spain begins in 1808; it was followed by a period of civil conflict between liberal and reactionary forces, within which period Spain for a brief time, 1873–74, was a republic. The Bourbon family, under Alfonso XII, was restored at the beginning of 1875. This dynasty ruled until April 14, 1931, when King Alfonso XIII was driven from the throne. Spain was proclaimed a republic, a constituent *Cortes* was elected on June 28, and a new constitution was adopted on December 9 of the same year.

Republican Constitution. The constitution of 1931 provided for a democratic republic, with separation of church and state. Legislative power was exercised by a single-chamber Cortes, its members elected by universal suffrage on the basis of proportional representation. The president was elected for a 6-year term.

Corporate State. In 1936, by a coalition of leftist parties, the Cortes removed the incumbent president and elected a successor. Rightist parties organized a rebellion under the leadership of Gen. Francisco Franco, who, after 3 years of civil war, established a Fascist-type dictatorship with himself as chief of state and head of the Falangist party. In 1947, Franco announced that Spain would become a monarchy with him as head of state and that, on his death, a king or regent should be nominated by a two-thirds vote of the regency council and approved by a two-thirds vote of the Cortes. Embodied in a law of succession, this proposal was ratified in a popular referendum by an overwhelming majority.

The constitution of 1942 provided for a 441-member Cortes. By a national referendum in 1966 various regulations of the constitution were consolidated and partly modified to form the "Organic Law of the Spanish State." This law explains the executive powers of the head of state (king) and those of the premier. The head of state directs the government through a council of ministers. In case of absence or illness of the head of state his functions are performed by the heir to the throne—if over 30 years of age—or by the regency council. The premier is to be chosen by the head of state from 3 recommendations submitted by the council of the realm. The premier's term of office is 5 years, although he can be removed by the head of state on proposal of the council of the realm.

The council of the realm consists of 16 members; the president of the council is its chairman. There also is a national council composed of 1 elected councillor for each province, 40 councillors appointed by the head of state, 12 elected by the Cortes, 6 appointed by the premier, and a secretary-general appointed by the head of state.

The Cortes consists of the members of government; the national councillors; the presidents of the supreme court of justice, the supreme military tribunal, the court of exchequer, the national economic council, and the council of the realm; 150 representatives of the trade unions; representatives of the municipalities and provincial councils; 100 deputies elected by the heads of families; and some 30 other representatives.

Roman Catholicism is established as the state religion. The church and the national government cooperate in matters of common interest.

In local government, municipalities manage their affairs through councils elected by heads of families. Each province has a sole administrator.

Juan Carlos I, grandson of Alfonso XIII, became king in 1975, succeeding Franco as head of state. Spain was faced with problems of political and economic unrest—strikes and violence occurred increasingly. Abroad, Spanish troops left the Sahara colonial territory under pressure from Arab states. In Spain, there were continued movements for amnesty for political prisoners. Unemployment remained high and wages low.

Promoting economic and political reform, Juan Carlos appointed a new premier, Adolfo Suarez Gonzalez, in July 1976. Suarez was to guide Spain in its transition to democracy.

A legislative election was held in June 1977—Spain's first free election in 41 years. Premier Suarez and his political party won wide approval. The premier announced a new constitution would be drafted.

Of Spain's once vast colonial empire, there remain only vestiges. The Canary and Balearic islands are treated administratively as a part of Spain. A protectorate over part of Morocco was relinquished to the kingdom of Morocco in 1956. The colonial empire, however, left the impress of Spanish institutions over wide areas, particularly in the Americas.

SRI LANKA (CEYLON)

Sri Lanka occupies the island of Ceylon in the Indian Ocean. It was invaded by the Portuguese in 1505, the Dutch replaced them by 1658, and the British took power in 1796. Ceylon became a crown colony in 1815 and a dominion in 1948. A 1956 agreement called for British withdrawal by 1962, but Ceylon remained in the Commonwealth of Nations. The 1972 constitution established the republic as an independent parliamentary democracy on the British model. The name Sri Lanka (great and beautiful island) was adopted at the same time. There is now a single-chamber national assembly with combined legislative and executive functions. Of its members, 151 are elected and 6 are appointed. The prime minister and his council of ministers are responsible to the assembly, whose members serve for 6 years. The president, appointed by the prime minister, serves for 4 years. Local administration in each of the 22 districts is by an agent of the central government. As a Commonwealth member, Sri Lanka observes an international affairs accord with Britain.

SUDAN

The Sudan obtained independence in 1956 from the British-Egyptian dominion previously controlling it. Sudan operated under a provisional republican constitution until 1958, when the army seized power. From 1964 to 1968 the provisional constitution was again in effect. Following the resignation of the president in 1969, a 10-man revolutionary council took over the government and military rule was reestablished. A constitution adopted in 1973 placed executive power in the president and his appointed cabinet. The president also may appoint one-tenth of the 250-member people's assembly. The three southern provinces are largely independent from the central government. This southern region is governed by a president who also is a national vice-president. It has a 60-member regional people's assembly.

SURINAM (DUTCH GUIANA)

In 1975, after more than 300 years as the Netherlands colony of Dutch Guiana, Surinam became an independent South American state. Holland had received the territory from Britain in 1667 in exchange for the island of Manhattan. At the time of independence, a new constitution was adopted for Surinam by its 39-member parliament. The 1975 charter provided for the new office of a president of the state. National problems persisted among the racially mixed population. Political power was a source of rivalry between the numerically close populations of Creoles (of African ancestry) and those of Asian Indian descent. Before independence, large numbers of the Asians, as Dutch colonial citizens, had sought jobs and welfare in Holland. After independence, the new Surinamese government sought the return of the emigrants.

SWAZILAND

The last British protectorate to gain independence (1968), Swaziland is a constitutional monarchy within the British Commonwealth. It is linked economically by a customs union with South Africa. In 1973 the king assumed supreme power, revoked the constitution, dissolved parliament, and banned all political activity. He appointed a royal constitutional commission to draw up a new constitution, but has not yet accepted its proposals.

Swaziland is divided into 4 districts governed by district commissioners.

SWEDEN

Sweden has long been the seat of constitutional system. The representative legislature *Riksdag* came into existence in the 16th century. Between 1680 and 1718, however, during the period of Sweden's prominence as a military power, the monarch became well-nigh absolute. This was followed by a period of legislative dominance.

In 1973 parliament approved a new constitution replacing the one adopted in 1809. It reduced the king to a mere figurehead, lowered the voting age to 18, and guaranteed citizens the right to hold demonstrations.

Since World War I, the general progress in democracy has affected the Swedish constitutional system. By a constitutional change, a foreign affairs committee of the Riksdag, with which the government consults on international affairs, is elected each year. The Riksdag is a one-chamber parliament of 349 members directly elected to 3-year terms by all men and women over 18. Election to the Riksdag is proportional. Three hundred and ten members are elected from 28 voting districts, while the remaining 39 members are elected from a nationwide pool.

The kingdom is divided into 24 administrative provinces or counties, in which the administration is confided to a governor in Stockholm. Each province has a legislative assembly whose members are elected directly by voters on the principle of proportional representation. Absentee voting is permitted; a husband may carry his wife's sealed ballot to the polls, and a wife, that of her husband. Soldiers, seamen, fishermen, and employees of railroads, ports, customs, and pilot services may vote by post. There is an optional referendum, or plebiscite, which may be ordered on important matters if the government and the Riksdag concur in believing it advisable.

The supreme court of Sweden has a constitutional status, while courts of appeal and district courts of first instance are organized by laws. The supreme court is authorized to render an interpretation of the law, if requested by the government.

SWITZERLAND

The "Swiss Confederacy" is the oldest republic of Europe and the first European state to adopt a federal form of government adapted from the American plan. This country is also the originator of several widely adopted democratic institutions and is an example of how peoples of different race (French, German, and Italian), of different speech, and of different religious belief may form a completely harmonized nation.

The country is composed of states or "cantons." Alliances and unions between certain of these small states date from the 13th century; but it was not until 1848 that the existing union, under a true federal form of government, was achieved. This constitution was revised in 1874 and was added to by several later amendments. The central government is complete and adequate, and certain of its powers are exercised directly upon the people and upon the territory of the whole country. The cantons, however, are protected in free exercise of their local jurisdictions by the constitution. Sovereignty undoubtedly resides in the whole nation; the union is thus a federation and not a confederacy, as its official title might imply.

The national legislative power is conferred on the Federal Assembly, which consists of two chambers. The upper house, like the American Senate, represents the separate states and is called the Council of States. It is composed of 44 members, 2 from each canton. The mode of their election, their term of service, and their remuneration are left to the cantons. The more popular house, or National Council, consists of about 200 deputies chosen by direct vote, one for each 22,000 of the population. Members of the National Council are paid from the federal treasury. Their term is 4 years. All Swiss citizens over 20 years of age are entitled to vote.

Referendum and Initiative. Switzerland has made fuller experiment of direct or popular legislation than has any other country. There is a national "referendum" of federal legislation, which is (a) obligatory for all amendments to the constitution and (b) optional upon petition of 30,000 voters or upon the demand of 8 cantons on more important acts of legislation. Perhaps the most striking instance of the exercise of this right was the proposal to enter the League of Nations, which was submitted to the voters in May 1920 and approved by a popular vote of 414,000 to 322,000. Switzerland did not apply for membership in the United Nations. An initiative procedure for amendments of the constitution on petition of 50,000 voters was adopted in 1891.

Commission Executive. Strong democratic prejudices prevented the makers of the Swiss constitution from entrusting the executive power to a single person like the American president. In place of a presidency or a ministry, there exists a commission of 7 members, who are chosen by the Federal Assembly for a 3-year term and are usually re-elected if competent. This commission is called the Federal Council. It is responsible to the Assembly for its conduct of affairs, and its dispositions may be overruled. Besides administering, it prepares legislative acts to be submitted to the Assembly. Each member is charged with the administration of a separate department—political (foreign affairs), interior, justice and police, military, finance and customs, national economy, and posts and railways. However, responsibility is collegiate, and matters of importance are considered "in commission."

Each year the Federal Assembly designates one member of the federal council to serve as "Swiss president." He becomes thereby the representative of the state at home and abroad and oversees the conduct of the business of the executive commission. He is ineligible for re-election for a consecutive term. A vice president is elected at the same time as the president and, by custom, succeeds to the chief office. While this institution of "commission executive" might be inapplicable to republics differently situated, its practice has commended itself to the Swiss nation.

There is a federal court. The judges and their alternates are appointed for a 6-year term by the Assembly. This court decides cases of conflict of jurisdiction between federal and cantonal authorities, cases between cantons, and private complaints based on violation of constitutional or treaty rights. It also has jurisdiction in certain cases between the federation and individuals.

Cantonal Government. The 22 cantons differ interestingly in the form in which their democratic character is politically exhibited. Five are small mountain states and are genuine democracies. There is no representative legislature, but laws are enacted by a popular assembly, even meeting by custom in the open field.

The other cantons have local unicameral legislatures usually called the grand council or the cantonal council. All but one of these cantons (Freiburg) has either the obligatory or optional referendum. In all cantons the executive power is entrusted to a commission of 5 or 7 members known as the administrative council or the small council. At the head of each commission is a president and a vice president

The larger cantons are divided into administrative districts or are organized in communes. Each canton has its own judicial system, comprising justices of the peace, district courts, and a superior court. There may be also special courts of commerce and industrial courts, on which sit representatives of employers and workmen. Within the jurisdiction of the cantons are such matters as poor relief, public health, labor protection, agricultural improvement, primary schools, maintenance of religious worship, citizenship, and naturalization. Proportional representation is established in several of the larger cantons.

Switzerland is a country of guaranteed neutrality by action of the "great powers" in 1815, and neutrality as well as independence is enjoined by the Swiss constitution. This status does not limit the republic in taking measures to safeguard its security, and the Swiss, always a people of high military spirit, are completely organized in a citizen army.

Switzerland has for centuries extended asylum to political and religious exiles, and is the home of a number of international associations, including the Red Cross Society and the Postal Union. The League of Nations had its seat in Geneva.

SYRIA

The Syrian republic was formerly a province of the Turkish Empire, and from 1920 until its independence in 1943, was a French mandate under the League of Nations. While under the mandate, Syria set up a republican form of government with a one-house legislature. In 1958 Syria and Egypt joined to form the United Arab Republic as a hoped-for nucleus of a federation of all Arab states. Three years later, the government was overthrown and the union with Egypt was dissolved. In 1964 a provisional constitution was adopted. Although the constitution was republican in form, the government was not a representative government but was operated by a few individuals.

A permanent constitution was approved by plebiscite in 1973. The president is chief of state and head of the government. Elected for a 7-year term, he has the power to dissolve the legislature and to appoint and dismiss the vice-president. The constitution made permanent the people's council whose 173 members are nominated by presidential decree. The constitution protects personal and religious freedoms and declares the economy socialist.

TANZANIA

Tanzania is a federation formed in 1964 from Tanganyika and Zanzibar, each part having a republican form of government. Tanganyika emerged from colonial status under Britain in 1961 and in 1962 became a republic within the British Commonwealth. Zanzibar became independent of Britain in 1963 under a monarchy, which was overthrown in 1964 to become a people's republic. The president is head of state and commander-in-chief of the armed forces. The first vice-president of Tanzania is the president of Zanzibar; the second vice-president and prime minister is the head of the national assembly. The national assembly is composed of 193 members: 96 elected from Tanganyika, 10 appointed from both Tanganyika and Zanzibar, 15 elected by the national assembly, 20 regional commissioners, 32 members from the Zanzibar revolutionary council, and 20 members from Zanzibar appointed by the president.

THAILAND

Thailand, formerly Siam, was an unlimited autocracy until 1932, when a revolutionary group seized the government. The king then ruled as a constitutional monarch. In 1939 the name of the country was changed to Thailand. The 1932 constitution was replaced by a new constitution in 1946 which lasted a little over a year. A military revolution in 1947 led to extensive revisions in 1949. The army again took control in 1951 and restored the constitution of 1932, which was in effect until 1958.

In 1959 an interim constitution was established by decree. Its principal feature was the formation of a constituent assembly appointed by the king to draft a permanent constitution, the governing of the country meanwhile being carried on by a council of ministers appointed by the king.

In 1969 the first general elections in 11 years were held under a new constitution. The government formed consisted of a prime minister, cabinet, and house of representatives. The constitution was suspended in 1971 when a military group took control. The military government was forced to resign in 1973 and a national convention enacted a new constitution in 1974. In 1975 a house of representatives was elected and a senate was appointed by the interim premier. The coalition government formed consisted of a prime minister and cabinet. New elections in 1976 moved the government to a more leftist situation. Later that year, a military junta again seized control.

TOGO

Togo became an independent republic in 1960. It was a German colony from 1894 until World War I, after which it was a trusteed territory. The UN relinquished its trusteeship after the citizens of Togo had voted, in 1956, to join the French Community as an autonomous republic. When its president was murdered in 1963, a new president was appointed and a strongly centralized government was established with a national assembly elected every 5 years. In 1967, asserting that civil war was at hand, the army chief Etienne Eyadema led a bloodless coup. Although he promised elections shortly, four mouths later Eyadema named himself president and defense minister of a largely military state. The government was reorganized in 1975. Togo was one of the prime forces behind the 1975 economic union of 15 countries—The Economic Community of West African States. Along with Nigeria, it has major responsibility to steer the organization.

TONGA

Tonga became an independent constitutional monarchy on June 4, 1970. It was a British protectorate from 1900–1970, thereafter remaining a member of the Commonwealth. The Sovereign, a Privy Council, and a Cabinet headed by the Prime Minister constitute the executive authority of Tonga, and the partly elected Legislative Assembly is the legislative branch of government.

TRINIDAD AND TOBAGO

This constitutional parliamentary democracy was granted independence from Great Britain in 1962, remaining a member of the British Commonwealth. Its constitution provides for a House of Representatives of 36 elected members and a Senate of 24 appointed members—13 appointed on the advice of the premier, 4 on the advice of the leader of the opposition in the House of Representatives, and 7 from religious, economic, and social bodies considered important by the premier. The appointments are made by the governor-general.

TUNISIA

Tunisia, a former French protectorate, declared itself a republic in 1957. Under a constitution adopted in 1959, the president, who must be a third-generation Tunisian of Islamic faith, is elected by universal suffrage for a five-year term. A National Assembly of 90 members is similarly elected at the same time, under a one-party system. The president may introduce into the Assembly bills which have precedence over other bills. He must promulgate within 15 days measures passed by the Assembly but may send them back for reconsideration, in which case they require a two-thirds majority. He names the ministers who assist him in governing. He may succeed himself three times.

TURKEY

The republic of Turkey was established in 1924. The country is what remained of the former Turkish Empire with capital at Istanbul, then known as Constantinople. After World War I the sultan was deposed by a nationalist leader Kemal Pasha, and a constitution was adopted in 1921 which vested both legislative and executive power in a Grand National Assembly. Three years later the country was declared a republic. In 1960, the army under a national union committee overthrew the government and submitted to a referendum a new constitution, which was adopted July 9, 1961.

The sovereign power is vested in the Grand National Assembly, which is composed of a National Assembly and a Senate. The National Assembly consists of 450 members elected for 4-year terms by all citizens, women as well as men, over 23 years of age. The Assembly may decide to hold new elections before the end of the 4-year term. The Senate is composed of 185 members elected by universal suffrage, 15 members appointed by the president of the republic, and 15 *ex officio* members, including past presidents and the members of the national unity committee. Except for *ex officio* members the term of office is 6 years, one-third being elected every second year.

The president is elected for a 7-year term by the Grand National Assembly from among its members sitting in joint session. A two-thirds majority is required to elect on the first two ballots, thereafter a simple majority is sufficient.

The president appoints from members of the Grand National Assembly a prime minister, who recommends other ministers to be appointed by the president from that body or from those eligible to be elected to it. The ministers present the governmental program to each chamber and may ask for a vote of confidence in the Assembly. If a ministry is unseated within 18 months by a vote of lack of confidence and thereafter incurs a third such vote, the prime minister may ask the president to dissolve the assembly and call for a new election, the ministers meanwhile being replaced by new, provisional appointees.

UGANDA

This republic became independent of British rule in 1962 and was admitted to the British Commonwealth. The constitution originally provided for a governor-general, but in 1963 it was amended to substitute a president as the chief executive, thereby making the country a republic. A coup in 1966 resulted in a new government and constitution. When that government was overthrown by army troops led by Idi Amin in 1971, a military government was established. Amin dissolved the parliament and assumed all legislative powers, assisted by a council of ministers whom he appointed. Political parties were banned and political activities outlawed. Noncitizen Asians were expelled. Amin began a program of purges, took over privately owned land, nationalized the copper mines, and introduced the death penalty for economic crimes. Most professional workers left the country or were expelled. To relieve the crisis, Amin instituted two policies in 1975: a compulsory labor program and a settlement plan that moved urban unemployed to farmland. In 1976 Amin was named president for life.

Uganda's judicial system consists of a high court, presided over by a chief justice, and lower courts. In 1973 military courts were authorized to try cases of violent or subversive crimes.

Britain severed ties with Uganda in 1976—the first time a relationship with a member of the Commonwealth was ended.

UNION OF SOVIET SOCIALIST REPUBLICS

See *Russia*.

UNITED ARAB EMIRATES

Formed in 1968, this union consists of seven sheikhdoms, or emirates. Formerly called the Trucial States, or Trucial Oman, with Bahrain and Qatar, they made up the Persian Gulf States. Britain administered their defense and foreign relations from the 19th century until 1971, when British forces withdrew. Each state has a feudal government, under a hereditary emir. The states are: Abu Dhabi, Ajman, Dubai, Fujairah, Ras al-Kaimah (which joined in 1972), Sharjah, and Umm al-Qaiwain. Shiekh Zaid, of Abu Dhabi, became president in 1971. With rising oil reserves, he made the union a power in the Arab world.

UNITED KINGDOM See *Great Britain.*

UPPER VOLTA

Upper Volta became an independent republic in 1960, remaining within the French Community. In 1966 Sangoule Lamizana overthrew the existing government, dissolved the national assembly, and suspended the constitution. He imposed military rule until 1970, when a new constitution was adopted. In 1974 the army resumed power; the constitution was again suspended and political activities were banned. Lamizana replaced the national assembly with a national council having only advisory function. Although the 65-member council had to include 12 soldiers or veterans, 11 rural representatives, and 8 trade union members, all were appointed by the president. Because of increasing conflict between unions and the military government, Lamizana announced a new largely civilian council in 1976, and promised a new constitution.

Upper Volta's judicial system includes a supreme court with constitutional, judicial, administrative, and fiscal chambers; a high court of justice; a court of appeals; and 4 lower courts. Since 1967 a special tribunal under the minister of justice hears cases involving national security.

URUGUAY

The Republic of Uruguay became independent of Spanish and Portuguese claims in 1828. Its first constitution, 1830, provided a centralized form of republican government. In 1919 a new constitution, designed to avoid dictatorship, divided executive power between a president and an administrative council, both elected by the people but for different terms. A constitution adopted in 1951 abolished the presidency entirely, and all executive power was vested in a 9-member bipartisan national council. Uruguay returned to the presidential system in 1966. Dissolving congress in 1973, the president ruled by decree until June 1976, when he was overthrown by the army. Uruguay was then ruled by a national council consisting chiefly of military men. In July 1976 the council named a president with limited powers for a 3-year term.

VATICAN CITY

Vatican City became an independent sovereign state in 1929 when the Holy See and Italy signed the Lateran Pacts. The smallest state in the world, it is an elected absolute monarchy. Its constitution, adopted in 1929, names the pope, who is head of the church, as head of state. The pope, elected on the death of his predecessor by a two-thirds majority of the College of Cardinals, has full legislative, executive, and judicial powers. He appoints and can remove all members of the various committees or Congregations to which he delegates authority. There is no legislature and there are no elections. During a vacancy in the papacy, the College of Cardinals assumes authority.

Vatican City has its own flag, seal, stamps, and money. Citizenship is granted to permanent residents and is lost when that residency is ended. Vatican City is pledged to political neutrality between governments. It is not a member of the United Nations, although it maintains official observers there.

VENEZUELA

In 1829 Venezuela seceded from the republic of Colombia and formed a separate republic to include the territory of the former "captaincy-general" of Venezuela. Its first constitution was proclaimed in 1830.

Under the constitution adopted in 1961, executive authority is vested in a president chosen by direct popular vote for a 5-year term. He may not serve an additional term until 10 years after his first term.

The legislative authority is vested in a congress composed of a senate and a chamber of deputies. Two senators are popularly elected from each of the 20 states and the federal district for 5-year terms, and ex-presidents also serve as senators. Deputies are popularly elected from districts none of which may have more than one per cent of the population. The term is 5 years. Suffrage is universal and compulsory for all citizens over 18.

Bills may be introduced into either house by legislative committees, by any three or more legislators, by the president, and by 20,000 or more voters. If a bill passed by one house is amended by the other, the differences are resolved in joint session. If the president disapproves of a bill, it may be passed over his veto by a two-thirds vote in joint session. If his objection is on constitutional grounds, the bill is submitted to the supreme court, whose decision must be made within 10 days. Members of the supreme court are chosen by congress for 9-year terms, one-third being renewed each 3 years.

Venezuela is composed of 20 states, 2 territories, and a federal district. They are autonomous, politically equal, and exercise residual powers not assigned to the federal government.

VIETNAM

Vietnam is part of former French Indochina. The French were defeated by troops under Communist leadership in 1954, when an agreement was reached at Geneva dividing control of the country. The north was under Communist control; the south was controlled by an anti-Communist party. The agreement called for a general election in 1956 in all Vietnam to determine its governmental status. The election was not held and guerrilla warfare broke out. When the French left, the U.S. lent support to the government of South Vietnam.

In North Vietnam, a Chinese-type Communist government was set up in 1960 calling itself a people's democracy. Ho Chi Minh was the first head of state, continuing until his death in 1969.

In South Vietnam, a republican constitution was adopted in 1956 with a president and a national assembly, both popularly elected. In 1961 the president was granted emergency powers to combat Communist encroachment. Two years later he was overthrown by a military group and the constitution was in abeyance as civil disorder and war with the north continued. U.S. aid was stepped up, as the war continued, to a peak in 1969 of 543,000 troops. In 1973 a ceasefire agreement was signed in Paris and U.S. troops were withdrawn. On April 30, 1975, South Vietnam was defeated by North Vietnam; a year later on April 25, 1976, the first national elections since 1946 were held. The Socialist Republic of Vietnam was officially declared reunited on July 2, 1976, after 22 years of separation.

A 492-member national assembly was elected by universal vote of citizens 18 and over. The 1976 election results showed 249 deputies from the north and 243 from the south. All candidates were selected by the Communist party. The assembly chooses a president, a premier, and 30 cabinet members. Real power lies with a 10-member politburo chosen from the Communist party. Vietnam is a member of the UN.

WESTERN SAMOA

This South Pacific island group became independent in 1962, after having been controlled by Germany, the United States, and New Zealand, which

still handles Western Samoa's foreign affairs. There is a unicameral legislature of 45 members, most of whom are chiefs of family or tribal groups. The head of state is a chief; the first was elected in 1962 to serve for life—his successors will be elected by the legislature for 5-year terms.

YEMEN ARAB REPUBLIC

Yemen Arab Republic fell under the rule of the Turkish Empire in the 16th century. The withdrawal of Turkish forces in 1918 allowed Iman Yahya to gain control. In 1958 Yemen joined the United Arab Republic as one of the United Arab States. In 1962 it became an Independent Islamic Arab republic.

A constitution adopted in 1970 established a government headed by a presidential council whose chairman served as the head of state. The council, a policy-making organ, appointed a prime minister, who selected a cabinet. The constitution also provided for a consultative council responsible for legislative functions. After a military coup in 1974, a command council suspended the constitution and the consultative council. The prime minister and his cabinet continued in office. Since then the consultative council has been reestablished, but the constitution remained suspended.

The Yemen Arab Republic is divided into 7 provinces, each headed by a governor or commander of armed forces. The provinces are subdivided into districts. Provincial and district officials are responsible to the central government. The judicial system is based on Islamic religious law. The Yemen Arab Republic is a member of the Arab League and the UN.

YEMEN, REPUBLIC OF (SOUTH)

British control of Southern Yemen began in 1839. Control of the territory was handed over by the British to the National Liberation Front on November 30, 1967. Its name was changed to the People's Democratic Republic of Yemen in December 1970.

Under the 1970 constitution executive authority is vested in a 3-member presidential council. The chairman of the council serves as chief of state. The prime minister, also a member of the presidential council, serves as the head of government and is responsible to the legislature. The legislative branch is the 101-member people's supreme council. The council is appointed by the supreme general command to represent the party, professional groups, and trade unions. Yemen is divided into 6 governates, each headed by a centrally appointed official. The governmental structure also includes a 7-member political bureau and a 31-member central committee. The judicial system is composed of a supreme court, a court of appeal, and magistrate's courts. In some areas, Islamic law and tribal customs are applied. The Republic of Yemen is a member of the Arab League and the UN.

YUGOSLAVIA

Yugoslavia was proclaimed a republic in November 1945; its first constitution was adopted in 1946. The 1963 constitution changed the name of the country to the socialist Federal Republic of Yugoslavia—composed of the socialist republics of Bosnia and Herzegovina, Crna Gora (Montenegro), Croatia, Macedonia, Serbia, and Slovenia. Every citizen over the age of 18 was given the right to vote.

A new constitution was issued in 1974. It strengthened the power of the central government and of the Communist party. It provided for greater political and economic control by workers through factory councils. The constitution stated that national and regional legislatures would be composed of workers and other nonprofessional politicians elected from factories and other economic units. The Communist party would provide guidance to the legislators. President Josip Broz-Tito would remain president for life and would be replaced by a collective presidency of 9 rotating members. Tito, president since 1953, is president of the Communist League of Yugoslavia.

ZAIRE

A Belgian colony from 1885, Zaire (formerly the Congo) was granted independence in 1960 under a parliamentary constitution. Within a week of independence the army mutinied; political infighting and rebellion swept the country. In November 1965, Lt. General Joseph Mobutu, commander of the national army, seized control of the government and declared himself president. For two years rebellions continued, but since late 1967 Zaire has had political stability and internal peace. In 1967 Mobutu founded the Popular Movement of the Revolution, a political party that has since become the sole political arm of the government. The same year Mobutu proposed a constitution which was approved by popular vote.

The name of the Congo was changed to the Republic of Zaire (ZY-EAR) in October 1971. In 1966 the name of the capital had been changed to Kinshasa from Leopoldville. The people were required to replace their Christian or foreign names with African ones.

New constitutional changes were made in August 1974 that resulted in a strong centralized presidential government. The president of the Popular Movement is automatically president of Zaire and presides over the political bureau, the party congress (which meets every 5 years), and the executive, judicial, and legislative councils. The president makes all major appointments, commands the armed forces, and can declare war and conclude treaties. Except for Mobutu, whose term is for life, presidents are to be elected for 5-year terms, renewable only once. Under the president is the 20-member political bureau whose decisions immediately become law. The legislative council, with some 200 members, drafts laws as directed by the president. Council members are to be chosen by the electorate from a slate. Voting is compulsory for all over 18.

ZAMBIA

The Republic of Zambia was formed in 1964 from the former British protectorate of Northern Rhodesia after the latter had acquired independence from the Federation of Rhodesia and Nyasaland. This federation, formed in 1953, was dissolved in 1963; it also had included Malawi (formerly Nyasaland) and Southern Rhodesia. Zambia remained a member of the British Commonwealth.

The legislative assembly has 10 nominated members and 125 members elected by universal vote for a 5-year term. The first president was appointed by the legislative assembly but his successors are elected by the people for a 5-year term. The vice-president is appointed by the president. The 1972 constitution provided for one-party rule.

POLITICAL TERMS AND INSTITUTIONS

THE study of the governments of the world today is facilitated by the scientific definition of political ideas and by increasingly accurate descriptions of forms of political organization. An acquaintance with these general conceptions and facts is necessary to comprehension of any nation's history and government. This dictionary presents, with brief and authoritative treatment, a large number of the most important of such institutions and terms. They are discussed in respect to their general forms and meanings and also with regard to particular developments and usages in different countries. Significant features of American political life are given especial attention.

This section therefore has a threefold value. It supplies a convenient reference dictionary of political terms. Further, it supplements the articles upon the history and the governments of the world, adding more complete treatment of special topics than could be given in those articles. Finally, it furnishes a valuable means for comparative study of political ideas and practices prevailing in different countries.

Absolutism. A form of government in which the supreme power of the state is vested in a person who rules unlimited by constitutional laws.

Admiralty (*ăd'mĭ-răl-tĭ*). The branch of the law which treats of civil and criminal cases arising on the high seas. In the United States, admiralty jurisdiction is vested by the Constitution in Federal courts.

In England, admiralty denotes that department of the government which has jurisdiction over the naval forces and over all merchant vessels flying the British flag.

Air Zone. Air space above the territory and waters of belligerents. In international law, air zone is regarded as a field for military combat.

Alderman. A member of a municipal body, either popularly elected or "co-opted," that is, added by choice of the municipal council.

Allegiance. Obligation of obedience and loyalty on the part of a citizen toward his country. An alien is under obligation of temporary and partial allegiance to a country in which he is a resident, and thereby is bound to obey its laws and answer the summons of its duly constituted authorities. The term is also used broadly to designate the relation of loyalty and support which one has assumed toward any institution, party, movement, or leader.

Ambassador. See *Diplomatic Representation.*

American's Creed. See *Creed, The American's.*

Amnesty (*ăm'nĕs-tĭ*). An act of government granting exemption from criminal prosecution and punishment. It often extends to a class or group. It differs from pardon in being granted before rather than after conviction.

Anarchism. A social doctrine which advocates the abolition of all governmental authority, to the end that the individual may be free to realize his desires and aspirations without legal restraint.

Apportionment. See *Representation.*

Appropriation. Restriction to a specific purpose of money voted by a legislative body. In England traces can be found as early as the Fourteenth century, but it did not become the established practice until the Seventeenth. In the United States it is prescribed by the Constitution (Art. I, sec. 9). Historically it has been an important means of controlling the executive.

Arbitration. A method of settling disputes between nations by referring the matters in question to an arbitral authority for decision. Sometimes this authority is an individual, as the head of a state; at other times it is a board, a court, or a special arbitral tribunal. International practice of arbitration has been much advocated in America.

Among important arbitrations to which the United States has been a party are the Geneva Award, 1872, which settled American claims upon Great Britain; the Venezuela Boundary Dispute of 1897; and the Bering Sea Arbitration of 1893. The United States has treaties providing for arbitration with many states. See *Hague Tribunal.*

Arbitration of Industrial Disputes. Continued struggle between employers and employees in the development of modern industry has occasioned repeated resort to arbitration to settle labor disputes and to terminate deadlocks, injurious not only to those concerned but to the public as well. Many states have established public boards of industrial arbitration without providing for compulsory resort to them.

In New Zealand, and later in New South Wales and in West Australia, laws have been passed compelling submission of industrial disputes to arbitration and providing state arbitral machinery.

In the state of Kansas, a compulsory arbitration act was passed in 1920, and a court of arbitration was created. This legislation was upheld by the state courts; but, in June 1923, the United States supreme court decided that the power accorded this court to fix wages is in conflict with the 14th amendment and is therefore unconstitutional.

Aristocracy. A term used by the Greek philosopher, Aristotle, to denote government by the best qualified. He recognized the tendency of such a form to degenerate into government by the corrupt or the wealthy, to which debased type he applied the name "oligarchy." Aristotle contrasted aristocracy with "monarchy" on the one hand and with "democracy" on the other, and since his time these have remained fundamental political conceptions.

The term "aristocracy" is applied also to the nobility and gentry of states with monarchical institutions, and so, by analogy, to those people who assume superior qualities or social standing.

Army of the United States. See *National Defense.*

Attainder. The extinction, by an act of a legislative body, of all civil rights of a person, and his sentence to death, without hearing or other judicial process. The Parliament of England passed many such acts, particularly during the 15th and 16th centuries. Bills of attainder are expressly prohibited by the Constitution of the United States and by most of the state constitutions.

Bills of "pains and penalties" of the British Parliament resembled bills of attainder, but they imposed lesser punishment than death.

Autocracy. A form of government in which political power is absolute and unlimited. This form of monarchy reached its greatest pretensions in Europe in the 18th century. It generally disappeared in the 19th century. Among the great European powers, Russia was the last to adhere to it, and the title of "Autocrat of all the Russias" was held by the czar until the abdication of 1917.

Ballot. See *Voting.*

Belligerency (*bĕ-lĭj'ĕr-ĕn-sĭ*). The status whereby regularly organized fighting forces become entitled to the protection of the laws and usages of war. The Hague Convention of 1899, which codified international rules of warfare, provided that troops, to be entitled to these privileges, must be part of the military organization of a recognized "belligerent"; must be commanded by properly commissioned officers; must wear distinctive uniform; must carry arms openly and not be guilty themselves of conduct contrary to the usages of war among civilized nations. Among recognized rights of belligerents are: the right of surrender and of capture rather than death upon the field; trial by court-martial before execution, and humane treatment as prisoners of war.

Belligerency is an official recognition withheld from mere rebels or insurgents, who may be treated without regard to the laws and usages of nations.

Bicameral (*bī-kăm'ĕr-ăl*) **System.** That form of legislature which consists of two separate chambers or houses, the concurrence of both ordinarily being essential to the enactment of legislation. A one-chamber legislature is known as a *unicameral* system. The bicameral system is found in the United States in both Federal and all state governments, with the exception of Nebraska. More than half the national legislatures in Europe are bicameral, the remainder being unicameral. In state, provincial, and local government, single chambers are the rule in Mexico and Canada.

The bicameral system is traced to the influence of the English bicameral Parliament, which, for reasons that were accidental rather than deliberate, early organized into a House of Lords and a House of Commons.

In the American state, the bicameral Congress harmonized the conflicting purposes of the framers of the Constitution, the Senate representing the states, with equal representation, and the House of Representatives, the nation, on the basis of population.

Elsewhere than in federal government, the two-chamber legislature is usually justified merely as a check upon hasty, ill-considered legislation.

Bill of Rights. An English act of Parliament of 1689, entitled "an act declaring the rights and liberties of the subject, and settling the succession to the crown." After reciting the abdication of James II and the vacancy of the crown, the act declares the ancient rights and liberties of Englishmen: (1) that it is illegal for the king to attempt to suspend laws without the consent of Parliament; (2) that levies of taxes without grant of Parliament are illegal;

(3) that subjects have the right freely to petition the king; (4) that the raising or keeping of a standing army within the kingdom in time of peace, unless it be with the consent of Parliament, is against the law; (5) that Protestant subjects may bear arms suitable for their defense and as allowed by law; (6) that the elections of members of Parliament shall be free; (7) that freedom of speech and debate or of proceedings in Parliament shall not be impeached or questioned outside of Parliament; (8) that excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted; (9) that a person accused of crime shall be entitled to a trial by impartial jurors; (10) that grants of the fines and forfeitures of accused persons before conviction are illegal; and (11) that Parliament shall be frequently convened.

These so-called "rights of Englishmen" expressed in definite form those limitations upon the royal prerogative to which Englishmen believed they were entitled under the customs and common law of the realm. Next to Magna Charta, the Bill of Rights of 1689 is regarded as the most important constitutional document in English history. The accession of William and Mary was made dependent upon its recognition. From this fundamental statement, similar bills have been framed in the course of constitutional development in many countries.

The American colonists held to the principle of these limitations upon the power of the crown, and their revolution rested in part upon the alleged violation of them. The first ten amendments of the Federal Constitution constitute the so-called "American bill of rights," several repeating the language of the English law. (See *Constitution of the United States.*) Similar constitutional guarantees have been incorporated in the constitutions of every American state.

In 1789, the French National Assembly adopted the famous "Declaration of the Rights of Man and of the Citizen" which, more theoretical than its English predecessor, has enjoyed scarcely less influence in the progress of revolution against autocratic government.

Bloc. A French word, meaning "mass" or "group," somewhat recently introduced into political parlance, to mean an association of legislative members or of political workers of different parties, formed to support a certain measure or ministry.

One of the most famous of such combinations was the so-called "Blue-Black bloc," a union of Conservatives (blues) and Clericals (blacks) in the German Reichstag, especially between 1894 and 1907, in which latter year a new bloc was created, that of the Conservatives and the Liberals.

The term has been introduced into American politics through the union of members of Congress pursuing certain agrarian policies in what is called the "agricultural bloc."

Blockade. The closing or blocking of entrance to the ports of a belligerent country by hostile naval forces to shut out neutral commerce and to prevent the entrance of supplies or re-enforcements. A blockade, to be valid in international law, must be officially declared by a belligerent against the ports of another belligerent; must be officially called to the attention of neutral powers; and must be effective.

During World War I, the British, by their naval control, practiced a blockade upon German ports by proclamation rather than by the close patrol of war vessels. This system was extended to ships bound for the ports of neutral countries contiguous to the central European powers, or with which they were able to maintain communication.

Bolshevism (*bŏl'shĕ-vĭz'm*). A term derived from the Russian *bolshestvo*, meaning "majority"; hence bolshevik, plural, bolsheviki. Bolshevism is the radical extreme of Marxian socialism. It accepts the doctrine of Karl Marx, that an irreconcilable antagonism exists between the propertied class, or bourgeois, and the propertyless workers, or proletariat. It invites as inevitable and necessary the "class war," the object of which is the destruction of all classes except the proletariat, in whose interest and by whom future society will be organized with a view to production for use rather than for private profit.

Bolshevists differ from more moderate socialists by the literal interpretation they give to Marx's phrases. By the "class war," they mean actual warfare. They repudiate peaceful measures, especially parliamentary action, and advocate and employ violence for the immediate and complete attainment of the "revolution." They hold the political achievements of the last century and a half—political freedom, representative government, etc.—to be deceptive and illusory "bourgeois triumphs" inimical to the proletariat, since they have strengthened and extended the power of the propertied class.

The philosophy of Karl Marx, which was essentially "determinist," taught that the evolution of capitalistic society into communism is inevitable, through the process of the rich becoming richer and fewer in number, while the poor become poorer and more numerous. This irresistible development would go on until the overwhelming mass of mankind would be reduced to the class of proletarians, when capitalism would be "mature" and incapable of resisting its "capture" by the propertyless.

Envisioned as steps in the process were the organization of workers into unions, teaching them to act in concert, and periodic social distress arising from economic depressions. The Marxian analysis of capitalism held that the urge for profitable markets would precipitate "imperialist" wars, and that the resulting disorganization would lend opportunities for the proletariat to seize power. With each nation refashioned on a socialist pattern, Marx held, a world federation of co-operating republics would be possible.

Bolshevist Policy in Russia. The collapse of Russia in 1917 afforded the Bolshevists an opportunity to seize the power of the state, to destroy the opposition ("counter-revolutionists"), and to establish a communistic society on a gigantic, national scale. (See *Russia.*) The form of government set up to replace the constitutional and representative system was that of "soviets" (committees of propertyless workmen and soldiers) to which soviets or councils all power was attributed. (See *Soviet.*) All property was seized; all trading or commerce was penalized; all persons became the operatives or fellow laborers of the soviet state, which assigned to each individual or to his group its definite task and fixed the output or production required. An elaborate system of accounting and of control of industry was created. Severe penalties were visited upon recalcitrant bodies of laborers and upon peasant communities which failed to deliver the required production to the Soviet state.

The plan came near to being wrecked by the refusal of peasants to part with their produce. For a time the government compromised with a system of private profit. Then in 1927 began a ruthless effort to collectivize farming. State farms and co-operative farms were organized, many of them of enormous size, and the most improved types of machinery were used to work them. Private property was permitted to the extent of allowing each farmer to own enough land and animals to supply his own needs.

Other compromises with a rigorous communism were made by permitting different pay for different types of work and allowing individuals to accumulate property as long as this was not accomplished by using the labor of others to make profit. Five-year plans of national development were undertaken and carried through with a success that made Russia a rival of other great industrial states. The nation continued to advance economically throughout the great depression which plagued the rest of the world in the years following 1929.

Relation to Other Nations. The attitude of the Bolshevists at first was to expect a world-revolution within a short time. To bring this about they organized the "Third International" at Moscow in March 1919. Briefly successful Bolshevist revolutions were effected in several German states and in Hungary. These movements were ruthlessly suppressed. Definitely anti-Communist governments were set up in Italy and later in Germany. Meanwhile the attitude of Bolshevists toward the world revolution was modified. Aggressive propaganda was gradually discarded and peace abroad was cultivated. Instead of struggling for revolution directly, the government proposed to demonstrate in Russia the advantages of organizing economic life not for private profit but for public welfare.

This policy was changed in 1939, when Soviet Russia, in alliance with Germany, absorbed the Baltic states. After World War II the expansion continued, with the reappearance of the Comintern as the Cominform, and the capture by the Communists (the term now used) of the governments of countries bordering on Russia in Europe and Asia, and the organization of Communist parties, directed from Moscow, in other countries.

Bonus. Money paid in addition to a stated compensation. A bonus system, while common in private employment, is rare in public service and usually is adopted only when a sudden rise in prices recommends a temporary increase of government pay.

In the United States the term was used after World War I to describe payments by the national and state governments to former soldiers, as "adjusted compensation." Under the national measure, passed in 1924, over President Coolidge's veto, about four billion dollars was paid. After World War II most states granted bonuses to veterans.

Boodle. Money used in bribing public officials or in improperly influencing elections. The term also signifies plunder, or wealth improperly secured by officials through abuse of public office. It is said that the word "boodle" is derived from a Dutch colonial term meaning estate or inheritance.

Boss System. A term used in the United States to describe the method by which professional politicians, or "bosses," control nominations and elections to public office, and secretly direct the policy and conduct of government, particularly in states and municipalities.

The boss exercises power through a well organized "machine" of partisan workers who seek petty public office in exchange for services at primaries and elections. He frequently controls the candidates, whom his machinery elects, in their exercise of office. Thus the boss system has been aptly termed "invisible government."

The boss system has had its greatest development in the United States where frequency of elections and the number of elective officials overtax the interest of the average citizen.

Direct primaries, the initiative, the referendum, and the recall have been tried as methods of taking from the professional politician his pernicious power.

Bounty. A grant of land or money by the government to private individuals to reward services or encourage activities deemed of public benefit.

After the Civil War, large bounties in public land were given to the transcontinental railway companies to encourage the rapid extension of their lines and to hasten the development of the West.

Bounties frequently take the form of subsidies to owners of private merchant vessels, a flourishing merchant marine being regarded as a needed naval auxiliary in time of war.

Valuable bounties of land or money have often been given to induce enlistment in the military forces of a country, or to reward military service in time of war.

Brainwashing. The compulsory substitution of one body of political principles by another body through indoctrination or oppression, especially mental torture.

Budget. A detailed statement of the estimated expenditures and revenues for the ensuing fiscal period, submitted to the legislature by an officer responsible for the financial administration of the government. In England, where the budget system has been most completely developed, the chancellor of the exchequer prepares the budget showing the receipts from every source and the expenditures of each department for the year then expiring, together with estimated expenditures for the coming year, and a scheme of taxation for meeting such expenditures.

In the United States, satisfactory budget systems have come much later. American legislatures were long reluctant to let the executive branch of the government propose how moneys should be raised and spent. In 1921, Congress enacted a budget law whereby a director of the budget prepares, under the direction of the president, a budget for submission to Congress. California, New York, and many other states have entrusted similar powers to their governors. In 1933-34, the United States began the practice of dividing the budget into two parts, one showing estimates of current expenditures and income, the other, of sums chargeable to capital or other extraordinary outlays.

Absence of a budget results in waste, duplication of expense, and extravagance in appropriations. From the same cause follows lack of businesslike correlation between the raising and expending of revenues, and the absence of a definite responsibility for the financial administration of the government. See *Logrolling*.

Bureaucracy (*bū-rō'krà-sĭ*). Government by an elaborate system of administrative departments and officials, the lower functionaries subordinate in all matters to the higher. A bureaucracy generally tends to become unwieldy and laborious in its operation, through the absence of discretion in any but the higher officials. This produces "red tape" or over-systematization. Bureaucracy may exhibit also a tendency to disregard individual rights and to engage in arbitrary acts, but its most frequently charged defects are its rigidity, conservatism, and spirit of routine.

Cabinet Government. The form of government such as that of Great Britain, which is composed of a group of ministers, collectively called the "cabinet." Usually members of the cabinet are chosen from the leaders of the majority party of the Parliament or legislative body, and they are collectively responsible to that majority for the general policies and conduct of the government. As a rule, each member is the head of an administrative department.

Under systems of parliamentary government, the cabinet retains office only so long as it commands the support of the legislature.

Where there is more than one chamber in the national legislature, the dominant chamber, as the House of Commons in England or the Chamber of Deputies in France, is the one upon whose support the cabinet rests. Upon an adverse vote of that chamber on a material matter, the cabinet resigns.

Cabinet government, which is called also "parliamentary" or "responsible" government, differs fundamentally from "presidential" government as found in the United States. Here the president is the actual executive head. The cabinet is responsible, not to Congress, but to him. The president is responsible to the nation for his policies and his administration. Members of his cabinet are merely his advisers and subordinates.

Throughout Europe and in the British "dominions," cabinet government, responsible to a Parliament, has become nearly universal, but, almost without exception, the republics of the western hemisphere have followed the example of the United States, choosing their executives for a fixed term and making them independent of congressional direction.

Campaign, Political. Organized effort by a political party or group to secure the election of a particular candidate or list of candidates to political office. In the United States, formerly, the political campaign was marked by spectacular parades, campaign songs and slogans, immense gatherings of enthusiastic throngs, and by other devices calculated to arouse partisan interest and enthusiasm. More recently, however, political campaigns have been carried on principally by printed appeals, particularly through the medium of the daily newspaper.

In most American states, "direct primaries" or nominations by "primary elections" have taken the place of local and state nominating conventions. This has reduced party influence in political campaigns and has made them largely personal. It has at the same time doubled the effort necessary to secure election, as a candidate must compete at the polls twice, once for the nomination of his party and again for election to office. This system necessitates a large appeal to voters through the mails, by the circulation of personal appeals and "campaign literature," and has had the result of introducing a large element of expense not previously known.

Caucus. A meeting or conference of members of a political party or group to determine upon the candidate or policy to be supported in an election or other political contest. The term is American and is said to be derived from the Indian "kaw-kaw-was," meaning to counsel or confer.

A person entering a caucus is usually held to be honorably bound to accept the decision of the caucus, even though it be adverse to himself or to his views. He may, however, refuse to "caucus" with other members of his party or affiliation, thereby preserving independence of action and choice.

Census. An official enumeration of the population of a country, sometimes including also a tabulation of its industries and resources. In the Western world, the census is of Roman origin. In the time of Augustus, it was extended to the whole empire. The modern system, directed by the government, originated in Sweden in the 17th century. It was then adopted by France. No census was taken in Great Britain until 1800. Modern census-taking, however, may be considered to have originated in the United States. The Constitution provides that a national census shall be taken every ten years. The original purpose was to provide a basis for the periodical reapportionment of members of the House of Representatives, but the scope of the census has been extended to include the securing of data upon racial, religious, social, and economic conditions.

Charter. A grant from a sovereign or other superior authority to an individual, a company, or a territorial division, authorizing the exercise of certain functions or the enjoyment of certain privileges. In England, the crown often granted special charters to authorize individuals to exercise powers of government. Thus charters were granted to the proprietors who established colonies in America. Other colonies received direct charters from the crown empowering the people of the colonies to organize colonial governments. Similar "chartered companies" were created for extending British rule in Africa.

In the United States, charters may be granted for the creation of either public corporations or private corporations. The charter of a public or municipal corporation is today generally in the form of an act of the legislature, pursuant to which the corporation is organized, and which prescribes its form of organization and the powers which it may exercise. As a result, in England and America, municipalities have only such powers as are specifically enumerated in their charters or are bestowed by general laws. Incorporation is extensively used in the United States to create departments of government to carry on specific enterprises, the government owning all the stock. Examples are the Port Authority of New York and the Tennessee Valley Authority.

In the case of private corporations, it was the practice until about 1860 for legislatures to pass special acts for each private corporation created, and an act constituted the charter of the company in precisely the same manner as in the case of the public or municipal corporation. However, with the growth of the corporate form of business organization, the need of a special enactment for each private corporation burdened legislatures with private bills and led to political abuses. As a result, constitutional or legislative provisions were adopted in nearly all states, providing for the organization of private corporations under general incorporation laws.

Child Labor Legislation. See *Social Legislation.*

Chinese Exclusion. See *Immigration Legislation.*

Citizenship. The relation of an individual to his state, by which he owes obedience and loyalty, and in turn receives protection. The term as now used does not necessarily include the possession of political rights. Thus minors and women are citizens regardless of their right to vote.

In the United States, there is generally a dual citizenship: that of the nation and that of the particular state of which one is a resident. By express provision of the 14th amendment, as well as by the common law, any person born in the United States, of American parentage or of alien parents temporarily resident in the United States and therefore subject to its jurisdiction, is a citizen of the United States. Persons born of American parents on the high seas, or while such parents are temporarily resident abroad, are also citizens by birth. Children of diplomatic representatives of the United States, temporarily resident in a foreign land, are likewise citizens.

Citizenship in two different countries at the same time is technically possible and frequently occurs. Thus the laws of some countries provide that a citizen by birth ever continues to be a citizen of that country and cannot divest himself of allegiance. If such an individual becomes naturalized in another country, both his native country and the country of naturalization may then claim from him the duties of citizenship. Whether he is to be regarded as a citizen of one country or of the other may depend upon whether the question arises within the territory of the old citizenship or the new. See *Naturalization.*

City Government. Frequently spoken of as "municipal government." Legally, a city is an agent created by government for a definite local area, primarily for the satisfaction of local needs. In European countries generally, outside of Great Britain, and in some non-European countries, city government is also the agent of the state for the local administration of national affairs, and the chief executive of the city is responsible not only to the city government for the conduct of its interests, but also to the national government, whose agent he is. See *France.*

Municipal Authority. In Europe, city governments seldom enjoy autonomy or complete "home rule" but are subjected to supervision from higher branches of administration. This supervision usually applies to such matters as approval of municipal budgets, the granting of franchises and particularly to the exercise of the police power wherein the city is regarded as an agent of the state, discharging state functions. In Great Britain, and to an even larger degree in the United States, city governments are autonomous, free to vote moneys, incur indebtedness, grant public franchises, and engage in municipal undertakings without superior administrative sanction or direction. It is a fundamental principle, however, of British and also of American law that a city government has no inherent or "implied powers" but can legally undertake only thosel activities enumerated in its charter or sanctioned by genera laws. (See *Charter.*) In Great Britain, city government powers are altered or enlarged by acts of Parliament in what are called "private bills."

In Great Britain and in the United States, the courts may be invoked to restrain a city government from undertaking activities not specifically granted by law. In the countries of continental Europe, the range of the activities of municipalities is not exactly fixed by law; but a city, subject to superior administrative approval, is presumed to be competent to assume any undertaking for the better satisfaction of local needs.

In the United States and likewise in Great Britain, city government is usually confined to urban areas where the population is sufficiently dense to require that service which cities are organized to supply. The public needs of rural regions are taken care of by county government, the jurisdiction of which extends also over the cities. This leads to a certain duplication of public service within American cities, and, in a few instances, notably San Francisco, California, it has led to the creation of a special combined "city and county government."

State Control. In the United States, originally, state legislatures possessed complete power over city governments and could alter their charters at any time or subject them to special laws and administration. Abuse of this legislative power led to constitutional limitations upon state legislatures, forbidding them to pass special laws affecting municipalities. Furthermore, in a number of American states the freeholders or citizens of a city are permitted to frame and to adopt a special charter embodying their own choice of the principles of municipal government, and this charter, when ratified by the legislature, becomes the legal basis of city government.

City Planning. The orderly laying out of a city into industrial, mercantile, and residential sections, and the organization of its streets, parks, and public buildings, so as to obtain the maximum of convenience, health, and beauty.

The Roman cities were laid out on the "checkerboard plan" with streets at right angles and with a central square or plaza on which the principal public buildings fronted. During the Middle Ages such orderly layouts largely disappeared in much of Europe as cities were destroyed or decayed and a primary objective became defense against outside enemies. Protective walls were more important than convenient streets and sanitation.

Although the Roman system had survived in Spain and was followed in Spanish cities in the New World, it was not until the 18th and 19th centuries that advanced principles of city planning were adopted elsewhere. Philadelphia was laid out on the checkerboard plan. Later, in Europe, the central portions of Vienna and Paris were reconstructed at great expense to achieve impressive beauty, and wide boulevards replaced the ancient walls. In Paris, avenues radiating from central plazas provided vistas and shortened diagonal travel distances. Washington, D.C., was laid out on this plan with broad streets and beautiful parks.

By the mid-20th century, motor-car traffic and parking problems compelled drastic modifications in the large cities. Resort was had to roads passing above and below the street level with complicated ramps and interchanges, a system in which Stockholm and Los Angeles led the way. One interchange in Stockholm accommodates traffic on five different levels. In some cities, reconstructed after their destruction in World War II, certain central areas are reserved for pedestrians. See *Zoning Ordinances.*

Civic Center. The more important buildings of a municipality grouped together within an area conveniently accessible from all parts of the city form a civic center. By such grouping, an impressive architectural scheme is made possible and the transaction of public business is facilitated. See *City Planning.*

Civil Rights and Liberties. Civil rights are those explicitly conferred upon the citizens, subjects, or residents of a state by positive law, the enjoyment of such rights being secured by action of the state itself. Political rights, likewise conferred by law, are normally confined to citizens and include voting in public elections, holding office, serving on juries, etc. So-called "natural rights" are purely theoretical and have interest for the political scientist mainly because of their influence on revolutionary or reform movements or after they have been converted into civil rights embodied in positive law.

Growth of Modern Rights. As a matter of fact, civil rights as they exist in the Western world have been defined mainly by actual struggles of governed peoples for greater freedom against arbitrary authority, and they represent practical achievements in this direction. (See *Bill of Rights.*) The original home of most civil rights recognized in modern law was England; thence these liberties were carried to America by English colonists and there received an expansion and an emphasis through the American Revolution. From the United States these ideas were carried to France and there, by the French Revolution, were restated in the form in which they have been communicated to most peoples of the world.

Civil Liberty in America. American protection of civil rights was first incorporated in the Constitution in 1791 by amendments I to IX. After the Civil War, amendments XIII and XIV were adopted, the first in 1865 abolishing slavery and the second in 1868. The latter affirmed citizenship of all persons born in the United States and forbade states to make laws abridging the privileges or immunities of citizens. The purpose of these amendments was to erase the discriminatory after-effects of slavery, but this purpose was far from being realized.

Nearly a hundred years later, the Civil Rights Act of 1964 was adopted with the broad purpose of preventing political and economic discrimination based on race, color, religion, sex, or national origin. Article XIX (1920) had forbidden political discrimination based on sex. The new law widened this protection and extended protection also to religious and national-origin minorities. Specifically, discrimination was forbidden in registration and voting rights, in administration of government-financed projects, in employment, in schools, and in establishments serving the public, such as restaurants.

Enforcement is by the courts through civil suits by individuals, in which suits the government may intervene. The act sets up a Civil Rights Commission to investigate discriminatory practices and a Community Relations Service to assist in solving problems of discrimination. It undercuts discriminatory literacy tests by states for registration to vote by providing, among other things, that completion of the sixth grade is presumption of literacy.

Constitutional Protection. The United States has undoubtedly given a wider legal protection, particularly to the rights of property, than has any other country of the world. The Constitution, furthermore, has made these rights inviolable, not only by executive officers, but even by Congress or by legislatures. This condition has come

about through the supremacy of constitutional law over national or state legislation and through the practice of the courts, and particularly of the Supreme Court of the United States, in refusing to enforce statutes judged to be at variance with the Constitution. A vast body of judicial decisions defining and protecting civil rights has been developed by the courts of the United States and of the states.

Civil Service. This term includes, in its broadest sense, all positions under the government, Federal, state, and municipal, outside of the army and navy. Commonly, however, it is limited to administrative or executive positions, particularly to those that are appointed and are protected by legal safeguards against demotion or dismissal.

Beginning with the inauguration of President Jackson in 1829, for many decades the public service in the United States suffered from the carrying out of certain so-called "democratic" theories of government. The first of these was that public administration was not an expert function, but could be fitly discharged by any citizen, even though inexperienced and untrained. The second was the theory of "rotation in office," which demanded the frequent transfer of public position from one individual to another, on the theory that the right to hold office should be enjoyed by the largest possible number of citizens. It was further supposed that continuous employment led to neglect, indifference, and discourtesy on the part of public officials.

Civil Service Reform. These generally accepted political views, to which was added also the theory of "spoils" (See *Spoils System*), long deprived American government of an efficient body of public servants and resulted in a loss of efficiency and in the corruption of politics. An office-seeking class grew up, whose purpose was to control politics, national and state, for the purpose of securing office and using its power for private advantage. This experience, while discreditable to American politics, nevertheless prevented the development of an overbearing or autocratic official class. (See *Bureaucracy*) After the Civil War, active effort was begun to secure "civil service reform," or the placing of employment under the national government upon a "merit basis," open to all candidates, irrespective of party or religious affiliation. This movement was emphasized by the assassination in 1881 of President Garfield by a disappointed office-seeker.

The act of 1883 grouped Federal employees into three classes: (1) classified or competitive; (2) unclassified; (3) excepted and noncompetitive. The classified or competitive positions were to be filled by examinations under the direction of a "civil service commission" of three members appointed by the president with the approval of the Senate. Preference was given to persons "honorably discharged from military or naval service by reason of disability, wounds, or sickness incurred in the line of duty." Furthermore, a person holding a position in the competitive or classified civil service could not be dismissed without first being notified of the charges against him and given an opportunity to reply in writing. Since the enactment of this law, the class of competitive positions has steadily increased; and the proportion of unclassified and noncompetitive positions has diminished. Statutes similar to the act of Congress have been adopted in certain states, and similar provisions have been made by numerous cities.

Classified. Confidential government information which for reasons of national security cannot be divulged except to authorized persons.

Cloture or **Closure Rule.** Used in parliamentary bodies to close debate upon a bill or proposal, by moving "the previous question." The motion is made "that the question be now put"; and, in the event that this motion carries, the matter under discussion is immediately put to vote, without further debate. The term has its origin in the *clôture* (*klō'tür'*) of the French parliament.

In the British House of Commons, a modified form of the closure was adopted in 1882. The United States Senate is one of the few great legislative bodies which long refused to incorporate the closure in its rules of procedure. A minority in that body, by occupying the floor in continuous discussion and maneuvering, was, and still is, able to delay the passage of a bill until the emergency disappears, or the session comes to a close. This procedure is called "filibustering." In March 1917, the Senate adopted a closure rule, which somewhat controls filibustering. On the other hand, the absence of the closure rule prevents the majority from imposing a "gag rule" on the minority and permits a freedom of debate.

Coalition. An alliance of persons, parties, or states. The term coalition has been used repeatedly in European history to designate a league of states for offensive or defensive purposes.

Its more common use at the present time refers to the union of parties and to a government built upon such a coalition. The necessity for "coalition governments" arises in many countries through the fact that in their legislatures there are a number of parties or groups, and no one party possesses sufficient strength to form a government that will command the support of a majority of the legislature; hence an alliance or coalition of party elements is indispensable to the formation of a government.

During World War I and II, in order to present a united front for the prosecution of the war and to utilize, without distinction of party, the best statesmanship available, in most of the belligerent countries a party truce was declared and a coalition government was formed.

Cold War. A conflict between nations which does not involve the use of armed forces in combat, but is conducted by means of political and economic pressure and propaganda; a war of nerves.

Collectivism. A theory of economic and social organization in which all "productive capital" would belong to the community, and the share of each individual would be determined by the value or social utility of his contribution to the social income. Collectivism is practically synonymous with the generally accepted concept of socialism. See *Socialism* and *Bolshevism*.

Commission Government. A type of administration widely used in Great Britain and in America, whereby executive and sometimes legislative and judicial or quasi-judicial functions are entrusted to a number of individuals forming a board or "college." The theory of commission government is that responsibility for all decisions and directive action rests in the group, not in any one individual, and that all members of the group are officials with expert knowledge, presumably giving their entire time to the service of the office. In these respects, commissions differ from boards, which, in the United States, are frequently used as the legal governing bodies of institutions and are composed of laymen managing the public business through an executive appointed by and responsible to the board. Where, as frequently happens, a commission is given an ordinance or legislative power or the power of judicial review, such government represents an abandonment of the popular theory of "separation of powers."

Well-known types of commission government in England are the admiralty lords, who administer the British Navy, and formerly the lords of the treasury, although this commission has now become obsolete and its functions are exclusively exercised by another official, the chancellor of the exchequer. In the United States, the Interstate Commerce Commission, the Civil Service Commission, and public utility commissions in several states represent commission government. One of the most notable instances was the Philippine Commission of 1900-1907, which was vested, first by the president and subsequently by Congress, with the powers of governing and legislating for the Philippine Islands. In 1901, following the flood which destroyed the city of Galveston, Texas, the government of that municipality was entrusted to a commission of five citizens. The success of this experiment led to the general adoption in the United States of the so-called "commission plan of city government." See *Commission Form of Government*.

At times, in British and in American practice, an executive office ordinarily consigned to a single minister or public official may be entrusted to a group, in which case the office is said to be "placed in commission." Such a body created for one single purpose, either temporary or permanent, is in English practice described as an "*ad hoc* commission."

Common Law. The body of rules, principles, and forms of judicial proceedings which, while not enacted in statutes, have been immemorially recognized and enforced by the courts of England and by the courts of those countries which inherited their systems of jurisprudence from England. Thus it is distinguished from "statute law" or enactments of Parliament or state legislatures.

The common law is frequently used to mean English law, as distinguished from Roman or "civil law," which was revived and put into force on the continent of Europe at the beginning of the Renaissance period. In England, by reason of the king's courts, the common law at that time was making such progress as successfully to hold the field against the Roman law revival.

In some American states, only those principles and rules of the common law which were recognized before the 4th year of James I, when Virginia was settled, are regarded as having been carried over to the United States; but in most states the common law, together with certain fundamental statutes, as it existed at the time of the American Revolution, is regarded as forming a part of the law of such states.

Communism (*kŏm'ū-nĭz'm*). A system of social and economic organization in which property is owned by the state or group, to be shared in common or to be distributed among members of the community equally or in proportion to their respective needs. In communism, there is practically a complete abolition of the notion of private property; the property of each is truly the property of all. Thus communism goes much further than either collectivism or socialism, which proposes to bring all "productive capital," such as land, factories, mines, and railways, under public ownership. See *Bolshevism*.

Communism as thus described has been tried by small communities in Europe and America, but with little permanent success. The term has now become appropriated to the Bolshevist Marxist Socialism as developed in Soviet Russia by Lenin, Trotsky, and Stalin, and the political parties affiliated with it in other countries. See *Bolshevism*.

Concert of Powers. An understanding between the major European states for the enforcement of treaty provisions, for the maintenance of peace, for the control of minor states and peoples within the European system, and for the solution of Near Eastern problems. The concert may be said to have arisen about 1828. The "Great Powers" were, at the time of its origin, Britain, France, Russia, Austria, and Prussia.

The concert was broken in 1854 by the Crimean War, and again in 1871. The most imposing exhibition of the concert was the Congress of Berlin of 1878, which composed the affairs of the Balkans and the Ottoman Empire, reaffirming the sovereignty of Turkey in European possessions. Its arrangements gave Europe peace for an entire generation, and were not broken until 1908, when Austria-Hungary annexed Bosnia and Herzegovina. The concert was destroyed by the outbreak of World War I in 1914.

Congressional Record. The Constitution, Article I, Section 5, states, "Each house shall keep a journal of its proceedings, and from time to time publish the same, excepting such parts as may, in their judgment, require secrecy." The proceedings of the House and Senate are published daily when Congress is in session in the *Congressional Record*.

Conscription. The compulsory enrollment of citizens or inhabitants of a country for filling its military forces. Also called "the draft" or "compulsory military service."

While compulsory military service is of ancient date, the French Revolution initiated the plan of commanding the entire manpower of the nation for national defense. The National Assembly in 1792 decreed the *levée en masse*. While this hurried assembling of untrained men proved ineffective, it led to the practice of vast drafts upon the able-bodied men of the nation for the Napoleonic wars.

European Systems. The system of compulsory training of all able-bodied young men originated in Prussia, after the overwhelming defeat of that country by Napoleon in 1806. Napoleon limited the standing army of Prussia to a force numerically ineffective. Prussia met this condition by the brief but thorough training of this limited number of men and by their prompt retirement into a reserve, which could be "mobilized" or called to the colors at any crisis and would thereby many times augment the limited standing army. Out of this incident have come the modern systems of compulsory training which, before World War I, had been adopted by most European countries and Japan.

In Germany, the system was carried out in the most thorough way. Theoretically, all men were trained for appropriate duty in time of war and were classified into several categories: those undergoing active training; those in a first reserve, to be immediately mobilized on the threat of war, each man joining an assigned battalion or other unit; a *landswehr*, or second reserve, of older and less active men; and finally a *landsturm*, composed of men in middle life no longer judged capable of front-line duty, but serviceable for duty on lines of communication, for garrison duty, and for home guards. Great Britain had at times practiced unsystematic "impressment" of men for the army and navy, depending generally on voluntary enlistment. World War I forced her to the Conscription Act of 1916. Peacetime conscription was begun in May 1939, and there was rigorous conscription in World War II.

American Conscription. The United States has four times resorted to conscription and involuntary enlistment. During the Civil War, the Northern states, in 1862, the Southern states earlier, adopted compulsory enlistment. On the entrance of the United States into World War I in April 1917, a selective draft act was passed by Congress which required the enrollment for military duty of all men between 21 and 31, the act being subsequently extended to include all men between 18 and 45. From these a selective draft was made for active service. September 16, 1940, the Selective Training and Service Act authorized the first peacetime draft in American history. It provided for the induction of males between 21 and 36 to be trained for one year for national defense in the Western Hemisphere. By later enactment the time and area of service were extended. Men from 20 (later 18) to 65 were required to register, and men up to 45 were liable to induction, except certain officials and clergymen. But men in certain key industries, men with dependents, or physically disabled, might be deferred. Provision was made for conscientious objectors. The selection was made by local boards on the basis of a lottery conducted after the first registration, and contested cases might be taken to appeal boards. In June 1948 the Selective Service Act was revived. It lasted until the American disengagement from Vietnam in January of 1973. At that time the U.S. converted to all-volunteer armed forces.

Conservation. The term applied to the policy of government regulation of the use and development of the natural resources of the country so as to prevent their rapid and wasteful exhaustion by private ownership. Conservation further aims to provide a systematic development of such resources in the interests of the general public and for the benefit of later generations. See *Public Lands Policy*.

Constitution. A constitution is a fundamental or "organic law," upon which the government of a nation rests. To be theoretically complete, a constitution should provide a structure of government; an enumeration of civil rights and liberties (See *Civil Rights and Liberties*); and a provision for its own amendment. The amending provision has special significance, since it may be assumed to disclose the sovereign power within the state; for that power which is above the constitution, and which may alter or repeal it, may fairly be regarded as the "legal sovereign."

The modern practice of adopting "written" or "rigid" constitutions as a basis for national or state government is of American origin and is one of the political achievements of the nation that has been generally borrowed the world over. The earliest constitutions of this typical form were those adopted by the American states, when, by the Declaration of Independence in 1776, they ceased to be colonies of Great Britain. These were followed in 1789 by the Constitution of the United States. (See *Constitution of the U.S.*) Nearly every government in the world today rests upon a written constitution, either granted by a monarch or framed by a national convention.

Great Britain has what is called an "unwritten constitution," in that a large part of it is not in written or statute form, but is a matter of practice. Furthermore, the various statutes underlying the government of the realm have never been codified or unified in a single document; also, it is a fundamental principle of the English constitution that it can be changed in any respect by a simple act of Parliament. In this sense, no act of Parliament is more fundamental or organic than any other. This character gives to the British constitution a flexibility not possessed by that of the United States.

The period of active constitution-making in Europe began with the French Revolution, when numerous constitutions were devised, many of them on highly theoretical lines, and a number successively put into operation. From Europe, the revolutionary movement passed back to the Spanish colonies of America, where an active process of constitution-making arose, greatly influenced by the constitutional forms of the United States.

Following the revolution of 1848, European countries generally attained constitutions or fundamental laws limiting monarchical power and increasing the political participation of the people. A new and extremely active period of constitution-making followed the end of World War I in 1918, when many new states came into existence and when older constitutions were subjected to radical revision.

Consul. A representative of a government in a foreign country, particularly for commercial purposes and for the aid and protection of its citizens abroad. The duties of a consul include the making of reports on commercial conditions in the country to which he is assigned, various services in connection with the landing of vessels at foreign ports, the relief and protection of citizens of his country in times of distress or disturbance, and other duties, even including those of a diplomatic character in the absence of an ambassador or a minister.

For the judicial functions exercised by consuls, see *Extraterritoriality*.

Contraband. Primarily, articles sent from a neutral to a belligerent country in time of war for military and naval use. Under generally recognized laws of war, such merchandise may be seized and confiscated if taken upon the high seas or within enemy territory. Ordinarily, confiscation follows the judgment of a prize court, in which the neutral owner may have the right to appear and to defend his title and interest. Formerly, the list of articles generally recognized as contraband was limited, and embraced mainly arms and military supplies. World War I, however, so completely engaged the entire resources of the belligerent nations that it led to a great expansion of the list of contraband goods. At present it would be difficult to say what is not contraband in time of war.

Convention, Political. A gathering of party adherents or delegates for the purpose of selecting candidates for public office, for declaring their body of political principles or "platform," and for organizing party administration.

Political conventions were a relatively late development of American democracy. In the early decades of the Union, candidates were nominated in various ways, a caucus of members of the same party in Congress usually choosing the national candidates. After 1832, the national political convention became the accepted method of nominating candidates for president and vice president.

In the states, it was formerly the universal practice to hold not only state conventions for nominating candidates

for state offices, but county conventions and local primaries. The place of these conventions in American political life has been greatly reduced in recent years by primary election laws. The national party convention, however, meeting once in four years, shortly preceding the presidential election, continues to be a political institution of first importance, although almost entirely unrecognized by federal laws. Each party, by its own rules, determines how delegates shall be chosen and how the business of the conventions shall be conducted. Election as a delegate to a national convention is an eagerly sought distinction, and, preceding and during the days of their meeting, such conventions overshadow other matters of national interest. The greater part of the time during which a national convention meets is usually devoted to the nomination of, and the successive ballotings for, candidates for the presidency and the vice presidency. This is accomplished by a majority vote of all delegates present. The Democratic party adopted this rule in 1936 after having, since the party's origin in 1832, required a two-thirds vote for nomination.

Besides nominating its presidential candidates, the convention adopts a party platform and, before adjournment, chooses the national committee, made up of one representative from the party organization in each state. The national committee has great power over the organization in the period between conventions.

Corporate Campaign Contributions Legislation. In January 1975 a U.S. federal election campaign-funding reform bill became effective. The bill, signed into law in October 1974, was intended to eliminate improper and excessive influence by large campaign contributors. This action was taken due to the campaign-funding abuses revealed during the Watergate investigations. The bill placed ceilings on contributions by individuals and by organizations and prohibited cash contributions over $100. Individual contributions to all federal candidates and their organizations were limited to $25,000 in any election year; to any one presidential candidate, $1,000; and to any one Congressional candidate in any one election (primary, runoff, or general election), $1,000. Organization contributions to presidential candidates were limited to $5,000 and to Congressional candidates, in each election, $5,000. The bill also provided for: public financing of presidential primaries and elections; spending ceilings for presidential and Congressional campaigns; establishment of a six-member commission to supervise the enforcement of the law; and the reporting, by presidential and Congressional candidates, of all contributions and expenditures.

Corporate State. A term applied to such governments as those established by the Fascists in Italy and the Nazi party in Germany. Totalitarian is sometimes used as a synonym. The idea behind the word is that the nation consists of one class, or body (Latin *corpus*, "body"), and not two classes, the workers and exploiters, as the Marxian Socialists contend. Implied in the word also is the absence of political parties, all those except the ruling one being suppressed.

Court Martial. See *Military Law*.

Creed, The American's. Written by William Tyler Page, Clerk of the U. S. House of Representatives, in 1917, and adopted and promulgated by the Government's Committee on Publication. Accepted by the House of Representatives, on behalf of the American people, April 3, 1918.

De Facto Government. A government actually exercising governing power in a particular territory, irrespective of its legal authority. *De facto* government is distinguished from *de jure* government, the latter being a government which exists by legal right or by international recognition.

Democracy. Democracy signifies popular government. It has been defined in Lincoln's phrase, "government of the people, by the people, and for the people." It is distinguished from monarchy, in which the head of the state is a king or prince, and from aristocracy, or government by a privileged or superior group. None of these words is used with entire consistency or exactness in political writings. By democracy is sometimes meant direct popular government rather than government by chosen representatives, and a distinction is then drawn between a democracy and a republic. Few of the new countries established as republics after World War II were democracies.

The word democracy is used also to indicate not only a government which is immediately or ultimately controlled by popular opinion or by the majority of the people, but also one in which society is distinguished by an absence of privileged and aristocratic classes. The theory of democracy rests upon an assertion of the worth of the ordinary man and woman and upon a confidence in the good judgment and moral rectitude of common people; upon the belief that if unwise or wrong action prevails for a time, in the long run the common sense of the bulk of society will recognize and correct the evil. Democracy further rests upon the conviction that the interests of all classes are better served when they are politically controlled by all classes rather than by a single class.

Diplomatic Representation. Diplomacy is the art and the practice of international negotiation. In the early history of Europe, such negotiations were intrusted to special heralds, ambassadors, or missions. The system of keeping diplomatic representatives resident in the important countries with which they had friendly relations was first practiced by the Italian city-states and particularly by Venice.

Such representatives are of different ranks; by the Treaty of Aix la Chapelle, 1818, they were classified in the following four grades: (1) ambassadors, including papal legates and *nuncios*; (2) envoys extraordinary and ministers accredited directly to the sovereign; (3) ministers resident; (4) chargés d'affaires. The first three grades are accredited to the head of the state; the fourth, to the minister having charge of foreign relations. Consuls, when charged with a diplomatic mission, rank with the chargés d'affaires.

Embassies. "Embassies" are established between nations whose mutual interests are of importance; elsewhere the diplomatic office is usually a "legation."

In 1976 the U.S. had embassies to 136 countries. These states, also maintaining embassies at Washington, were as follows: Afghanistan, Algeria, Argentina, Australia, Austria, Bahamas, Bahrain, Bangladesh, Barbados, Belgium, Benin, Bolivia, Botswana, Brazil, Bulgaria, Burma, Burundi, Cameroon, Canada, Central African Empire, Chad, Chile, China (People's Rep.), China (Taiwan), Colombia, Costa Rica, Cyprus, Czechoslovakia, Denmark, Dominican Rep., Ecuador, Egypt, El Salvador, Ethiopia, Fiji, Finland, France, Gabon, The Gambia, German Democratic Rep., Germany (Fed. Rep. of), Ghana. Greece, Grenada, Guatemala, Guinea, Guinea-Bissau, Guyana, Haiti, Honduras, Hungary, Iceland, India, Indonesia, Iran, Ireland, Israel, Italy, Ivory Coast, Jamaica, Japan, Jordan, Kenya, Korea, Kuwait, Laos, Lebanon, Lesotho, Liberia, Libya, Luxembourg, Madagascar, Malawi, Malaysia, Maldives, Mali, Malta, Mauritania, Mauritius, Mexico, Morocco, Mozambique, Nauru, Nepal, Netherlands, New Zealand, Nicaragua, Niger, Nigeria, Norway, Oman, Pakistan, Panama, Papua New Guinea, Paraguay, Peru, Philippines, Poland, Portugal, Qatar, Rumania, Rwanda, São Tomé and Principé, Saudi Arabia, Senegal, Seychelles, Sierra Leone, Singapore, Somalia, South Africa, Spain, Sri Lanka, Sudan, Surinam, Swaziland, Sweden, Switzerland, Syria, Tanzania, Thailand, Togo, Tonga, Trinidad and Tobago, Tunisia, Turkey, U.S.S.R., United Arab Emirates, United Kingdom, Upper Volta, Uruguay, Venezuela, Western Samoa, Yemen, Yugoslavia, Zaire, Zambia.

The terms "embassy" and "legation" are used also for the residence or buildings of the minister and the staff. The official residence of an ambassador is known as an "embassy"; that of a minister, as a "legation."

Diplomatic Credentials and Privileges. A diplomatic agent is usually accompanied by an official suite which may include counselors, secretaries, attachés from the army or navy, commercial attachés, interpreters, etc. A diplomatic representative carries a recommendation called a "letter of credence" and also, usually, a "letter of instructions" conferring full powers for the closing and the signing of a treaty, and a special passport. On arrival in the country to which he is accredited, he is accorded an official reception by the head of the state, if he is ranking in one of the first three classifications, and by the foreign minister if he is a chargé d'affaires. A diplomatic representative is accorded certain immunities and privileges which extend to members of the household and suite. These include inviolability of person and residence—an assault committed upon him is an injury to his nation and must be correspondingly compensated for (See *Extraterritoriality.*)—exemption from local jurisdiction; and exemption from taxes on personal property or official residence. From the immunity of a diplomatic representative has arisen the "right of asylum" or of taking shelter in a legation.

It is a general principle that a diplomatic representative must be acceptable to the state to which he is sent, or, if his conduct becomes objectionable, that he may be sent home. This is usually done by the formality of furnishing passports. (See *Persona Non Grata.*) Diplomatic relationship is always terminated on the outbreak of war, and it may also be broken off as a protest threatening war.

The act of accrediting a diplomatic representative to a government is equivalent to recognition of that government, so that, where recognition is withheld, countries intrust the preservation of their interests to a representative of lower grade than an ambassador or minister or to a personal representative. See *Personal Representative.*

Direct Legislation. A term used to describe the enactment of law by popular vote rather than by representative legislative bodies. Direct legislation has been frequently practiced by local communities, from the Greek cities down to New England town meetings. In certain of the Swiss cantons, it still exists in the form of popular meetings for legislative enactments. It was in Switzerland also that the modern method of direct legislation by organized balloting

arose. Thence, in the form of the popular proposal of laws (initiative) and the popular ratification or rejection of laws (referendum), the institutions of direct legislation have spread to other countries and particularly to the United States.

In another form, however, direct legislation in America is older than in Switzerland, that is, in the direct vote of the people upon constitutional or organic laws, which originated in Massachusetts in 1780.

Due Process of Law. The federal Constitution, in both the 5th and 14th amendments, and all state constitutions, contain provisions protecting the individual against the deprivation of "life, liberty, or property without due process of law."

The due process clause of the 5th Amendment operates as a limitation upon the action of the federal government only. But the similar provision, which was added to the Constitution by the 14th Amendment in 1869, expressly protects every American citizen against the unlawful infringement of his life, liberty, or property by the action of any state. The latter provision of the federal Constitution, although originally intended as a means of safeguarding the independent status of the Negro, has been construed by the courts as operating to the benefit of every citizen of the United States whatever his race or color. This clause has been the basis upon which the Supreme Court of the United States has declared unconstitutional numerous acts of state legislatures, particularly laws limiting freedom of contract.

Fundamentally, due process of law is merely that judicial procedure "which hears before it condemns, which proceeds upon inquiry, and renders judgment only after trial." As developed by the courts, however, the phrase has come to have a broader significance. It appears to signify the protection under the law of every individual against arbitrary and unreasonable acts of the executive and legislative branches of the government.

Elder Statesman. A retired statesman who because of his experience in public affairs is sometimes called upon to give unofficial advice on current issues, especially to government officials.

Electors, Presidential. The framers of the Constitution of the United States believed that the direct popular election of the president was both impractical and undesirable. They therefore provided for an indirect election of the president and the vice president by special electors, who were intended to be a select body of individuals possessing a broader acquaintance with men and a better understanding of national issues than the ordinary voter. The Constitution provides that each state shall appoint "in such manner as the legislature thereof may direct" a number of electors equal to the state's quota of senators and representatives in Congress.

The electors chosen in the manner provided by each state legislature were thereafter to meet in their respective states and to cast their ballots for two persons. Since the adoption of the 12th Amendment, in 1804, each elector is required to designate his choice for president and for vice president. Electors meet in each state on the first Monday after the second Wednesday in December to cast their ballots. The vote thus taken is transmitted to the president of the Senate, who, on January 6 in the presence of both houses of Congress, opens the certificates and counts the ballots from all states.

The choice of the president and the vice president by electors as thus provided has become largely a matter of form. Since 1800, the electors have generally followed the dictates of the parties to which they have belonged. Electors are expected, as a matter of course, to cast their ballots for the regular party nominees although they are not legally required to do so. A vote for a particular elector is in effect a vote for the party's nominees. In some states, however, the names of the party nominees with or without electors' names appear on the ballot.

Embargo. An order or act of a country, prohibiting vessels or merchandise from leaving its ports. The purpose of an embargo, ordinarily, is to injure another country by depriving it of its usual commerce. Where the embargo applies only to the vessels or goods of a country's own citizens, it is a "civil embargo." Where the prohibition applies also to the vessels of a foreign state against whom the embargo is particularly directed, it is a "hostile embargo." Where the embargo applies to the vessels and goods of all nations found within the ports of a country, it is an "international embargo."

Eminent Domain. The pre-eminent right of the sovereign to all of the property within its jurisdiction, by virtue of which it may appropriate any of such property, howsoever owned, to public uses. A limitation upon this right, fixed or implied in all constitutional governments and expressly incorporated in the Constitution of the United States and in the constitutions of all of the states, is that private property shall not be taken for public use without compensation.

Among the public uses for which the power of eminent domain is most frequently exercised are the creation of streets, parks, forts, docks, and public buildings. The right may be delegated by the state to public service corporations, such as railroads, telephone and telegraph companies, or corporations serving the public with water, gas, electricity, and similar utilities, which are regarded as quasi governmental functions.

Expatriation. See *Naturalization*.

Export Tax. The Constitution of the United States (Article I, Section 9) provides that "no tax or duty shall be laid upon articles exported from any state." This limitation upon the federal government does not deprive it of the power of declaring an embargo or of otherwise regulating exports, nor does it deprive Congress of the power of imposing a tax on income derived from exports. Trade between the United States and its insular possessions, such as Puerto Rico, has been held not to be foreign commerce; but a tax laid by Congress upon such trade is not prohibited by this section of the Constitution.

The Constitution (Article I, Section 10) also prohibits the states from levying any duties on exports or imports, except such as are necessary for the execution of its inspection laws, and then only subject to the control of Congress. The effect of this provision has been to deter the states entirely from such legislation and to maintain complete free trade between states of the Union.

Ex Post Facto Law. Retroactive legislation which makes punishable an act which was lawful when committed or imposes for an unlawful act a more severe punishment than was provided by law at the time the act was committed, or otherwise retroactively affects, to his material disadvantage, the position of one accused of a crime.

The Constitution of the United States forbids both the federal government and the governments of the states from passing any *ex post facto* legislation.

Extradition. The surrender of a fugitive from justice by one country or state to the authorities of another. Nearly all civilized countries have entered into treaties with one another providing for the extradition of persons who have committed specified crimes in one country and have then fled to another. Common limitations in these treaties are that the duty of a nation to surrender such a fugitive shall not extend to its own citizens and that persons extradited shall be tried only for the crime specified in the request for extradition. A further limitation which the United States has inserted in its treaties is that it shall not be compelled to give up persons charged with political offenses.

Extradition between nations is effected by a request of the state or foreign office of one nation upon the state or foreign office of the other. The Constitution of the United States contains an express provision requiring every state to extradite, upon demand of another state, any fugitive from justice (Article IV, Section 2). In extradition among the states of the Union, there are no limitations with respect to the character of the crime or the citizenship of the person whose extradition may be sought. A requisition signed by the governor of the state from which the accused has fled is addressed to the governor of the state in which the accused is found, and, if honored by the latter, the person is surrendered. Not infrequently, however, a governor refuses to surrender an alleged fugitive from justice, on the ground that he will not receive a fair trial in the state where he is indicted. And, although the Constitution is mandatory with respect to delivering up offenders to sister states, the Supreme Court has refused to compel the extradition of a fugitive whose surrender a governor has denied.

Extraterritoriality (*ĕks'trà-tĕr'ĭ-tō'rĭ-ăl'ĭ-tĭ*). An immunity from its general jurisdiction granted by a state to the representatives or subjects of another state within its own territory. Such immunity extends, by the practices of international law, to sovereigns sojourning in an official capacity in a foreign country. The sovereign and his retinue are exempted from civil and criminal jurisdiction and from police and administrative regulations, as well as from the payment of taxes and from the performance of other duties imposed upon ordinary residents. A similar exemption is accorded by all nations to the diplomatic representatives of other states accredited to them. (See *Diplomatic Representation*.) Any foreign army within the territorial limits of a state, with that state's permission, is free from its jurisdiction, and, when a foreign vessel of war, without inconvenience to a state, enters or remains within its maritime jurisdiction, the vessel and the crew are ordinarily accorded an immunity from local jurisdiction.

Extraterritoriality may have, furthermore, a much wider scope. It was customary for European nations, in negotiating treaties of commerce with Oriental countries and in arranging for the residence of their citizens within these countries, to obtain for their citizens rights of extraterritoriality. By these treaties, foreign citizens are triable, not by the courts of the country in which they reside and travel, but by courts of their own government, usually of a consular character.

In Japan, the right of consular jurisdiction, with other privileges for American citizens, was obtained in the

treaty negotiated by Commodore Perry in 1858. This action was followed by similar concessions to other Western nations. Following the reorganization of Japan, that country zealously sought the abolition of these extra-territorial rights, which were properly considered prejudicial to her sovereignty, and, after the modernization of her courts and codes of law, extraterritoriality was relinquished by all foreign states from July 1899. Similar rights existed in China, where the United States in 1906 created the "United States Court of China," with jurisdiction over its own nationals. Great Britain had a similar court, established in 1865. In 1943 these countries relinquished their extraterritorial rights by treaties, and Sweden and Belgium took similar action.

Favored Nation Clause. A provision found in treaties between practically all modern countries. It assures to the citizens of a foreign state all such privileges within the territory of another state as may at any time be accorded to the citizens of the "most favored nation."

Favorite Son. A person who is politically popular in a particular locality, large or small. Local candidates who have the backing of their state delegations at presidential nominating conventions are known as favorite sons. The vote for them is usually complimentary, but there is always the hope that in case of a deadlock the favorite son will be chosen.

Federalism. A system of government wherein the political powers of the state are constitutionally distributed between the national government and the local governments of member units which are called "states," "provinces," "cantons," etc. Federal government is distinguished from "unitary" or "centralized" government. In centralized government, the whole authority is vested in the central or national structure; local governments have no constitutional independence or autonomy, but are vested with functions by act of the central government itself and are subordinate to the central government.

The term federal refers to the government, not to the "state." It is politically incorrect to speak of a "federal state," or of a "divided sovereignty" in the state, since sovereignty, by its philosophical conception, is divisible.

A federal government or a "federation" differs from a "confederacy" or a "confederation" in that it is actually the government of a sovereign state, whereas a confederation is a union of states in which sovereignty or state independence resides in the member states themselves The one is a "perfect union;" the other, a league. In a confederation, the member states reserve the power of withdrawing from the union, and their consent must be implied or assumed to actions taken by the confederate government. A federal government is an "indissoluble union" which can be disrupted only by successful rebellion or revolution. The authority of the government in a federation is direct upon the citizens of all member units, and allegiance is primarily to the federal union and secondarily to the member units.

The United States of America is the first federation in the modern sense. Its success is attested by its long history and by the development of other federations, largely inspired by the American Union. See *Argentina, Australia, Brazil, Canada, Mexico, Switzerland, Union of South Africa, Venezuela.*

A federal government usually arises out of the union of previously independent states or governments and the creation of a new national government through this union. The act of union preserves as separate local governments the unit members of which have merged. Usually the powers bestowed upon the federal government are specified and enumerated, all others being reserved to the states or provinces. In the case of the Canadian federation, however, the reverse principle holds, where the provinces have enumerated powers.

The federal principle has been applied also in countries having elements with strong local attachments and presenting differences of type. The chief example is Russia, where autonomy was granted to diverse regions, yet without sacrificing central authority over national policies.

Fellow Traveler. Originally a person who, though not actually a member of the Communist party, was in sympathy with its principles and willing to co-operate with it.

Filibuster. One who engages in an unlawful military expedition into a foreign country. The word is derived from the Spanish *filibustero* which, besides connoting a "freebooter," is used also as a term of contempt for a seditious plotter.

In parliamentary slang, "filibuster" is used to designate measures employed to prolong debate and to prevent a vote. See *Closure Rule.*

Franchise Tax. A tax either upon the privilege or franchise granted by a state to a corporation empowering it to act as a legal body, or upon a special franchise granted to a public-service corporation permitting the use of the public streets or other public places for the business of the corporation.

States cannot impose a tax upon the general franchise of a corporation created by the Federal government. Nor can any state impose upon a corporation, organized under the laws of another state, a tax which is calculated upon the entire capital stock of the corporation, the courts holding that this constitutes an attempt to tax property not within the jurisdiction of the state.

Franking Privilege. A privilege possessed by members of Congress, as well as by members of other branches of the Federal government, of sending official mail free of charge.

Free City. The early states of the Mediterranean and Ægean seas were "city-states." Political life was confined to the urban community; the surrounding land, usually of limited extent, was subordinate and tributary to the city. Such were the ancient Greek states, and such in the beginning was Rome. The development of medieval commerce and manufacture again brought the city to the front, and the Italian cities, such as Venice, Florence, and Genoa, became free and independent states. In the north, the Flemish and Baltic cities, and also those of the Rhineland, attained comparable freedom of government, although nominally each was under the sovereignty of some greater political authority.

These free cities frequently leagued together in a confederacy or "hanse," for mutual protection and defense of commercial rights. The most famous of these associations was the Baltic or Teutonic Hanse, under the head of Lubeck. The development of nationalities broke up these leagues and brought the free cities under national authority. Three,—Lübeck, Bremen, and Hamburg,—retained their freedom as members of the second German Empire. The Treaty of Versailles created two free cities, Danzig and Fiume. Fiume was absorbed by Italy in 1924; Danzig by Germany in 1939. In January 1937, Hamburg became "Hansa City, Hamburg," and Lübeck was annexed to Prussia. See *Hanseatic League* and *Venice and the Hanse.*

Freedom of Contract. Political and economic thought at the close of the 18th century and at the beginning of the 19th century favored the complete freedom of the individual, both to employ labor and to accept employment, without interference from the state or coercive influence of other individuals. Economic teaching held that attempts on the part of public authority to limit industrial or commercial competition interfered with the law of supply and demand and violated fundamental personal rights.

Changed industrial relations and the sufferings and abuses arising from unrestrained competition have revealed the necessity of considerable limitation of the so-called right to freedom of contract. This right, although specifically protected by the United States Constitution, has always been regarded as subject to the "police power"—the regulation or limitation of actions in the interest of the public health, safety, and morals. Much of the social legislation of the 20th century, limiting hours of labor, prescribing working conditions, and fixing minimum wages, has met with the objection that it infringes freedom of contract. In most instances, such legislation has been upheld by the supreme court of the United States as within the police power of the states or the commerce power of the nation.

The conception of the police power has undergone marked extension, and the once unchallenged right to sell one's labor in the dearest market or to hire at wages and terms that take no care for the safety, health, or comfort of the employed has been greatly abridged. Freedom of contract between employer and employed has further been restricted by the growth of labor unions and by the practice of collective bargaining. See *Social Legislation.*

Freedom of Religion. The first amendment to the United States Constitution and similar provisions in state constitutions guarantee freedom of worship as a fundamental right. This right, however, does not permit the individual to engage in practices which are regarded as inimical to the health, morals, or safety of the state.

Thus bigamy may be made a crime and may be punished as such, even though plural marriage be a tenet of a particular faith. A person is not excused from compulsory military service because his religious faith forbids bearing arms. A state may make it a crime for a parent to refuse to obtain medical attention for a child because of religious conviction that bodily ills can be cured only by religion.

Freedom of Speech. Freedom of speech and of the press was one of the established rights of Englishmen; it was transported to America by English colonists and is protected by the United States Constitution.

This right in ordinary times extends to the free criticism of the government itself, and even to advocacy of revolution. Justice Holmes, in the case of *Abrams* vs. *United States*, said:

"We should be eternally vigilant against attempts to check the expression of opinions that we loathe and believe to be fraught with death, unless they so imminently threaten immediate interference with the lawful and pressing

purposes of the law that immediate check is required to save the country."

Picketing and use of handbills in labor disputes have been protected by the supreme court as an exercise of the right of free speech.

The right, however, is not without limitation. Criticism that unduly hinders the government in the performance of its proper functions has been held by the same jurist to be illegal and punishable. "The question in every case is whether the words used are used in such circumstances and are of such a nature as to create a clear and present danger that they will bring about the substantive evils that Congress has a right to prevent. It is a question of proximity and degree. When a nation is at war, many things that might be said in time of peace are such a hindrance to its effort that their utterance will not be endured so long as men fight, and that no court could regard them as protected by any constitutional right." (*Schenck* vs. *United States*).

The historical origin of this guarantee was as one of the moral and legal weapons used in the fight against absolute monarchy. Subsequent events have shown that the right can be maintained only when the existing social and political order is firmly established and felt to be in no danger. For this reason transition stages between contrasting regimes are marked by the suppression of this right.

Free Port. An area at a gateway of foreign trade which a government permits to remain outside tariff walls. Goods may be brought there from abroad without payment of duty, this being levied only when the commodities pass from the free port to other parts of the country.

Advantages include the possibility of avoiding tariff payments in processing materials brought from abroad into commodities to be sold abroad. Free ports make possible also displays of foreign merchandise for inspection of importers, without payment of tariff duty.

The United States Congress in 1933 authorized the establishment of free ports. The first to be set up was in Staten Island at New York, N. Y., where an area of 78 acres is devoted to the purpose.

Free Trade. See *Tariff*.

Functional Representation. A plan for representation in political bodies, based upon occupational or class groups rather than upon territorial units or electoral districts. Functional representation is an old institution, and parliamentary development sprang from the assembling of representatives of the different classes of medieval society. These representatives at first sat in separate bodies and deliberated and voted apart. Constitutional development in western Europe, however, has tended to draw these classes together into single chambers and to obliterate occupational divisions.

In the United States, parties have been composed of people of all walks of life. Neighborhood interests and local and sectional attachments have been the potent influences in stirring people to political activity.

As government has become more and more closely associated with economic controls, however, voters have tended to divide according to their economic interests. This explains the rise of labor parties, Socialist parties, agricultural blocs, and similar political groups that speak for economic classes. The tendency has increased in democratic countries since World War I, but actual elections continue on a local basis, with few exceptions.

The most extreme form of functional representation was found in Fascist Italy, where 22 separate councils combined in the National Council of Corporations each represented workers and employers in one division of industry. Legislation by this body, however, related mainly to industrial questions.

Fusion. A coalition or combination of political parties or groups for the purpose of defeating another party or group; e.g., of Republicans and independent Democrats in New York City against Tammany Hall or of Republicans and Democrats against socialist candidates.

Geopolitics. The application of the study of geographical influences to the determination of political objectives. Based on the geographic studies of Ratzel in Germany and Mackinder in England, it was applied in its German form *Geopolitik* by Haushofer to justify German expansion and to indicate the political and military strategy dictated by geography. It teaches that space and the contents of space determine everything. A central idea is that of the "Heartland" (eastern Europe) and the advantage over maritime empires given its possessors by improvements in air and land transportation.

Gerrymander (*gĕr'ĭ-măn'dĕr*). A form of political sharp practice, whereby electoral districts are so laid out that the party in power will possess a majority of votes in as many of them as possible.

The practice has produced districts of very eccentric appearance, one of which, attributed to Governor Gerry of Massachusetts in 1812, being likened to a salamander, was wittily dubbed a "gerrymander"; hence the name.

Government Ownership. This term is usually applied in America to the acquisition and operation, by a state or municipality, of public utilities, such as railroads, street railways or bus lines, telephone and telegraph systems, and gas, water, and electric companies.

The impetus toward public acquisition of such properties usually comes from the belief that companies having a monopoly interest in them are charging excessive rates. Public control of rates is frequently difficult because involving long and expensive litigation. Commissions set up to regulate rates are often felt to adopt a neutral attitude instead of being spokesmen for consumers. In many cases also there is the added fact that the local company is controlled and managed by a holding company subject to the authority of a different state.

A new influence toward public ownership of power properties was introduced in 1933, when the Tennessee Valley Authority was set up as a government corporation. Its policy is to sell power to municipalities owning their own distribution systems and to take measures insuring efficient operation of those systems. Such projects were declared "yardsticks" of power costs. The government lent money at low rates also to many local authorities to build or purchase their own facilities for generation and distribution of power. See *Municipal Ownership*.

Habeas Corpus, Writ of. In English and in American law, a writ issued by a court of justice, commanding the person to whom the writ is directed to bring before the court the body of a person detained or in custody. Failure to appear with the person of a prisoner places an officer in "contempt of court" and makes him liable to the summary imposition, by the court, of fine or other punishment. The court, once the prisoner is brought into its presence, determines whether he is being legally held and may, after due examination, set him at liberty, release him upon bail, or recommit him to prison.

The writ of habeas corpus is an ancient one in English law, antedating Magna Charta. It had the constant support of Parliament against efforts of English kings to set it aside, and was strengthened by repeated legislative acts. It was brought to America by English colonists.

The Constitution of the United States (Article I, Section IX, Par. 2) provides that "the privilege of the writ of habeas corpus shall not be suspended unless, when in cases of rebellion or invasion, the public safety may require it." The weight of learned opinion holds that the suspension of the right must be accomplished by act of Congress; but President Lincoln, during the Civil War, by executive action suspended the privilege over extensive territory. His act was subsequently ratified by Congress. See *Habeas Corpus Act*.

The constitutions of all American states contain provisions safeguarding the privilege of habeas corpus, analogous to the provision of the Federal Constitution. A state court cannot issue a habeas corpus for the discharge of a person held in the custody of the Federal government. Four states—Mass., N. H., R. I., and S. C.—provide in their constitutions that the privilege of the writ may be suspended by the state legislature. (See *Martial Law*.) The writ of habeas corpus has been carried wherever the common law has been established.

Hague Peace Conferences. Two international conferences of modern states have been held that are known by the place of their assembly, the city of The Hague, which is the capital of the Netherlands. The first was proposed by Czar Nicholas II of Russia, and met in 1899 on the invitation of the czar and the queen of the Netherlands. In a circular note of August 12, 1898, issued by the Russian government, the objects of the conference were suggested to be "the maintenance of general peace and a possible reduction of excessive armaments." Twenty-seven states took part in this conference.

Results of First Conference. The deliberations of this conference resulted in three "conventions," three "declarations," and six "resolutions." The first convention was for "pacific settlement of international disputes." This provided for a permanent court of arbitration at The Hague, a permanent administrative council, made up of the diplomatic representatives of the signatory powers to The Hague, and an international bureau, acting under the direction of this council. The second convention dealt provisionally with the laws and customs of warfare on land. The third convention sought to adapt maritime warfare to the principles expressed in the Geneva Convention of August 24, 1864. The declarations sought to prohibit, for a period of five years, the use of projectiles or explosives discharged from balloons; the use of asphyxiating or poisonous gases; and the use of expanding or "dumdum" bullets in warfare.

The second conference was first proposed by President Roosevelt in 1904, but his proposal was withdrawn in order to allow the czar of Russia the privilege of calling the second conference as he had called the first. This met from June 15 to October 18, 1907. The following states, to the number of 44, were represented: Argentine Republic, Austria-

Hungary, Belgium, Bolivia, Brazil, Bulgaria, Chile, China, Colombia, Cuba, Denmark, Dominican Republic, Ecuador, France, Germany, Great Britain, Greece, Guatemala, Haiti, Iran, Italy, Japan, Luxembourg, Mexico, Montenegro, Netherlands, Nicaragua, Norway, Panama, Paraguay, Peru, Portugal, Rumania, Russia, El Salvador, Serbia, Siam, Spain, Sweden, Switzerland, Turkey, United States, Uruguay, Venezuela. It will be observed that, with the exception of two Central American states, Costa Rica and Honduras, the two African states of Ethiopia and Liberia, and the Central Asian monarchy of Afghanistan, the representation included practically all states then recognized as independent. Delegates from Korea, which by the Treaty of Portsmouth had recently passed under the control of Japan, failed to secure seats.

Acts of the Second Conference. This conference adopted a series of conventions, the first providing means for the peaceful settlement of international disputes and altering in certain respects the measures proposed by the first conference. The second limited the employment of force for the recovery of duties due from the citizens of one country to the citizens of another, and the third defined the procedure for the opening of hostilities in the event of war; and ten conventions which in a measure modified the laws of war on land and at sea. These conventions and declarations were only in part ratified by the participating nations, different countries excepting from the ratification of different measures.

Inasmuch as it was not contemplated that they would become effective between belligerents unless all belligerents were ratifying parties, the rules which sought to regularize the conditions of war and to mitigate its severities were completely disregarded in World War I. This was particularly noticeable in the case of the conventions forbidding bombardment of unfortified towns by naval forces, the laying of automatic submarine contact mines, the discharge of explosives from air vessels, the use of poisonous gases, and the respect for private property in warfare.

However, the war department of the United States, following this conference, revised its regulations governing the conduct of its armies in the field so as to include the provisions of the Hague Conference, thereby presumably making incumbent upon the officers and men of its own forces compliance with many of these principles. The extreme measures followed by all belligerents in World War I and the development of a public opinion that the severities of warfare cannot be softened without a prolongation of the struggle have probably rendered inapplicable the measures of the Hague Conference in this field.

Hague Tribunal. A standing court of arbitration created by the first Hague Peace Conference. Such a tribunal was proposed at the conference by the representative of the British government. The government of the United States had also specifically instructed its delegates to labor for such a court. In a convention signed at this conference, the nations agreed "to use their best efforts to ensure the pacific settlement of international differences" and, with this object in view, to undertake the organization of a "permanent court of arbitration." By the plan then devised, each signatory state nominated four jurists for a six-year period. These jurists constituted a panel, from which judges were to be selected to sit in arbitration.

The first case to be tried before this tribunal was one submitted by the United States and Mexico for the adjustment of a contention that followed the settlement of the Mexican war and was known as the "Pious Fund of the Californias." The award was made October 14, 1902, and was accepted by both governments. Three other awards were made by the Hague Tribunal, before the meeting of the second Hague Conference in 1907. This latter conference made some changes in the organization of the court and provided an alternative procedure called "arbitration by summary procedure."

Helsinki Accord. A non-binding agreement, formally known as the Conference on Security and Cooperation in Europe, and signed by 35 nations (all of the European nations, except Albania, plus the United States and Canada) on August 1, 1975. The pact has four major sections. The first section recognizes the permanence of post-war boundaries, calls for the notification of major military maneuvers to all participating nations, and asks for non-intervention in internal affairs, among other provisions. The second section requests economic, scientific, and environmental cooperation between participating nations. The third part, a human rights provision, asks the signature nations to "respect human rights and fundamental freedoms," including: the right to leave and enter countries on family visits, access to foreign publications, and improved conditions for journalists working abroad. The fourth section simply states the time and place of the next meeting.

Home Rule. Local self-government or the administration of home or local affairs in a part of a state by the people of that section. In British history, the phrase refers particularly to autonomous government for Ireland. In American politics, it is used mainly to express municipal autonomy, granted either by placing constitutional limitations upon state legislatures in favor of municipal governments or by a system of authorizing the citizens of a municipality to frame their own charter of government.

Immigration Legislation. Laws designed to exclude, limit, or select immigrants entering one country from a foreign country.

The power of a state to deny admission of a foreigner to its territory is an undoubted right under international law, and has been exercised in all times. Complete exclusion of foreigners and denial of free intercourse with foreign nations has, however, been treated as an act of unfriendly or hostile character, and against it nations have applied forceful methods. In this manner the foreign exclusion policy imposed upon China by the Manchu Dynasty was broken through by European nations, even at the cost of war; and in 1854 the United States, by a naval demonstration under Commodore Perry, coerced the government of Japan into abandoning its policy of nonintercourse with foreigners, which had been in force for nearly 250 years. In 1904 the British sent an armed mission into the "forbidden land" of Tibet and compelled the government at Lhasa to modify its exclusion policy.

These instances, however, in no way affect the political principle that a state possesses unlimited power, except as modified by treaty, to decide what classes of foreigners shall become immigrants and settlers. Serious diplomatic difficulties, however, may arise, as, for example, between the United States and Japan, when immigration legislation is not uniform with respect to all races and nations.

Immigration to America. The extraordinary migrations of peoples from Europe and Asia to the Americas, Australasia, and Africa during the last hundred years, not as colonists but as immigrants to countries already politically established, is one of the noticeable and far-reaching phenomena of the present economic age. The United States, as the country which has received these immigrants in greatest numbers, has experienced the greatest perplexity over the problems they create.

Immigration into the United States has passed through several phases. Previously to 1880 the immigration was almost exclusively from peoples of northern Europe, whence the original settlers of the United States had come. After that date, immigration from northern Europe declined, and that from southern Europe and from Russia rapidly increased. This so-called "new immigration" produced a change in the American attitude toward unlimited immigration. Until World War I, the immigration laws were designed only to exclude certain undesirable classes, including feeble-minded, insane, epileptics, sufferers from certain contagious or loathsome diseases, paupers, criminals, prostitutes, polygamists, anarchists, and those convicted of, or admitting, crimes or misdemeanors "involving moral turpitude." The importation of labor under contract was also forbidden.

Restriction of Asiatic Immigration. In addition, Asiatic immigration had been restricted, first, by the Chinese Exclusion act of 1882, re-enacted in 1892 and in 1902, whereby all immigration from China, except students, merchants, and a few other classes, was forbidden. In December 1943, the exclusion law was repealed, and Chinese were placed on the same footing as other immigrants. After 1900, when Japanese immigration into California became notable, an exclusion league was organized in that state and agitation was commenced to secure legislation forbidding the admission of Japanese. In 1907, when an immigration bill restricting the admission of Japanese and Korean laborers was introduced into Congress, the president secured in its place Congressional authority to suspend Japanese and Korean labor immigration coming from our insular possessions or from Canada or from Mexico. An agreement was made between the president of the United States and the government of Japan—the so-called "gentlemen's agreement"—whereby the latter government undertook to limit, by the refusal of passports, the entrance of laborers into the United States.

General Limitation of Immigration. In 1924 Congress passed an act which reduced annual immigration to 2% of the number of foreign residents living in the U.S. in 1890. The Immigration and Naturalization Act of 1952 (McCarran-Walter Act) removed race as a barrier to entry, but barred anyone who held "membership in or affiliation with subversive organizations." In 1965, the Immigration and Nationality Act provided for a total permissible immigration of 120,000 yearly from independent countries of the Western Hemisphere and 170,000 from all other countries, but not over 20,000 from any one country. Seven preference categories were set up: four to reunite relatives of U.S. citizens, two to encourage skilled and professional workers, and one for political refugees. In 1975, some 131,000 Vietnamese refugees were admitted to the U.S. under this last category.

Impeachment. A form of criminal procedure, involving charges and trial, by a legislative body against those in high office. Impeachment differs from attainder in being a judicial, not a legislative, measure. It originated in England through the bringing of charges by the House of Commons against oppressive acts of officials of the crown. The House of Lords, as the highest judicial body of England, judged the complaints pressed by the Commons. The right of the Commons to impeach whomsoever it will, has been recognized, though the practice has fallen into disuse in Great Britain for more than a century, the system of responsibility of ministers to the House of Commons having made impeachment unnecessary.

The earliest instances are the impeachment of Lord Latimer in 1376 and of Pole, earl of Suffolk, in 1386. The last British impeachments were those of Warren Hastings, 1788–1795, and Lord Melville, 1806.

The institution of impeachment was adopted by the framers of the United States Constitution, which provides that the president, the vice president, and all civil officers of the U.S. shall be removed from office "on impeachment for and conviction of treason, bribery, and other high crimes and misdemeanors." The penalty upon conviction, however, is confined to removal from office and to disqualification to hold any office of honor, profit, or trust under the U.S.

Impeachment charges are brought by the House of Representatives and are tried by the Senate. If the president of the U.S. is impeached, the chief justice of the U.S. Supreme Court presides at the trial; otherwise, the vice president presides. A two-thirds vote of the Senate is necessary for conviction. There have been nine cases of impeachment of federal officials and three convictions. The most famous impeachment trial was that of President Johnson in 1868, who failed conviction by one vote.

Members of Congress are not subject to impeachment, but they may be expelled from either chamber by a two-thirds vote of its members. Impeachment of state officials is provided for in most state constitutions, the procedure being modeled upon the federal system. In 1913 a governor of New York was impeached and was convicted on the charge of misappropriating campaign funds. In this case, the crime was committed before election to office.

Inauguration Day. The day when a chief executive of a nation, state, or city assumes office.

The Continental Congress, upon the ratification of the Constitution of the United States in 1788, provided that states should choose presidential electors on the first Wednesday in January 1789; that these should choose the first president and the first vice president on the first Wednesday in February; and that the new Congress should assemble in New York on the first Wednesday in March. The first Wednesday in March was the 4th, and, although President Washington was not inaugurated until April 30, the date March 4th, following a presidential election, continued to be inauguration day until changed in 1933 by the 20th Amendment to January 20th.

Industrial Court. See *Arbitration of Industrial Disputes.*

Initiative of Laws. A procedure whereby proposals of law may originate in the petition of private citizens. This measure is frequently associated with another procedure, the referendum of laws, but, as stated elsewhere, it differs from the referendum in being a radical device.

Before the adoption of the popular initiative, projects of law came from two recognized sources: (1) In countries having parliamentary or cabinet governments, they usually are initiated by ministers; and in the United States, where presidential government exists, they may originate in "executive measures" recommended to the attention of Congress by the president or to state legislatures by governors. (2) Measures arise in the legislatures themselves, either by the action of single members or by the work of committees or commissions. Under the operation of the popular initiative, a project of law may be originated by anyone, and, a sufficient number of petitioners in behalf of the measure having been obtained, the proposal goes either to the legislature under an obligation to pass upon it, or to the popular judgment as expressed in a general election. The second practice is the one common in the U.S.

Among the objections to the popular initiative are the following: It affords opportunity for the proposal of eccentric legislation. It frequently encumbers the electoral ballot with an undue number of complicated and doubtful measures that confuse and embarrass the electoral mind. Where there is indifference or inertia of the voters, it may lead to the enactment of laws by minorities of the voting population. As a procedure, it affords no opportunity for the improvement of a bill by discussion preceding enactment, a most important parliamentary step in the proper shaping of legislation. In American states, where the practice exists of recognizing the popular enactment as superior to the legislative will, it imposes additional impediments upon legislatures and tends to bring into doubt and confusion the constitutional laws of the state.

The popular initiative was adopted by the American people from the example of Switzerland and exists by constitutional provision in 21 American states. See *Referendum and Initiative of Laws.*

Injunction, Writ of. The name for a judicial process under English law, whereby a party is "enjoined" or commanded by the court to refrain from doing some particular thing described in the writ. While injunction is properly a restraining order, it may be used to prevent persons from interrupting the normal continuance of things, as the flow of water or the movement of trains.

In the United States, the writ is issued both by federal and by state courts. It has been issued at the instance of the president, to prevent organized obstruction of interstate commerce and, particularly, of the movement and delivery of mail. It has been used to prevent labor unions and other organizations, when on strike, from interfering with the property and interests of employers. Leaders of such organizations, disobeying the writ, have been arrested by order of the court. Laws attacked as unconstitutional have frequently been enjoined from enforcement by lower courts so as to be nullified in their effect until ruled on by the Supreme Court.

Criticism against the use of writs of injunction has resulted in two types of restrictions in their use by federal courts. In 1932, an act was passed by Congress forbidding issuance of injunctions in labor disputes except under carefully defined conditions, such as actual evidence of prospective damage. In 1937, Congress forbade injunctions against the government on the ground of a law's unconstitutionality unless issued by a three-judge court, one member being a justice of the circuit court of appeals.

International Labor Organization. A specialized agency of the United Nations since 1946, the International Labor Organization was established in 1919 as part of the Treaty of Versailles. The agency was designed to encourage social justice, to improve labor and living standards, to promote the adoption of labor legislation, and to support economic and social stability. The ILO won the 1969 Nobel Peace Prize for its pre-World War II activities to further world peace and for its involvement in population and unemployment problems.

Delegates from each member nation number four, all appointed by the government. Two represent the government, one represents employers, and one speaks for organized labor. Member nations of the League of Nations automatically became members of the body; other nations may join. Delegates convene yearly for decisions on agenda prepared by the International Labor Office, a committee of 32 delegates of the organization. Recommendations, requiring a two-thirds vote for adoption, take the form chiefly of draft conventions. Delegates of member nations are required to bring the proposed conventions, or treaties, before bodies of their own countries competent to conclude treaties. If ratified, the treaties become binding between the ratifying nations. Limitation of work hours and measures for the protection of women and children from exploitation have been among the conventions ratified.

The United States, by action of Congress in 1935, became affiliated as the 62d member. Relations between the ILO and U.S. weakened as the ILO became more political, more anti-West. In 1975 the U.S. issued a required two-year notice of intent to withdraw. Two years later, after much debating within the country, the U.S. formally withdrew from the ILO—the first U.S. resignation from a UN agency

Interstate Commerce. The Constitution of the United States empowers the federal government to regulate commerce "with foreign nations and among the several states." It also forbids states to impose specified burdens on the commerce of other states. These provisions, as interpreted by the Supreme Court, are the foundation of Congressional power to rule economic activities in the U.S.

The Court has interpreted commerce to include interstate transportation and communication. It has also extended the definition of commerce to mean all that directly affects commerce between states, thereby enlarging federal authority to cover many intra-state rail road rates, business practices, and price fixing that impede the interstate shipment of goods.

For many years Congress was unable to regulate manufacture and production generally, these processes being held to be wholly intra-state. By the *Jones* and *Laughlin* decision on April 11, 1937, however, the Supreme Court ruled that practices which threatened to interrupt production destined for interstate commerce were subject to federal control.

Intervention. The interference by one state in the affairs of another sovereign state by force or by the threat of force. Even when hostilities are avoided, intervention can with difficulty be distinguished from an act of war, since it is the coercion by one nation of the will of another by acts of violence or by menace of violence. Except where a right of intervention has been conceded by one state to another during the existence of certain crises, as is the case with certain Latin-American countries and the United

States, it is difficult to find "legal" justification for the numerous acts of intervention with which the history of states is filled. Justification must be based upon political or moral grounds, among which the most important are: to ward off imminent danger to the intervening state or to its citizens; to end a condition of violence, anarchy, or oppression, repellent to the instincts of humanity; to preserve a balance of power and to prevent the aggrandizement of the influence of a rival state. This last ground of intervention in the past has been the frequent occasion of European wars.

Modern instances of intervention, on one or another of the above grounds, are the allied intervention in China, 1900, to rescue, from the Boxers, legations and nationals under siege; the intervention of the United States to end Spanish rule and warfare in Cuba in 1898; American intervention in Cuba in 1906 in compliance with the terms of the Platt amendment (See *Cuba*); and further American interventions in Santo Domingo, Haiti, Nicaragua, Panama, and Mexico.

Intervention in the past has been so frequently employed upon trivial and unjustifiable pretexts that a doctrine of "nonintervention" has developed, particularly associated with the name of the English Liberal, Richard Cobden, 1804–1865. Cobden's political platform was "free trade and no intervention." Noninterventionists hold that the sanctity of a state is so great and the right of a people to settle their internal affairs so sacred that intervention can never be justified on any grounds whatever, and that for one state to employ force against another to end revolution, misrule, or violations of the rights of its own nationals, is without possible moral justification.

Such extreme views are at the basis of the "anti-imperialistic" movement in the United States, which found political expression in the platform of the Democratic party in 1900, when imperialism was declared to be the "paramount issue." The Platt amendment was abrogated in 1934. The purpose in part was to establish confidence, throughout the New World, in the pacific intentions of the United States and so to pave the way toward international agreements for the restriction of warfare.

It is difficult at times to distinguish intervention from an undeclared war. The operations which led to Japan's taking of Manchuria from China in 1931 and Italy's conquest of Ethiopia in 1935-36 began as drastic forms of intervention. In neither case was there a declaration of war.

Lobbying. The practice of importuning legislators for the passage or defeat of pending legislation. Many large well-organized groups of the population which hope to obtain benefits, or fear disadvantages, from legislation maintain "contact men" or "legislative departments" for the purpose of influencing legislation.

Among the methods used are:

1. Cultivating members of Congress or state legislatures.

2. Observing and reporting to voters the action of individual legislators on the object sought by the lobby, the purpose being to add to, or detract from, the legislator's popular support. Legislators may or may not be questioned on their attitude in this process.

3. Creating an impression in the minds of the legislators that there is a large popular demand for the measures advocated. This may take the form of having large numbers of letters and telegrams sent to legislators, urging enactment of the measures. In other cases, "marches" on the Capitol are organized.

The practice has been abused and has frequently been made the means of bribery and of corruption. To protect themselves, legislatures have enacted antilobby measures, such as prohibiting the presence of lobbyists on the floor of legislative halls, or in their anterooms. The Public Utility act of 1935 requires that all persons seeking to influence legislation on public utilities must register and report monthly on the interests for whom they are acting, the amount of money received for the purpose, and the manner in which it was spent.

Properly controlled, the practice of lobbying may be legitimate and may even prove an assistance to a legislature struggling with a mass of proposed legislation. The preferred procedure for advocates or opponents of bills is to appear before committees of the legislature and in open session to state their case and disclose the groups for whom they are speaking.

The term is derived from the word lobby, meaning a cloakroom or antechamber, wherein the so-called lobbyist is supposed to exert important influence upon the members of the legislature.

Logrolling. A system of bargaining among members of a legislative body, whereby one member, by giving his support to other members' measures, obtains the support of others for a measure in which he or his constituency is interested. Logrolling has been carried to its highest point in American legislatures, facilitated, as it is, by the practice of allowing members to introduce bills without limit. Logrolling is connected especially with "pork barrel" legislation, or with bills appropriating moneys for local improvements and for interests without reference to state or national policy. See *Pork Barrel*.

Majority. A number greater than half of a total number. In deliberative bodies or elections, a number greater than half the votes cast, or, in another sense, the excess of that greater number over the remainder of the total. The term "majority" is sometimes loosely used to designate the number of votes received by a candidate, or by one of several candidates, in excess of the vote of his nearest competitor; but this relation is properly termed a "plurality."

An "absolute majority" means, in common usage, the number greater than half of all voting, or of all present whether or not voting, or of those entitled to vote.

Majority Leader. The leader of the majority party in a legislative body as in the U. S. Senate or in the House of Representatives.

Marine Corps. Marines, or, as they are sometimes popularly called, "soldiers of the sea," are a military organization serving under the navy department. In the United States, they constitute a distinct corps under the secretary of the navy. Originally they were introduced into the British navy to enforce discipline over the sailors. Their employment, however, has been continued for other reasons. Marines are favored in the United States navy because of their extreme serviceability for guard duty and ceremonies aboard ships, for the defense of naval property ashore, and as landing parties from war vessels for the protection of life and property in foreign countries in times of disturbance.

They have been used especially by the United States government in foreign intervention. Forming a part of the navy and transported aboard warships, they exceed all other land forces in mobility, while their frequent employment for police or protective duty makes their use on foreign soil less likely to be misconstrued as an act of war than would the landing of elements of a regular army.

Martial (*mär'shăl*) **Law.** Martial law must be distinguished from "military law" and "military government." While the statement is often made that "martial law has been declared" in some city or district in the United States, this does not mean the substitution of military for civil authority, which, under the American system of constitutional guarantees, cannot take place except during an actual state of war. The phrase does not correspond to what is elsewhere called "suspending constitutional guarantees" or "declaring a state of siege." In these latter cases, civil government is actually suspended, and civil authority gives place to military.

In the United States the activity of troops, either state or national, in time of civil disturbance, means no more than that the military forces have been called into action to uphold the authority of the president or of the governor of the state and to enforce his orders. Government remains civil, but acts through military organization because the ordinary administration is unable to cope with the situation. The employment of troops is not to wage war but to keep peace. In preserving life and property, troops may resist violence, even to the point of taking life, but their responsibility in such cases is not different from that of civil officers. Arrests may be made, but as measures of precaution, not for the infliction of punishment by military courts.

Undoubtedly, a state of domestic insurrection may be so serious as to justify strong measures by troops, but the authority for their employment remains with the civil head. Civil courts are not superseded nor is civil law abrogated unless action to suspend the guarantees of civil liberty is taken by Congress, or by the legislature of a state, as is permitted in a few state constitutions.

Mayor. The chief executive of a British or an American city, corresponding to the French "maire" or the German "burgomaster." See *France* and *Germany*.

In addition to administrative powers, the mayor in certain countries possesses the authority of a local magistrate; and in continental states generally he has a legislative or "ordinance" power. Outside of British and American states, he is almost invariably an agent of the national government as well as the head of municipal administration.

In Great Britain, the mayor is the presiding officer of the city council and possesses no greater legislative authority than any member. He is the official representative of the municipality and as such occupies a position of high honorary and social distinction. In the United States, under the older and more customary form of municipal government, the mayor has a veto over the legislation of the council and may have extraordinary power in budget matters. See *City Government*.

Merit System. The appointment of persons to positions in the civil service of the city, state, or nation for reasons of fitness shown in competitive examinations, rather than as a means of payment for political services to the party in power.

Military Government. Government, in either domestic or foreign territory, under army or navy commanders.

Under the constitutional system of the United States, military government is set up by order of the president as commander in chief of the army and navy of the United States. The president may prescribe such administration for domestic territory in rebellion, for foreign territory occupied in time of war by the forces of the United States, or for territory recently acquired by conquest or treaty. The president may also set up military government within or over foreign territory in which the United States has intervened, with army or navy force.

Subject to the president's authority, such government may employ the widest types of administration, may pass laws, and may create courts. While normally resorted to in time of war or during hostilities, such government may continue after peace has been secured and is legal until altered by act of Congress.

Over territory outside of the Union, such government is not limited by the prohibitions of the Constitution. Trial by jury need not be established. In such a case, to use a popular expression, "the Constitution does not follow the flag."

Military Law. Military law must be distinguished from martial law. As this term is used in England and in America, it means those laws and regulations which apply to soldiers and sailors, assure the discipline of armies and fleets, and are enforced not by civil courts, but by military tribunals, or "courts-martial."

In the United States, on the outbreak of the Revolutionary War, the Continental Congress issued a series of rules modeled upon English regulations, which were reissued September 30, 1776, and have been frequently revised. This code is known as the "Articles of War." They prescribe a series of offenses and infractions of discipline to which military officers and men are subject and which may be visited by various penalties, including death for certain offenses in time of war. A person becomes subject to military law upon accepting an appointment or commission or upon enlisting in, or being called or drafted into, the army or navy. He is ordinarily free from this jurisdiction upon discharge or upon the termination of his commission or appointment.

Liability to military law in no way lessens the liability of a soldier or sailor to the civil and the criminal law of the nation or state. It simply subjects him to a double jurisdiction, one as a citizen, the other as a soldier or sailor. Being thus subject, he may be tried twice and punished twice, that is, by both civil and military authority, without constitutionally being placed twice in jeopardy for the same offense.

Military law is usually enforced through military courts or "courts-martial." These consist of boards of officers, convened, by order of the president or a military commander, for the trial of such cases as may be submitted to them. The sentences of these courts have no effect until they are approved by the authority convening the court, or by the president of the United States.

A "summary court" consists of a single officer for the trial of minor infractions of soldierly behavior, punishment being limited to penalties not greater than one month's confinement or detention, loss of two-thirds of one month's pay, or both.

A "general court-martial" consists of a board of officers, not less than five in number, of rank appropriate to the rank of the accused, if an officer. It possesses jurisdiction over every offense triable under the Articles of War, and has power to impose a sentence of dishonorable dismissal, or of death.

Minority Leader. The head of the minority party in a legislative body as in the U. S. Senate or in the House of Representatives.

Modus Vivendi (*mō'dŭs vĭ-vĕn'dī*). A temporary arrangement between the governments of two countries, pending the settlement of relations by a formal treaty.

Monarchy. That form of government in which, actually or theoretically, political authority is vested in a single ruler who represents the sovereign power of the state.

Monarchy is intimately connected with the principles of "divine right" and those of "legitimacy," the latter theory maintaining that royal power can be derived only by legitimate succession from a previous ruler through blood or recognized connection. In the legitimist conception, there is at a given time only one person in the world lawfully entitled to any given throne, and the right of this person cannot be affected or taken away by Parliament, popular will, or revolution.

Legitimate monarchy is to be distinguished from the "imperialist" conception, in which a Cæsar or a Napoleon rises to a position of monarchical authority by military triumphs and by the devotion of the people or of the army. In this institution, the right to rule is derived from the unprecedented services of an individual to the nation, rather than from legitimate succession or through the claim of divine ordination.

There may further be distinguished the seizure of supreme power by a civil or a military leader and its maintenance by the ruthless suppression of opponents. Such were the "tyrants" of the Greek city-states, the "despots" of Italian cities, and the "dictators" of Spanish America.

Limitation of Monarchy. While, in theory, monarchy is an absolute power of government, practically all monarchies tend to become, or have become, limited or constitutional. In the first place, monarchies are usually limited by the presence of a nobility who may contend with the king, as the English nobles did with King John at Runnymede. Corporations arise, such as the medieval towns, which secure concessions of rights, subsequently to be tenaciously defended against royal prerogative. The religious power or organization enters, usually supporting the pretensions of the monarchy, but frequently opposing it in defense of its own sacred position.

In Europe, monarchy attained its highest pretensions in the 18th century, when the "benevolent despots" of France, Spain, Austria, Prussia, and Russia claimed and nearly succeeded in exercising unlimited power. In England, these same claims had been defeated in the 17th century by the English revolution and by the strength of the British aristocracy. These circumstances gave rise to British constitutional monarchy. The French Revolution largely destroyed popular support of unlimited monarchy and brought into force the conception of government resting upon popular will. Throughout the 19th century, however, monarchy played a leading part in European governments. It rose again in esteem, partly through the success of the British system of parliamentary government and the exercise of all crown powers by ministers responsible to a representative body, and partly through the achievements of monarchical government in unifying Italy and Germany. After 1871, for an entire generation, republican government in Europe appeared to make little progress except in France and in Switzerland.

World War I swept away many monarchical governments, and republicanism appeared dominant; but economic and political unrest produced in many countries dictatorships hardly to be distinguished from monarchy in fact. In 1977, the monarchical governments of Europe were Great Britain, Belgium, Norway, Sweden, Denmark, the Netherlands, Luxembourg, Monaco, Liechtenstein, and Spain.

Monopoly. This is the right, or the power, so to dominate the market for a commodity that a higher price may be exacted than would prevail under free competition.

Since the monopolies granted by kings under royal charters, the leading forms have been: patent rights; local franchises for public utility companies; and more or less informal combinations of producers. The first two forms are provided for by law as being in the public interest. The third is a defense that has arisen more or less spontaneously against destructive competition. Opinion differs regarding its advantages to the public.

Trust. This term is used popularly to describe industrial combinations, whether they operate through private agreements, mergers, acquisition of competing concerns by a holding company, influence over policy by investment banks, interlocking directorates, or numerous other devices. Their power lies partly in their ability to supply a large proportion of the market and to make it difficult for new producers to obtain credit or materials so as to enter the market. The advantage to their sponsors lies in the ability to prevent demoralization of prices through competition, production normally being cut when demand falls off. Their danger from the consumers' viewpoint is that they have the power to increase prices above a reasonable level. A more recent criticism is that, by holding up some prices when others, lacking such support, are being readjusted to lower levels in a depression, they choke off demand in certain fields and so prevent a speedy return of the idle to employment.

From a social viewpoint, benefits of "trusts," or concentration of control in industry, include low cost production through large buying power, and economies in selling, financing, standardization, and management. Dangers include lack of flexibility, possibilities of withholding from buyers the benefits of economies brought about, and the concentration of power in hands not responsive to considerations of public interest.

Anti-trust Laws. The Sherman act of 1890, the first of these statutes in the United States, prohibited all combinations in restraint of interstate and foreign trade. The Supreme Court interpreted this law to prohibit "unreasonable" restraint of trade and made the illegality of a combination depend on the proportion of the industry it represented.

The Clayton act of 1914 legalized certain activities of trade associations outlawed under the earlier act and

forbade acquisition of the shares of one company by another if a tendency toward monopoly resulted. Acquisition of assets, however, was not forbidden. A federal trade commission was established in the same year to investigate and prosecute unfair competition.

These laws did not prevent concentration of industrial control from marching steadily on. The government temporarily changed its attitude in 1933 and permitted combinations in the form of "codes" under the National Recovery Act, industries being required in return to increase wage rates and abstain from opposing the organization of employees. After the Supreme Court declared this act unconstitutional, administrative policy returned to a stricter enforcement of antitrust laws.

Monroe Doctrine. An important declaration of policy made by President Monroe in a message to Congress, December 2, 1823, in which the president declared "that the American continents, by the free and independent condition which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European powers." The message called attention to what the president considered to be the difference between the political system of the monarchies of Europe and that of America, and stated that any attempt on the part of these European monarchies to extend their system to any portion of the Western Hemisphere would be regarded as dangerous to the peace and safety of the United States.

The doctrine, at the time, accomplished its purpose of warning the Holy Alliance, composed of European powers, from intervening to overthrow the independence of the newly arisen Spanish American republics, and it has since been repeatedly appealed to by successive presidents, though not until 1896 was it formally noticed by Congress. Following the "Venezuela incident" of that year, in which the American government interfered to stop what it regarded as encroachments of the British government upon territorial rights of Venezuela, the policy was overwhelmingly endorsed by the American nation and by both the great political parties.

The Monroe Doctrine is not, as is sometimes supposed, a principle of international law. It is in fact directly opposed to a fundamental principle of international law; namely, that a state may dispose of its own territory to another state without hindrance, for the Monroe Doctrine would probably be invoked to prevent the cession of an American possession by a weak state to a stronger one. The Monroe Doctrine is simply an American policy, never directly admitted by European nations until it found mention, though not a satisfactory mention, in the Covenant of the League of Nations. As a policy, it accorded with a deep, though undefined, American resolution to liquidate the possessions of European states in the New World and to prevent the political issues of the Western continents from being determined at the capitals of Europe.

Under some presidents, this policy has approximated the claim of a protectorate over Latin-American countries and as such was deeply resented. Under Franklin D. Roosevelt's administration a new turn was given to it. In multilateral trade treaties negotiated in 1936-37 at Buenos Aires, he sought to make the Doctrine a policy of all American states, pledged to oppose aggression from outside and to minimize conflicts among themselves by prompt consultation when threats to peace arose.

Mugwump. A celebrated political cartoon picturing the independent voter as having his mug on one side of the fence and his wump on the other.

Municipal Ownership. The civic possession of certain properties, as streets, bridges, ferries, parks, and sewage systems, is well-nigh indispensable to urban life. Only in rare instances, and then to the prejudice of city life, are such necessities as these privately owned. In most cities, water supply is now municipally owned. Other public utilities, such as street railways and lighting systems, are either privately or municipally owned. In Europe, they are generally the property of the city and are operated by its employees. In the United States, more frequently, they are privately owned, but are controlled, with respect to service and rates, by their franchises, by ordinances of the city government, or by state public utility commissions.

The question of private ownership and operation of public utilities in cities has been one of the most important and the most perplexing problems of American government. A franchise for such a utility carries with it the creation of a virtual monopoly privilege and the right of eminent domain; it also presents, if unrestrained, the opportunity for maintaining extortionate rates for service. As such, it is a privilege that has been eagerly sought, bitterly contested for, and frequently corruptly acquired. See *Government Ownership*.

In the United States, municipal governments do not generally engage in several kinds of services, such as public pawnshops, municipal orchestras, opera houses, etc., which are common in Europe.. In America, great attention has been given to parks and to public playgrounds. The scope of municipally owned activities can hardly be settled by any theoretical principles. In each country and in each community, it is a matter for practical decision.

National Convention. Since 1832, in the United States, candidates for president and vice president have been nominated at national conventions especially convened for that purpose once in four years.

The national convention is not the creature of the law. It is an extra-legal party meeting, and its membership, machinery, and procedure are determined by party rules.

The rules of the Democratic and Republican parties provide for the selection of two delegates from each congressional district, and for four delegates at large from each state. An amendment to the rules of the Republican party, which was passed in 1916, limits full representation in the national convention to those congressional districts having a Republican enrollment of at least 7500 voters. To the Republican party convention, delegates are chosen in the same manner as that in which congressmen are nominated in the several districts. The Democratic party leaves the method of selecting delegates to the party organization of each state.

Convention Procedure. The chairman of the national committee, who has been chosen at the preceding national convention, initiates the proceedings of the convention. He is succeeded by a temporary chairman chosen by the convention. The convention committees, the most important being the committee on credentials and the committee on rules, are then chosen, the delegation from each state choosing one member for each committee.

The report of the committee on credentials, affecting contested seats, is then presented to the convention as a whole, which either approves and adopts the report in its entirety, or votes upon each contested seat separately. In the Republican convention, under the ruling of Senator Root, in 1912, every person entered upon the temporary roll of the convention by the national committee, even though his own right to sit in the convention is contested, is eligible to vote with respect to the seating of any other contested delegate. See *Convention, Political*.

National Defense. This term is used to describe the established provisions of a state for protecting its rights and territory, particularly from foreign invasion or aggression. Some such provision has ever been regarded as indispensable for national existence and security. The preamble to the Constitution of the United States declares that one object of the Union is to "provide for the common defense."

The type of defense establishment varies greatly with different states, generally according to their size, their frontiers, their geographical security, their traditional friendships and enmities, and the aims of their foreign policies. The main reliance may be naval, as in the case of Great Britain, or, at an earlier date, of Holland; or it may be land forces. In the main, four types of armies have been relied upon by states for the attainment of their military policies: (1) professional armies; (2) mercenary troops; (3) "militia," or organizations of citizens trained in time of peace, and volunteer forces raised in case of emergency; (4) forces prepared by universal or general military training.

Professional Armies. The first, that of a professional army recruited voluntarily, was the general reliance of European states down to the French Revolution. Great Britain, throughout her history, has relied almost entirely upon professional armies, except where she has employed mercenary troops or has subsidized foreign troops in common wars. In World War I, an army conscription bill was not enacted by the British Parliament until 1916. A professional army may be brought to the highest state of proficiency, and, for a country possessing overseas responsibilities which have to be guarded, it is a well-nigh indispensable element in the national plan of defense.

Mercenary Armies. Mercenary armies have been employed in all times, and their use has frequently been notorious, as in the case of the mercenary bands that infested Italy in the 16th century, or in the employment of German troops by Great Britain against the American colonists in the Revolutionary War. Their use has been unsparingly condemned by practically every serious student of the art of politics or of war.

Volunteer Forces. The third, the method of volunteer forces raised in time of emergency, has been the traditional policy of the United States. Reliance upon hastily raised troops, while a congenial policy to a people little troubled by threat of war, has proved again and again in American history to be ineffective from a military standpoint, and frightfully wasteful of life and treasure. The highly technical character of modern warfare, the variety of war matériel, the extreme expenditure of munitions, and especially the need of trained officers to take command of levies of troops, have rendered obsolete and indefensible a reliance upon extemporized volunteer forces.

Universal Training. Some system of general training of all young men for military duties appears at once the most satisfactory, as it is the most just and the most democratic, of all plans of defense. It recognizes the duty of

protection of nation and civilization as a common duty, from which no man of suitable age or physique may properly be exempted. It imposes the hardships and sacrifices of warfare upon all classes of society alike, and puts at the disposal of a nation its full resource of man power without the demoralizing effects of discrimination and bounties. That such a policy is now endorsed by the American people is evidenced by the draft legislation of Congress of 1917 and by the National Defense act of 1916 and of 1920.

This latter legislation gives the country a policy of national defense and a prospective complement of forces adequate for any probable emergency. Under this act, the army of the United States is formed of three components: (1) the "regular army," a small standing body of professional soldiers whose duties are to man the coast defenses, garrison overseas possessions, care for the stores, ordnance, fortifications, camps, and other military property, supply a limited mobile body of troops as a first element for defense and, through its officer and noncommissioned officer personnel, furnish instruction to the national guard, organized reserves, reserve officers' training corps in colleges and schools, and citizens' training camps. (2) The second component is the "national guard," organized in such a manner that each state is charged with the responsibility of maintaining, in times of peace, certain units of citizen soldiers, which may be combined into a number of army divisions and corps. (3) Third, the "organized reserves," comprising officers and men of training, so developed as to form the "cadres" or skeleton structures of additional divisions, which, within a few months' time after a declaration of war, could be raised to full strength, armed, equipped, and trained for the field.

The National Guard. The national guard, with the regular army, constitutes the first line of defense and is to be so officered, equipped, and trained as to approximate, in its organization and performance of duty, the standards of the regular army. The national guard in each state is, moreover, under the orders of the governor of the state, and constitutes a constantly ready force at his command for the execution of the law and for the maintenance of public order. It may, by order of the president of the United States, be called into the Federal service to repel invasion, to suppress insurrection, or to enforce the laws of the Union.

Naturalization. A term given in law to the acquisition of citizenship in a country other than that in which one has been a citizen or a subject.

The act is necessarily voluntary on the part of the person acquiring naturalization, and must have the consent of the state in which citizenship is acquired. The consent of the state whose citizenship is renounced is not necessary to the act, and may even be refused. The act of severing citizenship is called "expatriation." It is a renunciation, by formal action, of the rights and obligations of citizenship therein. If the act of renunciation is not recognized by the state in which citizenship was formerly held, it may happen that two states may claim the same citizen or subject. See *Citizenship*.

American Naturalization. The United States has given great attention to naturalization of foreigners who seek permanent residence in this country. Prior to 1942, the procedure consisted of two steps—a declaration of intention to become a citizen filed two or more years after arrival and a petition for naturalization filed at least three years later. Moreover, citizenship was available only to members of the white and Negro races.

The law was extensively revised in 1942 to simplify procedure and for other purposes. All racial bars were removed. The same rules apply to men as to women. The essential requirements now are as follows:

1. The applicant must be at least 18 years of age and have had legal residence in the United States for at least five years. The residence period is reduced to three years for the wife or husband of a citizen.

2. He must apply to a federal court, signing the application in his own handwriting and (with certain exceptions for older people) be able to read, write, and speak words in ordinary use in the English language.

3. He must attest by two credible citizen witnesses that he has been, for the qualifying period, a person of good moral character, attached to the principles of the constitution, and well disposed to the good order and happiness of the United States. Naturalization is denied to anyone who, in the prior ten years, was a member of a subversive organization unless he was under 16 at the time or became a member under duress. Those excluded because of lack of good moral character include habitual drunkards, adulterers, polygamists, gamblers, violators of criminal law, those convicted of murder, those who have spent 180 days or more in prison, and those who gave false testimony to obtain a benefit under the immigration law.

4. He must demonstrate to the court's satisfaction a knowledge and understanding of the fundamentals of the history of the United States and of its principles and form of government.

When these tests are met, the applicant waits 30 days and then takes the oath of allegiance to the United States before the court and receives his "certificate of citizenship."

The oath of allegiance is as follows:

"I hereby declare, on oath, that I absolutely and entirely renounce and abjure all allegiance and fidelity to any foreign prince, potentate, state or sovereignty, of whom or which I have heretofore been a subject or citizen; that I will support and defend the Constitution and laws of the United States of America against all enemies, foreign and domestic; that I will bear arms on behalf of the United States when required by the law; that I will perform noncombatant service in the armed forces of the United States when required by the law; that I will perform work of national importance under civilian direction when required by the law, and that I take this obligation freely without any mental reservation or purpose of evasion; so help me God."

In many states the public school system now offers special instruction for aliens desiring to prepare for the citizenship examination, and the practice of making the oath of citizenship a formal ceremony is becoming common.

Neutrality. The status of a nation taking no belligerent part in a conflict between other nations, but preserving friendly relations with both or all.

By international law, citizens of a neutral nation may trade freely with a belligerent, even to the extent of furnishing arms and munitions. Such goods, however, may be seized as "contraband of war," and neutral merchant vessels are subject to "visit and search" by war vessels of the belligerent states to determine the presence of contraband in their cargoes.

A nation, to remain neutral, must be strictly impartial in the assistance which it or its citizens afford. It may not permit its territory to be used as a refuge for troops of belligerent nations, nor as a means of transit for them, nor for the recruiting of troops. Its ports may be used by the war vessels of belligerents only for a limited number of days, and that use is restricted to the making of repairs or to the securing of supplies indispensable to the continued voyage of the belligerent vessel. Similar obligations bind the neutral state with respect to the use of its territory for purposes of communication by telegraph, by cable, or by radio, and, while private citizens may freely sell their wares to a belligerent state, a nation may not dispose of its naval vessels or of war matériel to a belligerent during the actual period of the war, without violating neutrality.

A legislative attempt was made in 1935 to safeguard American neutrality in foreign wars by directing the president to forbid sales of arms or loans to warring nations and warning American citizens against trade and travel. In 1939 the law was changed to allow the sale of arms, to be paid for and transported by the purchaser ("cash and carry"). American citizens were forbidden to travel in belligerent countries or on their ships, or to extend credits to such countries. American ships also were forbidden to enter combat areas.

The neutrality of some states has been guaranteed by treaty. Examples are Belgium before World War I and Austria after World War II.

Nihilism (*nī'hĭ-lĭz'm*). A term given to Russian radicals who refused to recognize the validity of existing institutions, social, political, or religious. The word was first used in this sense by the novelist Turgéniev in his *Fathers and Sons*, published in 1862.

The movement, which at first centered in student communities, was highly rationalistic and materialistic. It regarded religion, family life, private property, and even public administration as obstacles to the free development of the individual and of rational society. The movement had philosophical points of contact with anarchism. The repressive action of the Russian bureaucracy led to acts of retaliation and terrorism by the Nihilists, the most sensational being the assassination of the czar Alexander II in 1881.

The word is frequently applied in the United States to all "terrorists," or to those who use the assassination of officials to intimidate the government.

Oligarchy (*ŏl'ĭ-gär'kĭ*). A government in which the power of the state is held by a few, as opposed to the many. It is distinguished from an aristocracy only as being a corrupt form. Of all forms of government—democratic, aristocratic, or monarchic—an oligarchy has generally been condemned as the worst, its members invariably being led to exercise their power in their own interest, unrestrained by such consideration as is felt by a king for his people, or by the traditional sentiments of honor and public responsibility that may characterize an aristocracy under the phrase, "noblesse oblige." Oligarchies have frequently been associated with the seizure of governments by violence, chicanery, fraud, or by monetary power.

Ombudsman. The title of a Swedish officer whose duty it is to hear complaints of citizens against the government. He may explain that the complaints are baseless or, if they are well founded, may use his authority to have responsible officials correct the situations complained of. The office was established in Sweden in 1809. Some other jurisdictions have copied it.

Open Door Policy. The preservation of opportunity for foreign trade in a country, on a basis of fair and equal competition for all nations. Open door policy means also that, in the development of economically backward countries, all foreign nations shall have an equal opportunity to offer the services of their credit and their technical experts, and to obtain concessions for transportation construction or for mineral development upon equal terms.

The term "open door" seems to have been first used by Admiral Lord Charles Beresford in 1899. Secretary Hay adopted it in 1900 in stating the policy of the United States toward China in opposing the aggression of other nations, particularly Japan.

Open Town or **Open City.** A term applied to a city or town which has been formally declared undefended and open to the enemy. The approach to the town must be open, all troops withdrawn, and fortifications dismantled. Such a town may be occupied, but not bombarded nor destroyed. The immunity apparently does not extend to military installations such as arsenals within the town nor to railway yards, and other facilities in its suburbs. Paris, Manila, and Rome were declared open cities in World War II.

Pacifism (*păs'ĭ-fĭz'm*). An attitude of convinced opposition to war. Pacifists vary in their programs from those who, like Tolstoy, teach a doctrine of pure non-resistance to those who, admitting the justice of defense for the individual and the nation, deplore and oppose all forms of preparation for national defense.

Most pacifists are temperamentally optimistic with regard to human nature and the willingness of nations to compromise. The weakness of this type of pacifism lies in the failure properly to appreciate that the forces of cupidity and inherited antipathy are very powerful in human society and that a sense of the rights of a people is rapidly impaired by a knowledge that it lacks the resolution to defend those rights.

Another school of pacifists takes the view that the profit system is the mainspring of aggressive warfare. Socialists, who advocate production for use instead of profit, claim an end of imperialistic wars as a central merit of their proposals. Likewise the guiding principle of actual and proposed legislation to ensure neutrality, as placed before the United States Congress, has been limitation of profits from war and from preparation for war.

Pair. When legislators who are opposed to each other on a particular measure agree that the vote of one shall cancel the other, it is called a pair, and neither votes. The agreement does not affect the result. It is usually resorted to when one or both has to be absent.

Pan-Americanism. A term produced by newspaper discussion of the international American Conference at Washington in 1889 and 1890. It is the doctrine that the states of the American hemisphere possess certain common interests and institutions not generally shared by the peoples of the Old World, and that these should be the basis of a common understanding and of common political and commercial actions among these American states. Such an idea is involved in the Monroe Doctrine. To give effect to the ideas, the first International American Conference met at the call of Secretary Blaine at Washington in 1889-90. Including one in 1937, eight such conferences have been held. A special one for discussion of peace machinery in the New World was called at Buenos Aires in 1936 at the instance of President Franklin D. Roosevelt.

American advocacy of the Monroe Doctrine has at times advanced the sense of Pan-American unity, and at other times has awakened in Central and South America a sense of irritation and of concern. A considerable body of writers exists in several countries of Spanish inheritance, who assert that the cultural affiliation of those countries is with Europe rather than with the United States.

Pardoning Power. The existence of an executive power of remitting the consequences of a conviction is an almost necessary provision of government. The power frequently is invoked to mitigate the severity of the law, to assume a responsibility which is beyond the competence of a court, to recognize an alteration in conditions taking place subsequent to conviction or in view of new evidence, or to recognize good behavior or reformation of character in a person who has endured a portion of his sentence. Under monarchical government, such power resides in the king, who is the fount both of grace and of justice. The development of constitutional government has transferred this authority to ministers, as to the home secretary in the British government.

In the United States, the pardoning power is constitutionally vested in the president, and, by state constitutions generally, though not invariably, in the governor. A pardoning power usually exists in the legislative branch unless, as frequently under the American system, it has been limited or denied by the Constitution.

Party Platform. A document issued by party leaders or by a party convention, setting forth the principles and the measures for which the party stands and upon which it purposes to make its appeal for the support of the electorate.

Party Whip. A member of a legislative chamber assigned by party leaders to the task of rounding up members of the party to insure their vote on important measures and to hold them in line with party policy. In the British House of Commons, the whips may act as tellers at a "division" of the chamber when important votes are taken. They have other responsible functions of keeping track of sentiment on public matters, of arranging patronage, and, in general, of promoting party solidarity.

It is customary in England for the whips of the party in power to be appointed to the ministerial offices of "junior lords of the treasury," which offices are now sinecures.

The term whip is often used in the United States to designate party leaders in Congress.

Passport. A certificate of identity granted by a government, authorizing the holder to leave the country he is in or to enter a foreign country, and requesting for him safe and free passage and all lawful aid and protection. Passports are issued by the foreign office of a government, or by its diplomatic agents resident abroad.

In the United States, passports may be obtained by applying to the "passport bureau" of the department of state. It is customary for passports to be "viséd" by the representative of the foreign country to which it is proposed to go, in order that any difficulties may be met and surmounted before departure from the home country.

Paternalism. A policy whereby the state assumes to enter into and to regulate the activities of individuals in their social and industrial life. The early part of the 20th century, and to a less degree the latter half of the 19th century, have been marked by an extension of the activities and functions of government, directly opposed to the policy of the 18th century in Europe, which was dominated by the doctrine of "laissez faire," or noninterference by the state. See *Social Legislation.*

Patronage. Places in the government employ at the disposal of persons elected to political office. The term is also broadly used to cover contracts, franchises, and other public favors turned over to preferred individuals or localities by those in power. See *Civil Service.*

Peonage (*pē'ŏn-ăj*). A form of servitude in which a laborer is compelled against his will to remain in the service of his creditor or employer. Peonage arises out of a contract whereby a debtor undertakes to serve a creditor until a debt or an advance of money or goods is paid, or it may result from the operation of law upon mere nonpayment of a debt. The word is derived from the Mexican term "peon," in which country peonage is a long established institution.

Amendment XII to the Constitution, which prohibited "slavery or involuntary servitude except in punishment of crime," made peonage unlawful. Congress, by a law enacted March 2, 1867, further provided that "the holding of any person to service or labor known as peonage is abolished and forever prohibited in the territory of New Mexico or in any other territory of the United States." The law further made the holding of anyone in peonage punishable as a crime.

Personal Representative. Heads of governments have long followed the practice of sending special and often secret agents to secure information abroad and even to negotiate treaties with foreign states. Inasmuch as the Constitution of the United States requires the consent of the Senate to the appointment of ambassadors, other public ministers, and consuls, the conduct of official relations with a foreign government by a personal representative of the president, unconfirmed by the Senate, would seem to be of doubtful constitutionality, and the practice has met with criticism and congressional opposition. Nevertheless, on numerous occasions the president of the United States has dispatched personal representatives on diplomatic missions.

President Washington, in October 1789, sent Gouverneur Morris to England to negotiate a commercial treaty, without having his appointment confirmed by the Senate. Several hundred such representatives, in all, have been dispatched by different presidents. Well-known examples are the mission of Nicholas Trist to Mexico in 1847 to negotiate a treaty of peace; of James H. Blount to Hawaii in 1893 to end a revolutionary movement of Americans against the Hawaiian monarchy; of John Lind and several other representatives to Mexico; and of Edward M. House to Europe by President Wilson. Trist was authorized by President Polk practically to order the American army

and navy to cease active hostilities against Mexico. Blount was endowed by President Cleveland with "powers paramount" to those of the American minister at Hawaii. Lind was sent to force the retirement of President Huerta from the head of the Mexican government.

A survey of the instances in which personal representatives, rather than diplomatic agents confirmed in their appointments by the Senate, have been used by the presidents of the United States reveals the following purposes for which they have been employed: to make special reports on conditions prevailing in foreign countries; to reopen relations with countries with which diplomatic relations have been broken; to interfere in the internal affairs of countries disturbed by revolution; and to negotiate treaties.

The motives that have led to such appointments are the advantages of secrecy, of expedition, and of the opportunity of avoiding a compromising situation in case of failure. Against them may be directed all the arguments in favor of open diplomacy and the constitutional privilege of the Senate to participate in developing the foreign policy of the government and of confirming the appointment of agents through which the promises of the government are expressed and the obligations of the nation are created.

Persona Non Grata (*pĕr-sō'nà nŏn grā'tà*). A term applied to a diplomatic representative who is not acceptable personally to the government to which it is proposed to send him. All countries reserve the privilege of refusing to receive any representatives accredited to them who are thus unacceptable, or to cancel for cause acceptance of such envoys.

Pigeonholing. The laying aside of a bill or other matter by a legislative committee, presumptively for future consideration, but in fact with the intent of allowing the bill to die through failure to act upon it; also similar action by an executive, where such action is equivalent to a veto.

Plebiscite (*plĕb'ĭ-sĭt*). In ancient Rome, a "plebiscitum" was the enactment of a law by the assembly of the "plebs" or common people.

In modern politics, the term plebiscite is given to an expression of the popular will, taken in various forms and for various purposes, such as an alteration in the form of government, change of rulers, or the transfer of territory from one sovereignty to another. The last purpose is of great modern interest, because of numerous provisions, in the treaties of peace that followed World War I, for the holding of plebiscites to ascertain the preference of peoples for the sovereignty of one state or another.

This application of the principle of self-determination arose during the period of the French Revolution, when a plebiscite of the inhabitants of Avignon was taken before the transfer of that city and adjacent territory from the sovereignty of the pope to that of the French republic. The practice was soon abused and discredited.

The plebiscite again came into use in the period 1848 to 1870, especially in the process of the unification of Italy. A plebiscite of the inhabitants of Nice and Savoy accompanied their cession by Piedmont to France. In 1877 a plebiscite was taken of the inhabitants of the island of Saint-Barthelemy in the West Indies, before the transfer of that island from Sweden to France, and again upon the separation of Norway from Sweden in 1905.

The following plebiscites were provided for in the peace settlements following World War I: Allenstein and Marienwerder, districts in East Prussia; Eupen and Malmedy, small districts or "kreisen" on the border of Prussia and Belgium; Upper Silesia; Klagenfurt, lying between Austria and Serbia; Northern Schleswig; and the Saar Basin. These have all been held, resulting in the retention of Allenstein and of Marienwerder by Germany; the cession of Eupen and of Malmedy to Belgium; the division of Upper Silesia between Poland and Germany; and the retention of Klagenfurt by Austria. By a plebiscite the Saar, which was under French control for 15 years, was returned to Germany in 1935.

A plebiscite was provided also for the district of Teschen, in dispute between Poland and Czechoslovakia, but this was abandoned in favor of a diplomatic settlement ratified by the powers.

Plurality. The number of votes received by a successful candidate in excess of the number cast for the next highest candidate for the office. In the election of public officials, the law may be so framed that a plurality only may elect. In such a case, if there are more than two candidates, it may happen that a candidate is elected even though he fails to obtain a majority of the total number of votes cast. See *Majority*.

Police Power. A general term that expresses the fundamental power vested in every state to limit and to regulate the exercise of private rights in the interest of public health, public morals, public safety, and the general welfare of the community.

Under this power, it has been held that a state may absolutely prohibit the sale of intoxicating liquor (*Mugler* vs. *Kansas*) or of cigarettes (*Austin* vs. *Tennessee*), as intrinsically harmful to the health of the community. It has also been held to be within the scope of the police power of the state to prohibit the manufacture of a commodity, such as oleomargarine, which readily lends itself to fraud upon the public (*Powell* vs. *Pennsylvania*).

Under the police power, a state, or, when properly authorized, a municipality, may prohibit within a particular locality the manufacture of bricks, the maintenance of livery stables, public laundries, billboards, public garages, coal yards, slaughterhouses, and the erection of buildings of more than a prescribed height, and may impose any other regulations which are reasonably calculated to secure the public welfare while not unreasonably interfering with the liberty of the individual.

Laws limiting the hours of labor for women and children, prescribing the conditions under which factories shall operate, laws regulating the relative rights of landlord and tenant, as well as those prescribing regulations for buildings used as tenements, are other instances of the exercise of police power. With the growing complexity of society and with the greater interdependence of individuals and classes, the theory of the police power has been extended far beyond the narrow confines to which it once was thought to be limited. Thus antitrust laws, although directly interfering with the liberty of contract, and statutes prohibiting the sale or use of trading stamps, have been upheld (*National Cotton Oil Company* vs. *Texas*; *Tanner* vs. *Little*). Zoning ordinances designed merely to promote the æsthetic interest and general welfare of the community are constitutional exercises of the police power (*Lincoln Trust Company* vs. *Williams Building Corporation*).

In the last analysis, whether an act is within the police power of the state depends upon a judicial balancing of interests—that of the individual in the unlimited use of his property and the unrestrained pursuit of his own inclinations on the one hand, and that of the rest of the community and of the state on the other.

Populism. Term applied to the series of reforms advocated by the People's or Populist party in the United States. Chief among these reforms were the free coinage of silver at the ratio of 16 to 1, the creation of a national paper currency to replace the national bank notes, stringent government regulation of railroads and of monopolies, and a general policy of legislation directed against the alleged control of the government by financial interests.

Pork Barrel. A term applied in the United States to appropriation bills for federal expenditures in various parts of the country. So termed because each congressman secures his "piece of bacon" to bring back to the "folks at home." See *Logrolling*.

Pourparler (*pōōr'pär'lā'*). An informal, preliminary conference of representatives of different groups, factions, or countries, looking to a formal agreement settling disputed questions between the parties.

Preferential Voting. See *Proportional Representation*.

President Pro Tempore of the Senate. One of the members of the Senate elected by that body to preside over the Senate during the absence of the vice president, who is normally the constitutional presiding officer. Should there be a vacancy in the office of vice president, the president pro tempore would preside regularly.

Pressure Group. Advocates of a cause who bring pressure to bear on lawmakers by lobbying or other means to compel passage of legislation they favor. They also use propaganda to convert public opinion to their views to add to the pressure, or to bring about a change in public policy. See *Lobbying*, *Propaganda*.

Primary. A preliminary election, held by voters of a party to determine the party's candidates for office. When carried out by a legally prescribed election and as a substitute for local meetings or conventions, it is generally termed the "direct primary."

In the "nonpartisan primary," all aspirants to office, regardless of political affiliation, enter the primary election, and members of all parties are eligible to vote. The two candidates receiving the highest number of votes for any office are regarded as nominated, and these two then compete against each other in the final election.

Prime Minister. A term applied to the head of a ministry, particularly in Great Britain and in member states of the British Commonwealth. He is called also "the premier." In France, he is legally termed "the president of the council of ministers."

Privileges and Immunities of Citizens. The 14th Amendment to the Constitution of the United States provides that "No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the

United States." These privileges and immunities are incidents of federal citizenship. They include the right to protection of life, liberty, and property on the high seas and in foreign countries; the right peaceably to assemble and petition the federal government for redress of grievances; the right of habeas corpus; the right to use the navigable waters of the United States; the right to hold office under the federal government; and the rights secured to citizens of the United States by treaties with foreign nations.

Article IV, Sec. 2, of the Constitution provides that "Citizens of each state shall be entitled to all privileges and immunities of citizens in the several states." These rights include protection of life, liberty, and property under state law; the right to sue in the state courts; the right to engage in any lawful business; and the right to acquire and to devise or bequeath property. See *Civil Rights and Liberties*.

Prize Courts. Tribunals of a belligerent state, established for the purpose of adjudicating the title to property captured by its citizens on the high seas, and of examining the nationality of such property.

Prohibition. Governmental action which prohibits by law the manufacture and the sale of intoxicating liquors except for medicinal or sacramental uses. In the United States, the first state prohibition law was enacted in Maine in 1851. Between that date and 1920, nearly half of the states, at various times, enacted laws prohibiting or strictly limiting the manufacture and sale of liquor. The 18th Amendment to the United States Constitution (in force January 16, 1920) made illegal the manufacture and sale of liquors containing more than one-half of one per cent of alcohol. The ensuing 13 years provided a working test of the policy. The prohibition, fairly effective at first, became less so as time went on. Bootlegging of liquor on an unprecedented scale diverted large sums of money to criminal elements of the population. These and other considerations led, in 1933, to the adoption of the 21st Amendment to the Constitution, repealing the earlier one but giving Congress power to prevent transportation of liquor into states where its sale is illegal.

Propaganda. This term is used to describe any means of instilling or promoting ideas favorable to a cause or organization, particularly in the field of politics. Usually, this is accomplished by indirect or incidental means, as by suggestion, insinuation, or by more or less subtle appeals to prejudice. If the propaganda is sufficiently clever, the victim is led to think that he has arrived independently at impressions that have been introduced into his mind by someone else. Propaganda may be conveyed by news articles, plays, motion pictures, or even in conversation. The word itself has a respectable origin, in the sense of missionary work. Its evil repute comes from its political use in spreading half truths by illicit methods.

Proportional Representation. Any one of a variety of plans designed to give minority parties or groups representation in a legislative body, in proportion to the relative strength of each minority group as shown in elections; frequently called also "minority representation."

Such a plan was first tried on a national basis by Denmark in 1854 and was successfully adopted by Belgium in 1899.

History of the Movement. Proportional representation was discussed and advocated for both national and local elections for about 60 years preceding World War I, but, before 1914, it was adopted only for the choice of national representatives, by several smaller states, as Denmark in part, Belgium, Sweden, Bulgaria, Serbia, and Portugal.

During World War I, the system was adopted by Holland and was extended in Denmark. It appears in most of the new postwar constitutions; Germany, Austria, Czechoslovakia, Jugoslavia, Danzig, Greece, Poland, Esthonia, Latvia, Lithuania, and Bulgaria. France adopted it in 1919 but in 1927 returned to the uninominal system. In Switzerland, it was adopted nationally by an initiative proposal in 1918.

Plans in Use. Of the several plans, the following may be mentioned:

(1) The "limited vote" plan. Each constituency or district elects several representatives, but each voter therein casts a ballot for a number of candidates, less than the number of seats to be filled, giving his vote but once to any one candidate. A minority, by limiting its nominees, may be large enough to elect one or more candidates. This system was applied to certain constituencies in England in 1867 but was abolished in 1885.

(2) The "cumulative vote" plan. Each voter has as many votes as there are places to fill, but he may cast all his votes for one candidate or may distribute them between candidates, as he chooses. Here again, a minority party, by limiting its nominees, may elect. This device was used for election to the legislative council of Cape Colony before the Union of South Africa was formed. English school board elections also have used this system, and the state of Illinois employs it to elect its House of Representatives.

(3) The "single vote" plan. In each constituency, though there may be more than one place to fill, each voter is allowed to cast his ballot for one member only. Minorities, by this plan, may elect if they confine nominations to the number of candidates their voting strength represents. Japan has used this system since 1900, and her experience shows that quite close approximations to the results of more elaborate methods of proportional representation may be obtained.

(4) The "single transferable vote," known as the "Hare system." First used in Denmark in 1855 and adopted in 1909 by the Union of South Africa. Each voter indicates on the ballot his first, second, third, etc., choice. A "quota" determining the number of votes necessary for election is obtained by dividing the total number of votes by one more than the number of places to be filled and by adding one to this number. When all the first choices are counted, if a candidate is found to have the quota, he is elected. If there are surplus votes, they are transferred by various methods under various systems to other candidates as indicated by the ballot. The Hare system of preferential and proportional representation has been adopted in a few cities of the United States and Canada.

(5) The "list system." Lists of candidates are nominated by political organizations or groups of voters. Each voter has as many votes as there are places to be filled, but he may not "cumulate" them. The number of votes registered by a group or party is used to determine the number of elective candidates of the group. There are various ways of apportioning seats under this system, but the most widely copied is "the d'Hondt system" in Belgium, known from its originator. It may be made clear by illustration. Suppose an election for 5 seats, and 4 party lists obtain 24,000, 11,000, 9000, and 3000 votes, respectively. These figures are then divided by two, with results of 12,000, 5500, 4500, 1500; by three, with results of 8000, 3666+, 3000, 1000; if necessary by four, and so on. As there are 5 seats, the 5th largest of the figures thus obtained (in this case 8000) becomes the "quotient." By dividing the party votes by this quotient, we obtain the number of seats to which each party is entitled; namely, 3, 1, 1, and 0.

Protective Tariff. See *Tariff*.

Protectorate. A country or territory under the political control and protection of another. A protectorate invariably represents some restriction upon the foreign relations of the country, and may extend to complete control of them. Usually foreign authority is exercised also over the financial affairs and obligations of the protectorate. A nation claiming or exercising such protection becomes responsible to other nations for the protectorate's regard of international obligations, and the tendency is to go even further and admit responsibility for internal order and well-being.

Protocol (*prō'tō-kŏl*). A preliminary agreement between two or more countries, intended to form the basis of a more formal and complete treaty.

Public Lands Policy. Over two-thirds of the total area of the United States, including Alaska and consisting of over 1,800,000,000 acres, has at some time been the property of the nation. The development of this vast public domain into farms and homes, privately owned, has been one of the most important policies of the American government, and its carrying out has profoundly influenced the development of American society. Of this original domain, there remains about 400,000,000 acres, mostly arid or otherwise unfit for settlement. The rest has been distributed.

The Constitution gave to Congress the right to dispose of public lands, and under this power Congress has developed a public land policy, which, however, has taken several different forms. In the beginning it was believed that the sale of these lands would produce a considerable revenue and, among other common benefits, would extinguish the public debt. Accordingly, large tracts were sold to companies for subdivision and speculation. After 1800, small tracts were sold to settlers on credit. In 1820, a system of cash sale was adopted, the minimum price being reduced from $2.00 to $1.25 an acre. Public land was frequently occupied by settlers in advance of government surveys, and without negotiation with government agents. These settlers, known as "squatters," came to be recognized as having prior claims to the acquisition of lands which they had improved.

Homestead Policy. The policy of using the public domain to encourage national development received complete recognition in the "homestead law" of 1862. This act permitted any head of a family to secure 160 acres, or a quarter section of land, by residing on it for five years. Amendments changed the law so as to extend the privilege to any person 21 years of age or older who was a citizen or had declared his intention to become a citizen.

For homesteads in certain arid regions, Congress extended the acquirable tract to 320 acres, without the necessity of residing on the land. On other tracts, designated as "grazing lands," the law permitted the acquisition of 640 acres. An act passed in 1878, and in 1892 made applicable to all public lands, allowed the outright purchase of 160 acres of unappropriated nonmineral land unfit for cultivation but valuable for timber or stone, at a minimum price of $2.50 an acre.

Land Grants to States. The government has also granted public lands to states, to individuals, and to corporations, for specific purposes. Previously to 1850, one section out of each 36, within a state, was granted to it by the national government for support of education. Since 1850 the amount has been doubled. In 1860 the "Morrill act" granted each state an amount of land for the support of a college of agriculture and mechanic arts. This measure forms the basis of a large number of western state institutions. Extensive grants of land were made to the soldiers of the Revolutionary and Mexican wars, as compensation for their military service. To encourage the building of railways, particularly the transcontinental systems, Congress granted large areas of public land along the lines of these railways through undeveloped country, such grants amounting to more than 155 million acres.

Conservation. The "Desert Land act," as amended in 1891, enabled settlers to obtain 320 acres by bringing the land under irrigation within three years' time and expending not less than one dollar an acre for improvements. The government has undertaken also the reclamation of arid and swamp lands.

In the 20th century a conservation policy has been defined, designed to preserve the remaining public domain from wasteful exploitation. Under this policy, the timber, the minerals, and the surface of the lands are disposed of separately, and water power sites have been withheld from entry.

Congress also granted authority to the president to withdraw the public domain from private acquisition and to create extensive reservations, either as "forest reservations" or as "national parks." Nearly 200 million acres are included in forest reservations in the West.

All unappropriated land was withdrawn from settlement by an executive order in 1935 signed by President Franklin D. Roosevelt. This move was in accord with recommendations of a national resources committee which the president had commissioned to report on the best use of land and other natural resources. Among the points made by the committee was the fact that much land unfit for cultivation was nevertheless being tilled. Farmers so engaged, who required public relief for their support, were given aid in acquiring better land elsewhere through the agency of a federal resettlement administration. At the same time an extensive land-purchase program was carried out, the land so acquired being reforested or otherwise used as appeared desirable.

Public Ownership. See *Government Ownership, Municipal Ownership, Socialism.*

Punishments, Cruel and Unusual. The English Bill of Rights 1688 contained a provision, forbidding the infliction of "cruel and unusual punishments." This provision has been incorporated in the Constitution of the United States, in the 8th Amendment, and in the constitution of nearly every American state.

"Cruel and unusual punishments" within these provisions are such punishments as are revolting to the civilized mind, or involve torture and lingering death. However, a punishment wholly disproportionate to the crime committed may, under some circumstances, constitute a "cruel and unusual punishment."

Recall. A process for removing an elective official from office before the expiration of his term. This method is entirely distinct from impeachment, as the latter is applicable only in case of gross malfeasance or breach of trust. The recall is initiated by a petition signed by a designated percentage of the electorate. Within a certain period after the filing of the petition, a recall election is held, in which the official against whom the recall is directed is compelled to contest for the office with one or more candidates who have been nominated to replace him.

Recall of Judicial Decisions. A process whereby the decision of a court declaring any law unconstitutional may be submitted to a popular referendum initiated by petition, and, in the event that the popular vote is favorable to the law, the court decision is disregarded and the law is enforced notwithstanding. The incorporation of such a provision in the United States Constitution would be tantamount to providing a special method of amendment by a mere majority vote.

Colorado is the only state where the recall of judicial decisions has been adopted, with specific limitations.

Reciprocity. An arrangement between two or more countries whereby each admits the exports of the other duty free, or at rates more favorable than those applied to similar importations from other countries.

Reciprocity provisions were incorporated in the American Tariff act of 1890. The method of making them effective was to empower the president to impose higher duties on certain imported articles if the foreign countries from which they came should appear to have imposed, upon products of the United States, duties which might be deemed to be "reciprocally unjust or unreasonable." See *Tariff.*

Red Tape. An expression signifying official formality and delay. It owes its origin to the red tape usually employed in tying up public documents. The phrase is said to have been first used in this sense by Lord Minto in 1775.

Referendum of Laws. (See also *Direct Legislation.*) A constitutional procedure whereby a measure enacted by a legislature may be subjected to the judgment of the people before becoming effective.

The referendum has been closely associated with the initiative of laws; but the two procedures differ in character, the referendum being conservative in its nature, and the initiative, radical. The referendum, as well as the initiative, in its modern use, has been most highly developed and employed by Switzerland, and it was from this country that the influence came which lead to the adoption of these procedures for ordinary legislation in American states.

The referendum may be "optional" or "obligatory." An optional referendum occurs when a legislature provides that a measure shall not become effective until approved by the voters of the jurisdiction affected. In this form, the referendum was common in the United States even before 1898, the year when the popular referendum of statutory laws was adopted by South Dakota, and was applied particularly in such matters as county division and creation of bonded indebtedness.

Under the obligatory use of the referendum, a law is suspended, usually for 90 days, to provide an opportunity for the voters to scrutinize the measure and by petition of a certain number, to compel its reference to popular judgment at a general election. There may be exception of certain law, called "emergency measures," such measures usually requiring for passage an extraordinary majority of votes in the legislature.

Besides the "popular" referendum of laws, recent constitutions have provided other means whereby legislation may be submitted to the judgment of the voters. In Sweden, by a constitutional enactment, there is a referendum of laws if the government and the national legislature concur in its submission.

The popular referendum has made no progress in the Latin American republics, but in some of these countries, according to an old practice, acts of the government are referred to the councils of the municipalities for approval.

There appears to be a growing practice to except certain measures of the legislature from the operation of the referendum. The constitution of the state of Massachusetts, the last American state to adopt the referendum, exempts from its operation a large group of subjects.

In the United States, 39 states have adopted the referendum in some form.

The referendum is a popular safeguard against hasty or corrupt action of legislatures. In the United States its adoption was distinctly encouraged by distrust of state legislatures. This dissatisfaction, at an earlier period of constitutional amendment, took the form of placing in the state constitutions a wide variety of limitations upon the legislative power. The substitution of the referendum for this precaution would seem to recommend the repeal of many existing constitutional limitations which now unduly limit and embarrass the work of state legislatures. See *Referendum and Initiative of Laws.*

Representation. This is the device by which a citizen participates in government by proxy through an elected representative. Representation is direct when the citizen may vote for the candidate; it is indirect when he helps elect a body which in turn may vote for the candidate.

Direct representation in most countries is arranged so that electorates for each candidate have approximately the same population; hence the vote in each electorate is considered to have the same weight. It is to preserve this principle that Congress reapportions Congressional districts after the taking of a census. This does not apply to the Senate, to which each state elects two senators regardless of the state's population.

In 1964, the Supreme Court ruled that the clause of the Constitution guaranteeing equal protection of the law requires apportionment of both houses of bicameral state legislatures on a population basis. It held that the analogy of the United States Senate does not permit election of one state senator from each county regardless of population. This decision had the effect of ending a situation in which a disproportionate weight was given to rural districts as compared with urban districts.

Republic. A political community in which government is exercised, not by a monarch or hereditary rulers, but by and for all the people through their representatives. The term derives from the Latin words *res publica* ("commonwealth"), which was applied to Rome when the kings were expelled and elected officials were entrusted with the welfare of the state. Its use survived to describe Rome's government long after the emperors took over power from elected representatives.

The word has been applied to the aristocratic government of the medieval Italian cities. When the United States rid itself of the power of the British monarch, it followed the Roman example of calling itself a republic. Each non-monarchical government of France has so designated itself. The Latin American countries, after throwing off the yoke of Spain and Portugal, proclaimed themselves republics. The Communist governments of the 20th century without exception called themselves republics. The same is true of all the new states arising after World War II whenever they rid themselves of monarchical institutions.

It is obvious from the above that a republic is not necessarily a democracy, in which effective control is exercised by the majority of the people. Some political writers have tended to equate the two terms, and this fact has doubtless had an influence when newly independent countries chose political titles. Many of the Communist countries, in their excessive claims to popular sovereignty, call themselves republics.

A national monarch may be an impressive and useful symbol of strength, unity, and devotion, and, under such a guise, monarchy in all ages has appealed to popular admiration and has commanded intense devotion. The conception of a republic, in which the central personal leader is lacking or is transitory, undoubtedly calls for higher political development and is successful only by the display of higher popular political capacity.

Republicanism rejects not only kingship, but hereditary caste, class privileges, and hereditary distinctions. The price of this repudiation and of the refusal of these great rewards to political ambition is the frequent inability of republics to command and to keep in the public service the highest talent of the nation.

Residence. Legally, the place where one habitually resides or sleeps. Residence differs from "domicile" in that the latter term generally designates a more permanent attachment to a particular place, and includes the intention of remaining in that place indefinitely, while residence may connote a less permanent habitation. One may possess two residences, but he can have but one domicile, at any particular time. In the U.S., voting privileges and eligibility to office usually are limited to one place of residence.

Retroactive Legislation. A law made to apply to acts performed or to conditions existing prior to its enactment.

Revolution, Right of. The right of the people to revolt against the established government whenever that government becomes tyrannical or fails to afford public satisfaction.

This right was particularly asserted by such writers as Locke in England (1689), by Rousseau in France, and by Thomas Paine during the American Revolution. The Declaration of Independence, in which the ideas and even the language of Locke are used, is based on the assertion of this right.

The right of revolution is particularly opposed to the doctrine of legitimacy of royal rule or of "divine right."

Rider. A measure, the passage or executive approval of which seeming doubtful, is "tacked on" to a bill which is assured of passage, such as an appropriation bill, in order that the doubtful measure may "ride in" on the strength of the main bill.

This device is frequently effective in the federal government of the United States because of the inability of the president to veto a part of a bill, without invalidating the whole. In many states, however, the governor is now given the power to veto part of a bill and to ratify the remainder.

Right and Left. In legislative bodies of continental European countries generally it is the fixed habit of the conservative groups and parties to seat themselves on the right hand of the president or speaker, and of the liberal or radical elements to seat themselves on the left. The terms have thus come to be used as indicative of conservative and radical position on political matters; and, with the differentiation of positions within the group, the expressions "extreme right" or "extreme left," etc., have come into vogue. Thus the socialist party, which is always a left group, is divided into "right and left wings" according to the moderate or the revolutionary character of the group. The term "center" is used for middle parties or groups.

Roll Call. If one-fifth of the members present of either house of Congress wishes a record of the yeas and nays on a particular measure, a roll call vote showing how each member voted must be taken and published in the *Congressional Record*.

Roorbach or **Roorback.** A libel, or falsehood of a defamatory nature, used for political ends. The word had its origin in the presidential election of 1844, when a forgery of this nature was published to the detriment of James K. Polk. It was supposed to be an extract from the *Travels of Baron Roorbach*, but was later traced to G. W Featherstonhaugh's *Tour*, whence the malicious statement had been drawn by a newspaper writer, William Linn.

Sabotage (*sa'bô'tàzh'*). The wanton destruction of the property of employers by laborers, or the practice of various means to slow down or stop production, to damage machinery, to discourage employers, and to make capitalism unproductive. As a resort for the enforcement of labor demands, it is a substitute for the strike. As stated by an advocate, "it means to strike but stay on the pay roll." It is particularly advocated by the revolutionary element among the working class as a means to end private ownership of productive capital.

The modern practice of sabotage arose among the radical French labor circles known as "syndicalists" (See *Syndicalism.*), and the term is derived from the supposed practice of a French workingman of throwing his wooden shoe, *sabot*, into moving machinery, thereby causing wanton damage.

Sabotage, or the destruction of private property, began to be advocated and practiced in the United States about 1910, particularly by members of the "Industrial Workers of the World." (See *I.W.W.*) It was advocated also during the first years of World War I by sympathizers with Germany, as a means of stopping the production of munitions furnished to the Allies. During World War I and immediately thereafter, legislation, called "syndicalist laws," was passed by many American states, severely punishing the practice of sabotage and even making it a crime to advocate such doctrines.

Satellite. A country which is under the political and economic domination of a stronger power.

Scratching. The practice, by American voters, of marking out from a party ballot one or more of the regularly nominated candidates. It is the opposite of voting a "straight ticket."

Sectionalism. The advocacy of measures or policies designed to promote the interests of a particular section rather than the good of the country at large.

Self-Determination. The principle or proposal that every distinct people or nation ought to have the right to determine the question of its independence, its form of government, and its political destiny. The phrase appears to have originated in the "Manifesto to the Proletariat" adopted by the conference of antinationalist socialists, held at Zimmerwald, Switzerland, in September 1915. This manifesto summoned the propertyless workers of Europe to a battle for peace "without annexations or war indemnities." Neither whole nations nor separate sections of nations were to be forcibly incorporated into states. "The right of self-determination of peoples," it declares, "must be the indestructible foundation of the creation of national relations." The Zimmerwald conference was attended by Lenin and by other Russian socialists, and among the early declarations of the Bolshevik revolutionary government in Russia was a pronouncement for "no annexations, no indemnities, self-determination of peoples."

Stated in a broad way, this declaration would seem to be equivalent to the principle of "government with the consent of the governed." On some such understanding, the principle of self-determination was championed by President Wilson in his proposals for world peace, preceding the entry of the U.S. into World War I, and particularly in his program presented to the Paris Peace Conference. In President Wilson's mind it was associated with a league to maintain the rights of peoples and with the probable reduction of certain great states into a number of minor sovereignties. In Paris the phras became a shibboleth leading to demands by numerous peoples for national independence. Its practical result was seen in the dissolution of the Austro-Hungarian Empire and in the emergence of new states, such as Poland, Estonia, Latvia, Lithuania, Czechoslovakia, and Ruthenia, and particularly in the declarations of independence of numerous small republics within the area of the former Russian Empire. The phrase also had great influence on political movements in Ireland, Egypt, Persia, the Ottoman Empire, and elsewhere.

Difficulties of Application. In spite of the glamour attending a declaration seemingly so democratic, the principle is difficult of application and may even lead to political reaction. Much depends upon what constitutes a small nation or people with the presumptive right to separation and self-government. Peoples are not wholly independent, economically, politically, or morally, especially where they have previously been united under a common sovereignty. Dissociation inevitably carries with it the repudiation of certain obligations involving hardship,

injustice, and, almost inevitably, economic injury to all parties. Particularly has it led to the setting up of new economic barriers, where freedom of trade and movement formerly existed, to the stimulation of animosities, and to a particularism dangerous to political unity and stability. Political progress, according to one well established ideal, is toward the uniting of the human family into larger political units, with a consequent suppression of national prejudices, rivalries, and retaliations, either political or economic. The multiplication of small states, in this point of view, must be regarded as a backward step. For the great nations, particularly when composed of peoples presenting local differences, united under some form of federal government or empire, the principle is a disintegrating one, dangerous to their existence. Strictly applied, the right of self-determination would have justified the separation of the Southern Confederacy from the American Union, or the division of any state on grounds satisfactory to the seceding portion.

Senate. The upper legislative chamber in the Congress of the United States and in each of the 50 states of the Union except Nebraska; also a similar body with the same name in a number of other modern governments.

The happy agreement in the American constitutional convention to give to all the states equal representation in the Senate made possible the acceptance of the Federal Constitution. This feature has been successfully copied in the "senates" of other federal governments, including Canada, Australia, South Africa, Mexico, and Argentina, in the Union of Soviet Socialist Republics (Russia), and in the Swiss "Council of States."

In a large number of other governments, American and European, which are not federal, the upper chamber of the national legislature has been given the name of Senate. The list includes France, where in 1875 a Senate was added to the National Assembly; Belgium under the constitution of 1831; and, more recently, Italy and Cuba.

It is the general practice, following the American provision, to set a higher age qualification for eligibility to a senate, to fix a longer term than for the lower house, and to renew the senate by degrees, thus giving it a continuous life and a slowly altering membership. The net effect is believed to be to increase the conservative character of the government.

Senatorial Courtesy. A custom whereby the president, in making nominations to Federal offices, is expected to consult the United States senators from the state in which the vacancies exist before submitting nominations to the Senate for confirmation. Where the senators are of a different political party from the president, the custom is not applicable.

Separation of Powers. A principle of government which sharply separates the executive, legislative, and judicial branches of the government, confining each to its special sphere and making each independent of the other two.

The principle was enunciated by the French political writer Montesquieu in his *Spirit of the Laws*, and was, actually, a misapprehension of the British constitution as it existed in the 18th century. To the supposed separation of powers and the "checks" upon arbitrary action which it secured, Montesquieu attributed the security of English freedom.

The theory of Montesquieu was much regarded by the founders of independent government in America and by them the separation of powers was proclaimed as an indispensable element of free government. Many state constitutions endeavor specifically to apply it and to make it mandatory. The constitution of the state of Massachusetts, of 1780, declares: "In the government of this commonwealth the legislative department shall never exercise the executive and judicial powers or either of them; the executive shall never exercise the legislative and judicial powers or either of them; the judicial shall never exercise the legislative and executive powers or either of them, to the end that it may be a government of laws and not of men."

As a matter of fact, the precise principle never existed in England and has not been truly realized in the United States. The president and the state governors participate actively in legislative programs and exercise a veto over laws. Courts have been intrusted with numerous executive functions, and, by judicial interpretation, they expand or nullify legislation. In the commission type of government, the theory is entirely abandoned.

Serfdom. A status of personal servitude whereby the peasant is deemed bound to the soil upon which he is born, and is required to perform certain services and to give to his lord a certain proportion of the yield of the land. On the other hand, the peasant may legally be entitled to the protection of his lord and to certain assistance, and may have rights to his holding of which he may not arbitrarily be dispossessed.

Serfdom is closely connected with the institution of feudalism. It existed generally on the continent of Europe until the close of the 18th century. The French Revolution suppressed it in France and in other countries to which the Revolution extended. In Prussia it was ended by the edict of Stein in 1807. In Russia it continued until the emancipation of the serfs by the czar Alexander II in 1861. Until the reform of the landholding system in 1871, Japan had a feudal form of society, in which the status of the tiller of the soil resembled European serfdom. Its last traces in England disappeared in the reign of Queen Elizabeth.

Single Tax. A principle of taxation, advocated by Henry George in his work *Progress and Poverty*, published in 1879, whereby all increase in the value of land would be appropriated by the state as a substitute for other taxes. The principle rests upon the theory that the appreciation of value of unimproved land is an "unearned increment" due to the growth of society itself, and not to the exertions or investments of the owner. Thus the owner justly may be deprived of this increased value by land taxation sufficiently heavy to absorb it.

The theory has attracted less attention in the United States than in Great Britain, where vast private estates held in an unimproved condition invite the application of the doctrine. It has been sparingly applied in certain cities of the United States and Canada.

Smuggling. Illicit importing of goods into a country without submitting them to the customs authorities or paying legal import duties.

Social Contract. The theory that the state originates in a contract between individuals, whereby the freedom and the equality of the "state of nature" are surrendered for the advantages of state protection and authority.

The theory fills a large place in the history of political philosophy, particularly in the writings of Hobbes, Locke, and Rousseau. Thomas Jefferson and many of the political thinkers of the time of the American and French revolutions rested their governmental doctrines upon this theory of the origin of the state, and from it deduced their justification of the right of revolution, or of dissolving the social compact.

As a historical explanation of the origin of political society, the social contract theory is rejected by modern students of government.

Socialism. A social program whereby private ownership of land and of all other "productive capital" would be extinguished in favor of ownership by the state.

The present-day orthodox theory of socialism is that expounded by Karl Marx, particularly in his work *Capital*, published in 1872, although the essential ideas were expressed in the *Communist Manifesto* issued in 1848 by Marx and Engels.

The distinctive feature of Marxian Socialism is the doctrine that the socialist state will arise inevitably out of the evolution of modern industrialism. Marx predicted a progressive and inescapable concentration of the means of production in the hands of the few, until there would remain but a few capitalists, or bourgeois, on the one side and the rest of the community of propertyless workers, or proletariat, on the other. The so-called "middle class" would entirely disappear. When this stage had completely evolved, modern industrialism would be "mature," and revolution, either peaceful or bloody, would be inevitable. The masses would take from the capitalists control of the means of production and would operate them in the interest of the community. The socialist state would arrive.

Economic Crises. The chief impetus toward the transition is held to be economic crises, or depressions. Their recurrence is represented as inevitable under capitalism. From the Socialist point of view, these crises serve the double purpose of speeding up the concentration of "productive capital" in the hands of the few and creating active discontent in the involuntary idle. These results are expected to lead to a demand that society should plan its production so as to use the services of all who wish to work.

Half a century after the death of Karl Marx, Socialism passed from the realm of political theory to a testing laboratory, so to speak. That is to say, it was adopted by Russia. Its evolution there did not follow the sequence predicted by Marx, since capitalism was much less advanced there than in many other countries.

Socialism and the Nation. Orthodox socialism repudiates national allegiance in favor of loyalty to the "proletariat of all lands." It views the modern state as the buttress of capitalism and as the means for "imperialistic aggressions" in favor of the capitalist class. In World War I, while the socialist parties generally supported the governments of their respective countries, an extreme international wing in each belligerent state repudiated the war aims of its nation and even sought its defeat or overthrow. A so-called "Third International," with headquarters at Moscow, directs the policy of those working in separate nations for the realization of Socialist aims.

To Marx is due also an "economic interpretation of history" in which all human activity and social development are held to be controlled by economic motives and causes.

Social Legislation. Under this term is embraced a wide variety of measures designed to protect terms of employment and to improve the general well-being. Modern legislation of this character followed the rise of the factory system in England and in Continental Europe and the industrial inventions which revolutionized industry in shops, mines, and transportation.

Legislation in England. During the first decades of the 18th century, there prevailed a doctrine of *laissez faire*, or complete abstention of government from interference in the conditions of employment and in the relations between employer and laborer. Such interference was held to be an unwarranted trespass upon the freedom of employment and of labor and an unwise disturbance of the law of supply and demand. Factory and mining conditions, however, became so deplorable as to lead, in 1802, to the beginnings of English social legislation, the first law,regulating the labor of "bound" children. Such legislation was at first confined to the protection of the health, safety, and morals of children and women. In 1842, a working day in excess of 10 hours for women and children was prohibited. The English example was followed in many other industrial countries toward the end of the 19th century, and the program was vastly expanded in the 20th century.

Legislation in America. In the United States, laws have been passed for the protection of the laborer from the following hazards of employment: dangerous gases, acids, and dusts, poisonous and nonpoisonous; harmful bacteria and micro-organisms; compressed or rarefied atmospheres; improper lighting; extremes of temperature and of humidity; and excessive physical or mental strain. Many laws have been designed to prevent accidents both to employees and to the public, and to require the installation of provisions for safety in dangerous employments, such as mining. Child labor is limited or prohibited in most states. Federal laws prohibiting employment of children having been ruled invalid by the Supreme Court, a constitutional amendment was submitted to the states in 1924 which would empower Congress to regulate or prohibit the employment of persons under 18 years of age. It was not ratified, but the situation was saved when the Supreme Court held that the child labor restrictions in the Fair Labor Standards Act of 1938 were constitutional.

Old Age Pensions. These are of two kinds—aid for the needy aged and annuities based on the employment history of the individual. The first kind is a contribution to be matched by states and paid on a non-discriminatory basis to indigent persons over 65 years old. These are the assistance grants paid out of federal and state appropriations and are distinct from the Social Security insurance programs financed by taxes. (*See Social Security.*)

Unemployment Compensation. The Federal government does not directly administer this program. Its part is to collect a pay roll tax and to hand the proceeds, less administrative expenses, over to States for carrying out their own programs provided these programs meet the standards laid down in the Federal law as interpreted by a social security board. Those who have been employed for a minimum period and then lose their jobs are entitled to unemployment compensation for a limited number of weeks. Details differ from state to state. Funds are raised by an impost on pay rolls of employers.

Provision is made also for Federal contribution to states on a matching basis for aid to dependent children and for child welfare. This includes support for needy mothers with children to support. Each state program must be mandatory and uniform in all districts as a condition of receiving Federal contributions.

The Minimum Wage. Legislation has also been passed establishing the "minimum wage" that may legally be paid in certain industries. The theory of a minimum wage is that it corresponds to the lowest compensation which will afford a livelihood that is not destructive to health and to self- respect.

Social Security. Legislation to insure workers against the hazards of industrial life was first enacted by Germany, a law of 1883 providing for sick benefits. Such benefits have been widened in many countries to include compulsory accident insurance, unemployment compensation, aid for dependent children and invalids, and old age pensions.

A landmark in social legislation in the United States was the enactment, August 14, 1935, of a comprehensive Social Security law providing for old age pensions, unemployment insurance, and aid for dependent children and the blind. Under this act, a wage earner contributes part of his or her earnings in the form of a tax (5.85 per cent or more, according to schedule), which is matched by an equivalent payment made by the employer. In return the worker is entitled to receive upon retirement at age 65 or total disability a monthly benefit based on his average earnings over a given period. Until he reaches age 72, a retired person receiving Social Security benefit is allowed to supplement his income by earnings up to $2400, or slightly more with some benefits withheld. After he passes age 72, no limit is placed on his supplementary earnings.

From time to time following the passage of the original Social Security Act, Congress has broadened its coverage to include different classes of employed persons like farm owners and farm hands, household workers, and self-employed persons such as professional people engaged in different lines of activity. Men and women are permitted to retire at 62 with reduced benefits. The law has operated under the Department of Health, Education and Welfare.

Medicare. This is a program of health insurance for persons over 65 years of age. As adopted in 1965, it consists of hospital insurance and medical insurance. Hospital insurance is financed entirely from social security taxes. It pays most of the cost of hospital service. Medical insurance is voluntary and is financed half from social security taxes and half by a fee withheld from recipients of federal old age pensions.

Sovereignty. The ultimate or supreme political authority in the state. In a democracy, sovereignty is vested in the people; in an absolute despotism, it is in the monarch.

Soviet (*sō'vyĕt'*). Russian term for a council or deliberative body; used particularly with reference to the village, city, county, and provincial councils, composed of deputies elected by the workmen, soldiers, and peasants, which form the basis of the Russian Soviet government and constitute the governing bodies of the local districts. See *Russia.*

Speaker of the House. The presiding officer of the U. S. House of Representatives elected from its own membership. The Speaker may vote but generally does so only to break a tie. He is first in line after the Vice President in order of succession to the presidency.

Sphere of Influence. A "sphere of influence" or a "sphere of interest" is a region, frequently the territory of another recognized state, within which some foreign power claims a position of preponderant or "special interest." The conception arose in the "partition of Africa" by the European states, which followed rapidly after 1884. In these settlements, which were partly arranged at the Berlin Conference of 1884-85, the entire seaboard of Africa, not already possessed, was distributed as colonial possessions or protectorates among the European states, particularly Great Britain, France, Belgium, and Germany. In addition, the interiors or "hinterland" covered by the coastal possessions were declared to be "within the sphere of influence" of these particular states. The agreement aimed to establish rights of subsequent penetration and development over areas of Africa which the colonizing powers were not at the moment prepared to occupy effectively.

Subsequently the conception was applied to China, where vast areas of that country were more or less definitely accorded by one European power to another as a sphere in which economic and political preference was recognized. The foreign country claiming a sphere in China endeavored to maintain a claim of exclusive or preferential opportunity in railroad building, in mineral development, and even in financial and political affairs. Such claims disappeared everywhere after World War II.

Splinter Group. A group which has seceded from a larger parent political organization.

Stampede. A break in the balloting at a nominating convention, when the great majority of the delegates desert the candidates whom they have hitherto supported, and rush to the support of the candidate who appears likely to be the nominee.

State, The. The word "state" is popularly used to denote a country, such as France. It is used also, both popularly and legally, to designate the constitutent parts of the United States, as, the state of Ohio. In this latter sense, the word is applied to the parts of the commonwealth of Australia, as, the state of Queensland.

As used in political science, the term "state" implies a body of people organized for government within a definite territory, and possessing a degree of independent authority within that area. Theoretically, the state is the corporate being or legal person which, under the above conditions, is acknowledged as the supreme source of law. The distinguishing attributes of such a state are sovereignty with respect to its own affairs and independence with respect to other states. The political state is thus to be distinguished from the territory over which it is sovereign and from the government through which it operates. Political scientists generally agree that the state is constituted by the will of the people who share in the making of laws and the choosing of officials.

Modern political thought recognizes that both sovereignty and independence are never actually absolute, but always relative, even in the greatest states. Further it is conceded that a sovereign state may delegate certain functions without impairing its sovereignty. These two considerations justify the application of the word "state" to

the constituent units of a larger state, where, as in Australia and in the United States, a federal form of government exists. By virtue of the constitutions of these countries, the individual commonwealths share in the sovereignty of the general state while retaining, in the spheres of their peculiar interests, a measure of sovereignty.

State Judiciary. In the United States, each state maintains its own judiciary, comprising courts of merely local jurisdiction in counties and municipalities and courts of various higher grades. Each state system includes courts of general civil and criminal jurisdiction as well as special tribunals for certain types of cases. Some of the courts exercise both judicial and large administrative functions, the practice varying rather widely in different states.

The law administered in a state court is, in general, that of the state statutes, the Federal statutes, and the English common law adapted to American conditions. In Louisiana, the civil law is based upon French and Spanish precedent. A state court is bound by the Federal Constitution and by the constitution of its particular state. Some judges and justices are appointed, but the general state practice is to elect judges. In state courts of general jurisdiction a jury is employed, a unanimous verdict being usually necessary.

The following summary represents, in general, the organization of the state judicial systems:

1. *The lowest grade of courts,*—(1) the justice's court, held by a justice of the peace, who may be a town, township, or county officer; (2) municipal courts (under various names) in towns and cities, presided over by judges or magistrates, who are officers of the municipality; (3) the county court, held by a judge who is, in some states, a county official and, in others, a state officer.

2. *The intermediate grade of tribunals,*—known variously as district, superior, and circuit courts. The judges of these courts are state officers, elected or appointed, either for the entire state or for particular districts. Under whatever name, these are the principal trial courts of the state. In a few states, another court, sometimes called "supreme court," either takes the place of the circuit court or is intermediate between that court and the highest tribunal of the state.

3. *The highest tribunal, or court of last resort.*—In most of the states, this is called the supreme court; in others, it is termed court of appeals, court of errors, or court of errors and appeals. The opinions rendered by this court are held to be of binding authority in the lower courts of the state.

Special Classes of Courts. (1) *Court of Probate.*—Generally, this name is applied to the court having charge of the probate of wills, the administration of estates, and the supervision of orphans. In New York and New Jersey, it is called the surrogate's court. In Georgia, the old ecclesiastical term "ordinary" is applied to the judge of probate. In Pennsylvania, Delaware. and Maryland, the name "orphans' court" is used.

(2) *Court of Common Pleas.*—Originally, in England the term "common pleas" applied to cases arising between subjects, as distinguished from those to which the crown was a party. In the United States, the name has been retained in New Jersey, Pennsylvania, Delaware, Ohio, Missouri, and Kentucky for courts whose jurisdiction is limited to a district made up of one or more counties.

(3) *Court of Quarter Sessions.*—This name arose originally from the quarterly sessions held by English justices of the peace. In Pennsylvania, a court under this title has some important administrative functions.

(4) *Juvenile Courts.*—These are sometimes called children's courts. Their jurisdiction includes cases of dependent, neglected, and delinquent children. Generally, the upper age limit is 16 years, although in some states it is 18 or even 21 years. These courts endeavor to correct the conditions responsible for a child's wrongdoing rather than merely to determine punishment for an offense.

State Rights. The field of independent action enjoyed by states in the American Union. The discussion of the exact character and scope of these rights has played a great rôle in the constitutional history of the United States. The framers of American government were divided between those who sought a strong national government and those who jealously defended state rights. Among the most extreme of state claims, advocated after the formation of the Union, were the doctrine of "nullification," or the right of a state to nullify national legislation which it might judge inconsistent with the Constitution, and the doctrine of "secession," or the right of a state to withdraw at will from the Union. These doctrines were lost by the issue of the Civil War.

Growth of Federal Power. There has been a natural and almost inevitable tendency for the Federal power to grow. This growth has been contributed to by decisions of the supreme court of the United States, which during long and important periods of its history was disposed to interpret the Constitution in favor of Federal jurisdiction. But the main factor operating to enhance the power and importance of the national government has been the extraordinary integration of the American people as a nation, the predominance of their national loyalty and interest over state and local feeling, and the binding together of all sections of the country by economic attachments.

This economic unity, which was happily provided for by the Constitution when it assured freedom of trade between the states, has made necessary an ever-increasing authority of the Federal government over economic affairs. This is particularly evident in its control of interstate commerce, which has been defined by the Supreme Court to include intrastate action merely affecting commerce in almost any degree.

The 14th amendment extended the authority of the national government to the protection of life, liberty, and property, while the 15th amendment, enfranchising the colored race, and the 19th amendment, guaranteeing political rights to women, largely removed from the decision of the states the determination of the rights and privileges of citizenship. The 16th amendment, conferring upon Congress the right to levy taxes upon incomes, diverted a source of public revenue of increasing interest to state taxation. In recent years, Congress has passed a number of appropriations providing for the distribution of sums of money among the states in aid of education, agriculture, and other projects, provided additional appropriations are made by the states and a national policy is followed in their expenditure. These sums of money, appropriated out of the national treasury for objects belonging exclusively to state government, have had an undoubted tendency to bring further under Federal control matters constitutionally reserved to the state.

Present Status. The continuous growth of the power, service, and repute of the national government, while highly gratifying from many standpoints, has undoubtedly an unfortunate effect upon the vitality and activity of state governments, and prejudices popular interest in their conduct. Thus the question of state rights emerges anew in American politics, and it is now representative, not of the aims of those who desire to deny or to reduce the necessary powers of the Federal government, but rather of the purpose of those who feel the necessity of preserving an actual distinction between the scope of the national government and the functions which properly and necessarily, under a federal system, are reserved for state governments. Interest in state rights in this sense is no longer represented by party lines. While the Democratic party originally was a strong "state rights" party, since the Civil War, Democratic presidents, hardly less than Republican, have by their actions augmented the national control. And some of the American statesmen who are today most sensitive to the need of preserving state rights are members of the Republican party.

Statute of Limitations. A law which prescribes a definite limit of time within which a legal right or remedy must be prosecuted by action in the courts, or thereafter be barred. Such laws are intended to protect the individual against stale demands, when, from lapse of time, death of witnesses, failure of memory, or other causes, the true situation may be obscured.

The periods prescribed by statutes of limitations vary in the different states, and differ in the same state for different kinds of claims. Under the laws of most states, rights in regard to property must be asserted within twenty years or be barred by the continuous "adverse occupation" of another.

Steam Roller. A term descriptive of the manner in which the faction in control of a political convention or legislative body may force through a slate or program previously determined upon. The use of the "steam roller" at the Republican convention of 1912, through the control of the national committee, gave the term and the procedure wide publicity.

Steering Committee. An informal committee in each house of Congress, dominated by the leading members of the majority party in the body, which determines the order in which business shall be taken up by the house. In the House of Representatives, the steering committee is practically synonymous with the committee on rules, which is vested with the power of reporting a special rule placing any important measure ahead of ordinary business.

Still Hunt. A secret campaign on behalf of or against a candidate for office. The phrase is used also to designate secret propaganda against a particular candidate.

Straight Ticket. See *Scratching*.

Straw Vote. An informal, unofficial canvass of political votes, taken prior to a regular election, for the purpose of determining the direction of political sentiment.

Syndicalism (*sĭn'dĭ-kăl-ĭz'm*). A labor organization originating in France which has for its aim the destruction of the state and the organization of society by trade-unions ("syndicats"). The organization upon which syndicalists depended for the accomplishment of their aims was the

"General Confederation of Labor" (*Confédération Générale du Travail*, commonly known as the "C. G. T."), founded in 1895 and attaining a final form of organization in 1902. This was a national association of revolutionary labor unions.

THE SYNDICALIST PROGRAM. Syndicalism differs from socialism and the extreme form of socialism, or bolshevism, in that it entirely repudiates the state. In this respect it approaches anarchism. Syndicalism, however, adopts as a central principle the distinctive socialist doctrine of the "class war." It has developed certain tactics and policies which have been adopted also by bolshevism. These tactics completely repudiate political activity or "parliamentary action" and substitute for them methods of industrial warfare, commonly called in America "direct action." These include the boycott, sabotage, and the "general strike." By the general strike is meant such an organization of industrial labor, embracing all crafts and industries, and so general and synchronous a cessation of labor therein as to completely paralyze industrial production and the supply to communities of the necessities of life. By so general a strike, syndicalists aim to throw existing society into chaos, to overthrow the state, and to gain social power for the federation of industrial workers.

Syndicalism came into prominence in the great French railway strike of 1910, which was broken by the action of the French minister Briand, who arrested the strike committee, mobilized the army reserves, including strikers, and replaced striking workingmen by soldiers under military discipline.

As stated above, syndicalism differs fundamentally from socialism and communism, with which it is frequently confused, by the fact that these latter social programs have in mind the realization of a "great state" devoted not only to political objects, but also to owning and operating all productive capital, controlling the activities of all individuals, and thereby becoming the common employer.

INFLUENCE OF SYNDICALISM. World War I and the repressive action of the French government upon all revolutionary movements shattered French syndicalism, and, since the rise of bolshevism in Russia, revolutionary elements have turned toward the program of this socialist party rather than toward the program of syndicalism. The influence of its theory, however, is traceable in other movements than the above, and particularly in "guild socialism," which, like syndicalism, views with alarm that exaggeration of the state which pure socialism would produce, and proposes to organize society in a decentralized form around industrial groups or "guilds."

Tariff. The word is used in America in two senses: (1) It is used to describe any schedule of charges, but particularly rates for the shipment of goods by public-service corporations, or other services afforded the public. Such charges at the present day are usually controlled by the government, either through the interstate commerce commission or by public utility commissions in the states. (2) Tariff is used to designate the scale of customs duties imposed upon foreign products entering home territory. It is in this second sense that the term "the tariff" is used politically in the United States.

Broadly speaking, a tariff is devised either "for revenue only" or "for the protection of home industry." As a means of raising revenue, tariffs have been employed by nearly all governments. This form of taxation has the advantage of being "indirect." It falls upon the people in higher prices paid for such articles as they purchase and thus avoids the difficulty and the irritation arising from the collection of "direct taxes"; it is relatively easy of administration, being collected at the frontiers at certain designated points where customhouses are established; and, in the case of a highly industrial or commercial people, it may be productive of a very great revenue.

PROTECTION. A "protective tariff" rests upon different principles. It is devised not solely nor mainly for revenue, but rather as a means of building up national manufactures or other forms of production in the face of foreign competition which, if given free entry, would endanger the native industry. It is upon this basis that American tariffs have been largely framed. The effect of such tariffs is undoubtedly to bring profit to certain interests and to certain sections of the country at the cost of the purchasing public generally. Defenders of the protective system, however, urge the desirability of developing all reasonably profitable industries and forms of products as a means of bringing a nation to its highest point of economic development and of making it self-sufficient, particularly in the event of war and blockade.

RECIPROCAL TRADE AGREEMENTS. These are pacts, authorized by Congress in 1934, between the United States and other nations for the reciprocal lowering of tariffs. The policy is based on the belief that protective tariffs adopted by many nations against one another's goods have the effect of choking trade and production to the disadvantage of all. These agreements extend to other nations the advantages given each nation signing a pact, but with the proviso that these other nations may be barred from the benefits if they refuse to enter into similar agreements after a reasonable time or if they discriminate against American products. The adoption of this policy in America came at a time when trade barriers had been raised to unprecedented heights and when commerce and industry throughout most of the world had dropped to less than half their volume of five years earlier.

FREE TRADE. Opponents of protection, or "free traders," take the broad view that the modern world is, or should be, organized internationally for industrial production. Under such a system each country would produce mainly those things which, because of its resources or its situation, it can produce most cheaply, and would purchase elsewhere, in the cheapest markets of the world, other necessities and luxuries of life. Thereby, it is argued, we should avoid the waste through excessive cost to the consumer, occasioned by an artificially stimulated domestic production of goods that can be acquired abroad more cheaply.

Taxation. Taxes are general compulsory contributions of wealth, levied upon natural persons or upon corporations, to defray the expenses of government. They are inseparable from all governments and are a part of the price paid for protection and for the advantage of society. While taxes are general in the sense that they affect all persons and all classes of society, there have been and are many exceptions to their universal payment. These take the form of "exemptions." In European feudal society, the nobility, the clergy, and their properties were untaxed. Even in democratic countries, like the United States, it is usual to exempt from the payment of certain direct taxes persons possessing small incomes or small properties. Ex-soldiers or veterans of certain wars are frequently granted tax exemptions. Taxation may take the form of money payments or of personal services, such as labor on roads or public works.

KINDS OF TAXES. Taxes may be classified as "direct" and "indirect." The former embrace contributions of money or service directly furnished by those upon whom the tax is imposed. Indirect taxes take the forms of customs duties, "excises," or taxes on articles of luxury or common use, and government monopolies, where the state reserves the exclusive sale of a product at a price advantageous to the public revenue. The most common and lucrative form of direct tax is the property tax, which may be levied upon land or "real property" or upon movables or "personal property."

Other forms of indirect imposts are the sales tax and the payroll tax. The most widely used form of the sales tax in America is that imposed on gasoline. The principal argument advanced against sales taxes is that they fall with disproportionate weight on those least able to bear them. The payroll tax has been used to pay the costs of social security legislation, on the ground that insurance against uncertainty in employment is properly accounted as one of the costs of doing business.

Two forms of taxation which have become extremely important are "inheritance taxes," or "death dues," and "income taxes." Under the former tax, the state appropriates a certain proportion of the estate of a deceased person before the balance is distributed among his heirs. In the second form of taxation, the state regularly collects a proportion of the gross or the net income of a person or of a corporation. Not only are these last two types of taxes, in certain cases, made to yield large revenues, but they have a definite social effect in limiting the accumulation of private fortunes and their succession. Usually the amount appropriated by the government increases rapidly with the size of the fortune or income.

INCOME TAX IN AMERICA. In 1894, the Congress of the United States imposed a federal income tax, which was declared unconstitutional by the Supreme Court in 1895. This decision led to the adoption of the 16th Amendment, empowering Congress to lay and to collect taxes on income without apportionment among the several states. The federal income tax became an immensely valuable resource to the government. The states also have made use of this source of income.

As applied to corporations, the income tax has been used as an instrument of governmental policy. By making the rate higher for larger incomes, an advantage is given to smaller corporations. Similarly, by assessing a higher rate when larger proportions of earning are retained instead of being distributed in profits, money is forced out to individuals where, if the individuals are wealthy, it may be taxed at the very high rates imposed on large personal incomes. This device is aimed against concentration of wealth.

Tax Dodging. The practice of avoiding payment of taxes. A means frequently employed by people of wealth is that of acquiring a nominal or actual residence in a small town or village where taxes are light, or in another state,

in order to avoid the heavy personal property taxes which they would bear if legal residents of the city in which their interests are actually centered.

Tenure of Office Act. The United States Constitution, while making the president the general appointive authority to positions in the federal service, is silent upon the method of removing such officers. In 1789, during the session of the first Congress, the question of whether the president could remove such officers without the consent of the Senate was raised, and at that time, after some discussion, it was recognized that the power of removal rested in the president.

In 1867, however, Congress passed, over the president's veto, an act known as the "Tenure of Office act," which aimed to prevent the president from removing federal officials without the consent of the Senate. President Johnson disregarded this law, holding it to be unconstitutional, and his conduct was the basis for charges of impeachment.

In 1869, the act was in part repealed, and the remaining provisions of the act were repealed in 1887. A decision by the Supreme Court in 1926 supported the president's right to remove appointees of executive departments when the term of appointment is not fixed by law. Removal of a member of an independent agency, however, appointed for a definite number of years was ruled beyond the president's authority by a decision in 1934.

Theocracy (*thē-ŏk'rà-sĭ*). A form of government in which God is viewed as the supreme civil ruler, and in which government is conducted by a priesthood claiming the representation of Deity and enforcing laws supposed to be divinely inspired.

Third Parties. The American system of government, as well as the British, is considered to function properly only where two great parties divide the political field and contend for the possession of the government. So-called "third" parties have often been formed, but in the United States they have had brief existence. They have from time to time served the purpose of organizing support for new or neglected policies to the point where they have been adopted by either or both of the major parties. The Prohibition party, the Populist party, and the Progressive party are examples of this result.

Third Term. Before the adoption of the 22d Amendment to the United States Constitution in 1951, there was no limitation to the number of terms a president could serve. The example set by Washington, who refused to consider a third term, established a precedent which was followed until it was shattered by President Franklin D. Roosevelt, who was elected to a third tĕrm in 1940, and to a fourth term in 1944.

In 1880, a strong movement within the Republican party sought the nomination of Grant for a third term, but was unsuccessful. Again, in 1912, the question of the third term arose when Theodore Roosevelt sought nomination after having occupied the presidency 7½ years. In this case the third term would have been separated from previous executive position by an interval of four years. This fact, in many minds, removed possibilities of danger.

Other nations which have adopted the institution of the presidency have in some cases limited eligibility to a single term. In Mexico, where the right to indefinite re-election was secured by President Diaz, the principle of "no re-election" has been made constitutional both for national and for state executives.

Three-Mile Limit. By general recognition, it has become a principle of international law that the territorial sovereignty of a nation bordering on the high seas is not limited to its shores at low tide, but extends out into the seas a distance of three marine miles. This understanding among nations permits a country to enforce its domestic laws within this limit and has proved of much practical value. The distance of three miles was settled upon at a time when this was regarded as the extreme possible range of guns. Owing to the difficulty experienced by the United States in preventing the landing of contraband liquor from the sea, the British government consented to an exercise of American jurisdiction over British shipping up to a distance of twelve miles from the coast. Although the three-mile limit is still being used in parts of the world, in recent years numerous nations, including the United States, have adopted a 200-mile limit.

Town Meeting. An assemblage of all of the voters or qualified inhabitants of a town, held annually for the purpose of electing administrative officials of the town and of passing upon all important legislative matters.

The town meeting, since colonial times, has been the chief organ of local government in New England. It is an example of direct popular government in its simplest form. When the community, however, reaches the proportions of a city, some form of representative government becomes essential, and many towns in New England have abandoned the town form of government.

Treason. The Constitution of the United States provides: "Treason against the United States shall consist only in levying war against them, or in adherence to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act or on confession in open court. The Congress shall have power to declare the punishment of treason, but no attainder of treason shall work corruption of blood or forfeiture except during the life of the person attainted." (Art. III, Sec. 3).

The purpose of these provisions was to provide a clear definition of this crime in place of the broad and elastic interpretation given to it by English courts and to limit punishment to the actual offender.

Treason may be committed against any state of the Union as well as against the United States. The limitations given above are not limitations upon the states, but most state constitutions contain similar provisions.

Treaty-Making Power. This power is quite universally recognized as an executive function. The president of the United States is vested with the power "by and with the advice and consent of the Senate to make treaties, provided two-thirds of the senators present concur." Negotiations leading to the making of a treaty are carried on exclusively by the president, usually acting through the State Department. Congress has invariably refused to receive foreign missions or representatives and has not even a constitutional right of being informed of the progress of negotiations. As a means of assuring the Senate's ratification, it is the preferable practice for the president to appoint members of the Senate upon commissions of negotiation, particularly peace negotiations.

Trial by Jury. The United States Constitution, 6th Amendment, provides: "In all criminal prosecutions the accused shall enjoy the right to a speedy and public trial by an impartial jury of the state and district wherein the crime shall have been committed." The 7th Amendment provides: "In suits of common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law." Likewise in all the state constitutions, there are provisions which insure trial by jury to those accused of crime and to litigants in civil actions, the right being generally limited to those cases in which trial by jury was assured at the time of the adoption of the particular constitution.

Trial by jury, unless otherwise constitutionally provided, means trial by a jury of twelve persons of the jurisdiction in which the case is tried, who are impartial and who have been chosen by impartial officials, and who are sworn to render a verdict according to the evidence and the law.

An essential feature of "trial by jury" is that the jury shall proceed under the guidance and instructions of the court, and that only questions of fact upon which there can be a reasonable difference of opinion shall be submitted to the jury. It is the duty of the presiding judge to "instruct the jury" as to its verdict. He may even take the case out of the jury's hands if the situation so demands.

Alongside the common law courts of England, which decided criminal and civil controversies with the aid of a jury, there grew up a system of "equity" jurisprudence, under which cases were determined by the chancellor as the representative of the king. In this field of equity jurisprudence, the right to trial by jury did not exist at the time of the adoption of the United States Constitution and the early state constitutions, and therefore is not guaranteed by them.

Civil and criminal cases of minor importance, by custom, are tried before justices with summary power, and in these cases the right of trial by jury does not exist unless expressly provided by law.

A grand jury is a body of 12 to 23 members which, in some jurisdictions must bring in a formal indictment before certain types of cases can be tried. It may act on information of prosecutor, witnesses, or its own members.

Ultra Vires (*ŭl'trà vī'rēz*). A Latin phrase meaning "beyond powers." It is used of an act beyond the authority vested in a public or private corporation exercising functions limited by law or charter.

Unicameral System. See *Bicameral System.*

Unit Rule. A practice followed at nominating conventions which permits the majority of a state delegation to decide how the delegates shall vote as a unit.

Unwritten Law. General principles of justice, which, together with the customary rules of law and of procedure of courts in medieval England, formed the basis of the unwritten or "common law" of England and of those countries that have inherited their law from England. The term is used in contrast to the "written" or statute law passed by the legal legislative authority. The unwritten law exists in a vast and ever growing body of judicial decisions in which its principles are expounded and applied by courts.

In a popular and sensational sense, "unwritten law" is used to express a moral justification for illegal acts, like

murder under excessive provocation. This so-called "unwritten law" is entirely without legal foundation, but juries in the United States have been influenced by its appeal to find for the accused in direct disregard of positive law.

Veto. Executive refusal to approve an action, particularly a legislative enactment. The word "veto" comes from the Roman practice of conferring the same power upon two magistrates, as on the consuls, either of whom by pronouncing the word *veto*, "I forbid," could negative the action of the other.

In the constitutional development of Europe, a veto power was assumed to reside in the king, particularly as against acts of Parliament. As late as the Stuart kings of England, the monarch retained and frequently exercised the power of refusing assent to acts of Parliament, and royal assent is still nominally given. Every statute takes the form of an act of the king, but the assumption of the king's powers by ministers and the responsibility of these ministers to the House of Commons have made the royal veto an anachronism. The last employment of the royal dissent was by Queen Anne in 1707. Today, a British monarch's refusal to subscribe to a statute of Parliament would be an act of revolution.

Veto Power. The American colonists were thoroughly familiar with the veto power, as this right was exercised constantly in the name of the king by their colonial governors. It was thus adopted by them in the Constitution of the United States as a presidential power. In bestowing it upon the president, the framers of the Constitution intended to set up another of those "checks and balances" which the political theory of the time recommended. It was also felt that a president's veto was needed to protect the executive department against usurpation by the legislative. The veto, however, was not made absolute; it can be overridden by a two-thirds vote of each house of Congress.

In the early decades of the American republic, the veto power was sparingly employed by the president. It was very boldly used, however, by President Jackson, and its exercise in recent decades has become common. President Cleveland used it unsparingly to defeat private bills. The disposition today is to associate the president with congressional legislation and to hold him, as well as Congress, responsible for all legislation which he may not disapprove.

The veto power has also been finally conferred upon every state governor except in North Carolina, and, in a number of states, it may extend to items of a bill and particularly to items in an appropriation bill.

In American city charters which bestow legislative power upon a council and executive power upon a mayor, the veto power is usually given to the mayor.

The veto power has been provided generally in the constitutions of those countries adopting presidential government. Sometimes it takes the form of a "suspensive veto," whereby the executive simply returns the bill to the legislature for reconsideration. In states where the initiative and the process of framing laws is in the hands of the executive, the veto power has no significance.

The term is often, though inaccurately, applied to the procedure in the Security council of the United Nations, where any one of the five permanent members is able to defeat a motion by voting against it.

Visa (*vē'zä*; *vē-zä'*). See *Passport*.

Voting. Voting is the formal expression of opinion or of choice, either upon some question submitted for decision or upon the election of officers or representatives. In a democratic government or society, voting is almost an essential institution for determining the will of the majority. It may, however, be expressed in a variety of ways: orally, or *viva voce*, either with or without a "call of the roll"; by some physical manifestation, as, by rising, or by a "show of hands"; by ballot.

Early forms of balloting consisted in dropping a small object, like a pellet or ball, into urns, or other receptacles; hence the word "ballot," meaning "a little ball." Balls of different colors, as white and black balls, have been and still are used to express affirmative or negative decision; from this practice comes the expression, "to blackball." For political purposes at the present time, however, a ballot is a written or printed expression of the will or choice of the voter.

In political elections, practically all countries have experienced difficulty in providing balloting machinery that would be simple, inexpensive, and protected from fraud or intimidation. In the United States, voting systems have been greatly abused down to recent decades. Agitation for an official secret ballot commenced about 1882. In 1888, Massachusetts adopted a form of ballot called, from its place of origin, the "Australian ballot," the principle of which rapidly spread until today nearly every state has some such system. In most states voting machines, in which the voter records his choice by pressing a lever, have come into use. The main objects are secrecy, to protect the voter from intimidation and to discourage bribery, and a fair count and return of the vote.

Similar forms of voting have now been adopted by many European countries.

Short Ballot. One of the mistakes of the democratic theory in America has been to make elective too many nonpolitical administrative offices. This results in cumbering ballots with so large a number of offices and names as to make a judicious selection impossible to the ordinary voter. A wise reaction has occurred in favor of the appointment of administrative officials so that the voters' responsibility is limited to the selection of a few important executive and legislative representatives. This is the principle of the "short ballot."

Plural Voting. The democratic theory would seem clearly to limit one man to one vote in any election, on the principle that all persons and all classes should have identical political weight in all decisions. In Prussia, before World War I a system of "three-class voting" existed, whereby electors were divided into three categories, each of which represented equal taxpaying power. Each class then chose one-third of the representation. This system is imitated in Japan. The democratic movement in Germany, which triumphed at the conclusion of World War I, has abolished this system in that country. In Belgium, before World War I, a system of plural voting prevailed, whereby two and even three votes were given to citizens possessing unusual qualifications. This system was abolished in the electoral reformation after World War I. In Great Britain, under certain circumstances, a voter may vote for two parliamentary representatives, one in the district of residence, the other in some other district in which he may have exceptional qualifications.

Compulsory Voting. The lethargy or indifference of the electorate is one of the most serious problems of democracy. Certain countries have endeavored to solve it by obliging qualified electors to vote, under penalties for abstaining. Compulsory voting was introduced into Belgium by constitutional amendment in 1893, the penalty for the first offense being a reprimand from the justice of the peace or a fine of from one to three francs, and, for subsequent delinquency, a penalty amounting to as much as the deprivation of the right of suffrage for ten years.

Absentee Voting. State legislatures in the United States have repeatedly made provisions whereby citizens absent from the state on military duty have had their votes taken at important elections. Certain American states allow all voters absent from their town or election district, but within the state, to cast their votes in another electoral district. Vermont passed such a law in 1896; Kansas in 1901 provided that railway employees might vote by mail, and in 1911 extended this privilege to all voters. Among other states with similar laws are North Dakota, South Dakota, Nebraska, Minnesota, Missouri, Colorado, Iowa, Michigan, Montana, Oregon, Wisconsin, Washington, Wyoming, Virginia, Utah. In Sweden, a husband may deliver his wife's vote in a closed envelope, and a wife that of her husband. In other elections in the same country, soldiers, absent seamen and fishermen, employees of railways, ports, customs, and pilot service, may vote by mail. Absentee voting is legalized also in Australia, New Zealand, Norway, and in some of the Swiss cantons.

War. War is an act of violence inflicted by one people or nation upon another people or nation, in order to compel compliance with its will.

Coercive measures that fall short of actual employment of force and the infliction of damage and destruction are not war. Recognized "measures short of war" include: severance of diplomatic relations; "embargo," or the detention of ships in port; "reprisals," which may take the form of the seizure of property or the death of the citizens of another state, and even such extreme steps as the occupation of enemy territory and "pacific blockade," or the stoppage of communication with a country by arrest of shipping. Such measures as these last may become actual warfare, although war has neither been declared nor been legally recognized. Among such cases may be cited the German blockade of Venezuela in 1902 and the American occupation of Vera Cruz, Mexico, in 1914.

War may be carried on upon the land, upon the sea, or upon both elements at the same time. From the warfare of Rome upon Carthage to World War II, superior sea power, or the domination of ocean communication by one belligerent, has been demonstrated to be a factor of immense influence upon the prospects of victory. The actual decision, however, must almost of necessity be gained by the victory of land forces and by the destruction of the enemy's power of armed resistance. With the great advance in aerial warfare, "control of the air," or the power to deny another enemy the employment of aircraft, is recognized as a paramount and perhaps a decisive factor in future wars.

It has long been the continued effort of supporters of international law and of humanitarian principles to con-

fine the practices of warfare to the armed forces of the belligerents. But modern warfare is waged upon a scale so much vaster and with so much greater intensity of resolution that the undoubted theory of present day warfare is that it is a contest between the entire populations and resources of the belligerent nations. The object of warfare today, therefore, is not only the destruction or capture of the enemy's armed forces, but also the embarrassment, the injury, and the depression of the enemy's civil population to such a degree that its will for resistance may be broken.

Declaration of War. War dates from the first act of hostility and may precede a formal declaration. The declaration of war itself may take various forms, including formal advice to the enemy government, a general proclamation of hostilities, or the declaration of a blockade of the enemy's territory.

The decision to end peaceful negotiation and to embark upon war is without doubt the most weighty and the most terrible responsibility that a government may have. In the past, the power of decision usually has been vested in the sovereign or in the executive branch of government. By the constitution of the former German Empire, the final decision rested with the kaiser. But more and more the development of the sense of responsibility in governments has tended to place this decision in a representative legislative body. This is specifically done by the Constitution of the United States, which recognizes Congress alone as capable of making a declaration of war. In spite of this constitutional provision, however, it must be recognized that the issue of peace and of war rests more with the president than with Congress. The president, by his conduct of negotiations, by the movement or employment of the armed forces, practically may commit the nation to war in advance of the authorization of Congress. Congress alone, nevertheless, has the power to furnish the vast supplies of money and men whereby a war of magnitude can be waged. A similar situation exists in the British government, where, although the war-declaring power is a crown prerogative exercised by the ministry, no British government today would embark upon war without the assured or expressed support of the House of Commons. This was sufficiently indicated in the last days of August 1914, preceding Great Britain's entrance into World War I.

The confiding, to the executive branch of government, of so momentous a responsibility as the issue of war or peace springs from the necessity of prompt decision and the instant employment of war measures. The opening actions of modern warfare have an extreme, if not a decisive, influence upon the outcome. These actions embrace rapid mobilization of troops, the seizure of strategic or defensible positions, the sudden and, if possible, unexpected destruction of the enemy's forces, and the seizure of the "initiative." It is for these reasons that such an extreme proposal as the requirement of a national plebiscite, in place of an executive or legislative decision, might delay a nation in the employment of its military strength until the enemy had gained insuperable advantages.

Restrictions on Warfare. Since the time of the great jurist Grotius, the legal thought of the modern world has been consistently occupied with efforts to abate the severities and inhumanities of warfare. Numerous authoritative writings and repeated conferences of European nations have been directed to this end. Particularly was this the object sought in the agreements reached at the second Hague Conference. The practices of armies and navies in World War I, however, disregarded most of these conventions. Extreme supporters of vehement warfare have laid stress upon the expediency and justification of severity as the policy most likely to shorten war and to bring an enemy to the acceptance of peace. It must be clearly seen, however, that ruthless measures may weaken more than they may aid the nation employing them. This they do by the sacrifice of neutral sympathy, by the weakening of the moral quality of the people employing them, and by the strengthening of the passion of resistance in the people against whom they are employed.

Right to Make War. Justification for warfare is a matter of wide differences of view which must be weighed from moral rather than from legal considerations, although international law writers have attempted to define acts legally warranting hostility, which are termed "casus belli." Opinion varies from the view that war may be engaged in only as an unavoidable act of national self-defense, to the view that war is but a "continuation of politics," a reenforcement to the aims of statesmen and diplomatists where these efforts are unduly obstructed or delayed. This was the view advocated by extreme partisans of war, both political and military, in Germany before World War I.

"The right to wage war" has long been recognized as one of the essential attributes of a sovereign state. In certain cases, however, this right has been surrendered by treaty, as in the case of Switzerland and of Belgium before 1914. Japan renounced war by its constitution of 1946.

Warfare, however it must be deplored, appears to spring not more from the ignoble passions of a people than from its noble qualities—from its national pride and high spirit; from its quickness to feel injustice and wrong; and from a moral preference for the sufferings and losses of warfare rather than for the acceptance of injustice and oppression.

The prospects of future avoidance of war, as a practical matter, would seem to lie less in the establishment of leagues and treaty engagements than in the general diffusion of sympathy and understanding between nations, and in the cultivation, particularly among the greater peoples, of patience, restraint, and spirit of concession. Such a spirit has the strongest possible support from considerations of the devastation entailed in atomic warfare, which constitutes what has been called a balance of terror.

Welfare State. A state which by its social legislation shows its concern for the well being of the people in such matters as health, old age pensions, unemployment insurance, child welfare, etc., and gives direction and support to such programs.

Whip. *See Party Whip.*

Whitewash. The exoneration of officials accused of misconduct, without a sincere attempt by the investigation committee to uncover the real facts or to punish the offenders.

Wirepulling. A term used to describe the secret means whereby political bosses control legislation and political appointments.

Woman Suffrage. During the colonial period, women in Massachusetts and Virginia who possessed the necessary property qualifications were at times permitted to vote. However, under all of the state constitutions adopted during the Revolution, voting was restricted to male citizens, except in New Jersey, where women voted until an act of the legislature in 1807 expressly limited the suffrage to "white male citizens."

The woman's suffrage movement in the United States began about the middle of the 19th century. In 1848 the state of New York passed a law, soon adopted by other states, which permitted married women to hold and to dispose of property. This was the beginning of a series of laws which ultimately extended full civil rights to women.

In 1869 were formed both the National Woman's Suffrage Association and the American Woman's Suffrage Association. The latter sought suffrage for women through amendments to state constitutions, while the National Woman's Suffrage Association sought it through Federal amendment. In 1890 the two associations merged into the National American Woman's Suffrage Association.

The first victory of the American suffragists was in 1869 in the territory of Wyoming, where women were granted full and equal suffrage. The territory of Utah followed in 1870. In 1890, when Wyoming was admitted as a state, its state constitution provided woman suffrage, and Wyoming thereby became the first state in which equal political rights were extended to women. The suffrage was granted to women in Colorado in 1893; in Idaho and Utah in 1896; in Washington in 1910; in California in 1911; in Kansas, Oregon, and Arizona in 1912; in Alaska in 1913; in Nevada and Montana in 1914; in New York in 1917; and in Michigan, South Dakota, and Oklahoma in 1918. In 1917 women obtained the right to vote in primaries in Arkansas; in 1918 they obtained a similar right in Texas. In certain other states, the right to vote for president was granted.

Finally, in the fall of 1918, a resolution to amend the Constitution by providing that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or any state on account of sex" was passed by the House of Representatives by the necessary two-thirds vote. It was twice defeated in the Senate and was not passed until the special session called by President Wilson in 1919. The amendment was ratified by the necessary 36 states in 1920.

Suffrage was extended to women in Finland in 1906, and in Norway and Denmark in 1907. By 1936, it had been granted in more than two-thirds of all countries in the world. In some of these countries, however, women were under legal disabilities in holding public office. Enfranchisement of women appears to follow with the evolution of society from a feudal and agricultural stage to the industrial stage.

Zoning Ordinances. Ordinances passed in American cities, dividing the municipal territory into zones or districts of several kinds, as residence zones, business zones, industrial zones, unrestricted zones, and definitely limiting the uses to which property in these districts may be devoted. The purpose of these ordinances is to insure health, beauty, and convenience in the geographical development of the city. Doubt has existed as to the power of legislatures or their agents, the municipalities, to enact such laws; but recent decisions of the courts have upheld them as within the police power of the state.

REVIEW QUESTIONS

Distinguish between the art and the science of politics 727
Criticize the 18th century idea that savage peoples enjoyed an ideal freedom 727
Compare Aristotle's idea of a state with that of Plato. What, in Aristotle's view, is the object of the state? 727
Discuss the contributions made to political philosophy by Machiavelli and Bodin. Through what ideas did John Locke influence the American colonists? 727
Point out some political movements produced by World War I 728
State some of the political problems of the present day. Differentiate politics from history 728

THE UNITED STATES

Name two intercolonial assemblies, with the date of each, previous to the assembly which declared American independence . . . . .
What general reason for the issuance of the Declaration of Independence is set forth in 729
the first paragraph of the document? . . . 729
From what source are governments said to derive their just powers? 729
Enumerate ten facts set forth in the declaration as proof of the purpose of the king of Great Britain to establish a tyranny in America 729
By what title are the signers of the declaration described? By what authority do they affirm the declaration to be issued? 729–730
Whose name headed the list of signers of the declaration? 730
Enumerate the defects of the Continental Congress as an agency of government. When were the Articles of Confederation adopted by Congress? When were they finally ratified? 730
For what kind of united government did the Articles of Confederation provide? Of what body did the central government consist? . 730
By what title did the members of the Congress refer to themselves in the heading of the Articles of Confederation? 730
In what words is the confederation described in Article III? What purposes of the union are enumerated? 730
To how many delegates in the confederation Congress was each state entitled? to how many votes? 731
How many delegates were elected to the Constitutional Convention of 1787? How many attended the sessions? Characterize the membership of this body 733
Enumerate the six institutions which were given original form by the Constitution. For what two characteristics of form is the Constitution remarkable? Quote Gladstone's judgment about the Constitution 733
Upon what date was the Constitution signed? Name the nine states that first ratified it . . 733
What methods of amendment are provided by the Constitution? How have amendments actually been proposed and adopted? . . 733
For what reason were the first ten amendments proposed and adopted together? . . 734
Give the dates upon which the several amendments became effective 734
Who, according to the preamble of the Constitution, established that frame of government? Enumerate the purposes of the Constitution, as stated in the preamble. . . . 734
What article of the Constitution of the United States provides for the taking of the decennial census? 739
Of what two houses does Congress consist? State the length of the term of each Congress. Upon what date do the regular sessions of Congress begin? By whom are special sessions called? 739
How many United States senators are elected from each state? By whom are they elected? State the length of a senator's term. Who are eligible for election to the Senate? . . . 739
Outline the powers of the Senate 739
By whom are members of the House of Representatives elected? for what term? Who is eligible for election to the House? . . . 739
Outline the powers of the House of Representatives 739
Summarize the method of electing the president of the United States. State the eligibility requirements of the office 739
Enumerate the powers and duties of the president 739
Who elects the vice president when the state electors fail to make a choice? What is the salary of the vice president? State the order of succession to office, in case of the removal, death, resignation, or inability of the president 739
Enumerate the executive departments of the government. Summarize the particular field of each. What is the salary of cabinet members? 739
By whom are judges of United States courts appointed? What is their term of office? . . 740
How many members constitute the supreme court? Summarize the field of the supreme court's original and appellate jurisdiction. What especial function, outside the court, attaches to the chief justice? 740
Over what classes of cases do the inferior courts have jurisdiction? What judges are competent to sit in a circuit court of appeals? . 740
How many United States district courts are there? State the jurisdiction of the United States court of claims 740
Point out how the Senate is associated with the president in the direction of foreign relations. What customs and practices indicate the extent of the president's power in foreign affairs? Indicate the Senate's peculiar function with respect to war and peace. What body only can declare war? 740
Compare the importance of membership in the Senate with that of membership in the House. 740
State the fields to which the legislative powers of Congress are limited by the Constitution. 740
Enumerate the acts which are at present forbidden to Congress by the Constitution. In what field of legislation may Congress overstep these prohibitions? 741
Tell three ways in which Congressional committees influence legislation 742
How does a bill become an act? Is the President's approval necessary for a concurrent resolution of Congress? For a public resolution? 741–742
From what powers and practices does the president derive his great influence over legislation? 742
What is the function of the cabinet? 743
Discuss the question of the disability of a president. Is the president limited as to the place where he may officially act? 743
Point out the appointive powers of the president that make him the real head of the national administration. Indicate the extent of his power through the army and the navy and through the department of justice. 742–743
Discuss the authority of the president in respect to war and peace. Discuss the growth of the power of the presidency and the maintenance of the integrity of the office by those who have occupied it 742–743
Enumerate the functions of the secretary of state with respect to treaties; presidential elections; laws and resolutions of Congress. 743

Is the secretary of defense a civil or a military officer? Summarize his duties 744

What secretaries of war served under two successive presidents? Name the secretaries of war who later became presidents. Under what president was Jefferson Davis secretary of war? 744

Summarize the duties of the secretary of the treasury in respect to government finance; in respect to other functions of government. 745

Outline the duties of the attorney-general. Upon what questions must he give his own opinion? What president appointed five different attorneys-general? 745

Outline the duties of the secretary of the interior in relation to parks; to conservation of natural resources 746

When was the first secretary of this department appointed? Under what president was Carl Schurz secretary of the interior? . . 746

What is the title of the head of the Federal postal service? Indicate the scope of his powers of appointment. Outline his other functions 748

Name the postmaster-general who served under three presidents 748

Outline the duties of the secretary of agriculture. By what president was the first secretary of agriculture appointed? 746

State the general field of action of the secretary of commerce. Enumerate some of his specific duties 747

What are the general duties of the secretary of labor? Summarize his special powers and duties. When was the first secretary of labor appointed? 747

Enumerate the functions of the secretary of the navy. Is he a civil or a military officer? 744

In what year was the first secretary of the navy appointed? 744

What president appointed six different secretaries of the navy? 744

Discuss the Department of Defense 744

Enumerate the functions of the civil service commission 749

What Federal body assigns wave frequencies for radio broadcasting stations? When was this body established? 749

Describe two duties with which the Federal power commission is charged. What act does it aid in administering? 749

State the composition of the Federal trade commission. What are the duties of this body? What is its chief purpose? 749

By what acts have the powers of the interstate commerce commission been defined and enlarged? How many members constitute the commission? Indicate the range of the powers of this body 749

When was the Smithsonian institution created? Who made it possible? For what purposes was it created? 750

State the purposes of the veterans administration 750

When were the United States supreme court and district courts organized? From what year does the present system of circuit courts date? What is the function of the circuit courts? 750

From what provision of the Constitution do the United States courts derive their power to pass upon the constitutionality of laws? 750

What proportion of the supreme court must agree to a decision? Explain "concurring decision"; "dissenting opinion." Name the chief justices of the United States. . . 751

American State Government

What two classes of government are recognized by the Constitution? What authority stands back of these governments? 752

Point out the influences that have tended toward the extension of the field of the Federal government's activity 752

Outline the field of state administration. Discuss the relation of the Federal and state governments in the protection of public order 752

What states of the Union never held the status of territories? 752

State the first step in admitting a territory to statehood 752–753

Enumerate the existing methods of amending state constitutions 753

For what purpose is the constitutional convention generally used? By what authority may a constitutional convention be called? 753

In what states is amendment by popular initiative now authorized? Point out some restrictions attending the use of this procedure 753

Summarize the history of popular ratification of state constitutions 753

Indicate the extent of the state legislative field under the Federal Constitution. Why have numerous state constitutions limited the powers of legislatures? Discuss the movement for greater legislative freedom 753–754

Describe the general form of legislative body adopted in American states. By what names are the body and its parts known? 754

Discuss the qualifications for membership in the legislative houses 754

Who is usually the presiding officer of a state senate? 754

Point out several ways in which state legislatures are overburdened and embarrassed by too great a volume of legislative projects . 754

Discuss the use of the referendum and the initiative in state legislation. Indicate by statistics the extent to which these plans have been used 754–755

State the qualifications required for election as governor 755

Account for the small degree of authority attached to the office of governor. What is the relation of the "short ballot" to gubernatorial power? Estimate the present status of the governor's office in American politics. 755

Discuss the effect of the veto power in gubernatorial influence upon legislation. What are "administrative measures" in state legislation? 755

Explain the nature and the extent of the governor's pardoning power in various states 755–756

Describe the several important types of administration in vogue in the states. Criticize the system of boards and commissions. 756

Name some states which have recently reorganized their administrations. What are the functions of the California board of control? 756

In what states are civil service laws now in force? Point out the usual powers of a civil service commission 756

What is the recall? Summarize the provisions governing its use in various states 757

Point out the two purposes served by local government. Indicate some types of public service in which the interests of the state and those of the locality overlap 757

Indicate the proportion of the population of the United States which is classed as "urban." Name the three chief plans of American city government 757
In what city was the commission plan first used? Name several important cities now governed by commissions. Describe the essential features of the plan. Indicate its merits 757
Name some important cities which operate the "city manager" plan of government. Point out the function of the manager 757
Describe the government of Puerto Rico . . 758
How is the governor of Puerto Rico chosen? 758
What representation have Puerto Rico and the other dependencies at Washington? . . . 758
How are the Virgin Islands governed? . . . 758
Under what authority is the Panama Canal Zone administered? 758
How was American Samoa obtained? How is it governed? 758
What smaller Pacific islands does the United States own? Why are they significant? What islands are held in common with Great Britain? What as trustees? 758
What state has the greatest number of members in its house of representatives? 759
In what states are the judges of the highest state court chosen by the governor and legislature? in what states, by the legislature? 760

WORLD GOVERNMENTS

State a generally recognized test of "sovereignty." Discuss membership in the United Nations as a test of sovereignty 765
How did the change from hunting to agriculture produce a revolution in governmental forms? 765
How did the Middle Ages lead to a repetition of the evolution from absolutism to democracy? 765
What governmental ideas does the world owe to the Greek city states? 765
Give two reasons why many so-called democracies are not democratic. Can a monarchy be a democracy? 765
Show by examples the use of Greek and Roman terms in describing forms of government 765
Illustrate by numbers the proliferation of new nations after World War II 765
What form of government does Afghanistan have? 766
What role did Albania play in the ideological rift between Russia and China? . . . 766
Illustrate one-party government by pointing to procedures in Algeria 766
By what body is Andorra governed? What two individuals act as its suzerains? . . . 766
What role did Portugal play in the political history of Angola? How has black nationalism affected Angola? 766
Summarize the political history of Argentina down to 1852. Compare the general provisions of the Argentine constitution with those of the United States constitution. What historic difference led to giving larger powers to the federal government? 766
Of what states and territories is Australia composed? What officer and legislative bodies constitute the federal government? Point out a likeness between the Australian government and that of the United States . . 767

Austria—Cameroon

Following World War I Austria-Hungary was dismembered into what countries? After the liberation of Austria in 1945, Austria was occupied by what countries until 1955? Explain the structure of Austria's federal government 767
What country rules the Azores? What influence has Communism had in the political history of the Azores? 767
In what year did the Bahamas become independent? Name the more powerful positions in that nation 767
How did Bahrain gain independence from Britain? What method is used to fill the head of state position? 767
Bangladesh formerly was the eastern province of what country? In the Bangladesh constitution what provision applies only to women? 767
Describe Britain's political relationship with Barbados. How many chambers does the parliament of Barbados have? 767
Summarize the king's role in the government of Belgium. How is the provincial government structured? Name the two distinct groups of people living in Belgium . . . 768
Britain's colony of Belize is claimed by what other country? Can the premier or cabinet of Belize be removed before the completion of a term? 768
Before independence what country controlled Benin? What was Benin's former name? In what year did it become independent? . 768
What form of government rules in Bhutan? What is the most prominent religion in Bhutan? 768
From what country did Bolivia gain independence? Describe the political situation in Bolivia 768
In Botswana who is the most powerful government official? Does Botswana have any political ties with Britain? 768
How is Brazil's president elected? What is the minimum voting age? What power does Brazil's federal government have over state finances? 769
What is Bulgaria's highest organ of the state? What is the Fatherland Front? How many chambers comprise the national assembly? . 769
What influence has the military had in Burma? Is Burma a member of the Commonwealth? 769
In 1919 Burundi became part of what UN territory? Discuss Burundi's one-party system. How extensive is the party's control? 770
Summarize Cambodia's political history following French rule 770
Outline the constitution of Cameroon. From what provinces was this nation formed? . 770

Canada—China

During the early colonial period of Canada, what was Canada's relationship with the British government? What is the legal basis of Canada's constitution? What is the importance of the 1931 Westminster statute to the British North America Act? Is the queen of Britain also the queen of Canada? 770
In what manner is the British crown represented in Canada? The federal parliament of Canada consists of how many chambers? What are the eligibility requirements for members of parliament? Describe the powers of the provincial governments . . 771
Cape Verde was a colony of what country for 500 years? How was the transition to self-rule conducted? 771
The Central African Empire became independent of France in what year? Is it still a member of the French Community? . . . 771
Chad was a part of what French colony until 1960? What are Chad's ties with France? Explain the military's authority in Chad and the status of Chad's constitution . . . 771
In what year did Chile become independent? When was the first constitution of Chile adopted? Describe the power structure under that constitution. What changes have occurred since then? 772

Describe the former imperial system of government in China. What factors brought about its fall? Characterize the government that arose in 1912 and the one established in 1928 772
Trace the steps that led to the division between Communist China and Nationalist China. What was the territorial division? . 772
Describe the Cultural Revolution in China and the period following it. Outline the powers of the National People's Congress. How are its members chosen? Where does the real power lie in China? 772
State one similarity and basic difference between the two governments of the two Chinas. Contrast their claims of territorial authority 773

Colombia—France

What countries comprised Great Colombia? Summarize the political history of Colombia to 1886. Name some of the more recent provisions to the 1886 constitution 773
Explain how power is divided between the two political parties in Colombia. Describe the functions of the house of representatives and those of the senate. Discuss the departmental governments 773
When did the Comoro Islands become a French colony? When did the islands become a republic? What is the major federal government body, and the major local government body? 773
When was the Congo granted independence from France? How long are the terms of national assembly members? How are they chosen? Describe the process by which a bill becomes law 773
Discuss the voting requirements in Costa Rica. How are the president and vice president elected? Legislative power in Costa Rica is divided among how many bodies? Explain the judicial system 774
By what treaty did Spain relinquish sovereignty over Cuba? After Batista, what kind of government and society did Castro try to impose? What were his methods? As a result of the 1976 constitution, what is the major political party in Cuba? . . . 774
Discuss the operations of Cuba's national assembly and the ways legislation can be introduced to the assembly. Explain the policies of the federal government toward the press and other forms of communication 774
Cyprus was a colony of what country? What are the two major divisions reflected in the constitution. How does this affect the executive and legislative branches of government. What were the events leading up to the formation of a Turkish Cypriot federated state in Northern Cyprus? 774
Summarize the political history of Czechoslovakia until 1960. Describe the reform movement of 1968 and the eventual outcome. Outline the structure of the federal government 775
What are the three Scandinavian countries? What type of government rules Denmark? In what year were women first permitted to succeed to the throne? 775
Describe the relation between the Dominican Republic and Haiti. How long is the president's term? 775
The territorial boundaries of Ecuador are in dispute—discuss this. Describe the role the military has played in Ecuador's recent history 775
What countries formed the United Arab Republic? Egypt's 1964 constitution provided for a national assembly. What was one of the provisions concerning the members. How is the president of Egypt chosen? 776
What are Eire's ties with Britain? Outline the requirements for members of the legislative branch of the federal government. What are the requirements for president? How does the council of state participate in government? In the absence of the president, what procedure is followed? 776
When did Equatorial Guinea gain independence? What country ruled Equatorial Guinea? 776
Following World War II what former colony of Italy was added to Ethiopia? Why? What is the Dergue? 776
How many years was Fiji a possession or dependency of Britain? What is the make-up of the federal government? 777
The parliament of Finland contains how many members? How can a bill become law over the veto of the president? Who supervises the enforcement of law in court? 777
When was the Fifth Republic of France established? Give the dates of the preceding four republics. State some reasons for the political instability of France as compared to Britain 777
Describe the office of prefect in France; the role of the general council; the manner of government in the communes; the power of mayors 777
Indicate the powers granted to the president of France under the Fifth Republic. Describe the procedures by which a bill becomes law and by which a treaty is ratified. In 1958 what options were given to members of the French Community? . . . 778

Gabon—Israel

When did Gabon become a republic? How is the president elected? 778
Outline the federal government of Gambia 779
Describe the upper house under the first German constitution and under the Weimar constitution. Discuss the federal government and the totalitarian state under Hitler's control 779
Summarize the steps that resulted in Germany being divided into two countries after World War II. Compare the legislative bodies of East Germany and West Germany 779
What are the functions of the supreme military council in Ghana? 780
What is the status of the monarch in Great Britain? Give the titles of three of Great Britain's chief ministers. Name the two chambers of the British parliament. Describe the system of local government 781
List the powers of the president of Greece. According to the 1975 constitution, what is the formal name of Greece? 782
The government of Grenada is patterned after the government of what country? How is the head of state chosen? 782
Explain the literacy regulation in regard to voting in Guatemala. Who is the departmental head in each of Guatemala's 22 departments? 782
Guinea was a colony of what country? What individual or body has sole and unlimited power to legislate? 782
Explain Portugal's role in the history of Guinea-Bissau 782
What are Guyana's ties with Britain? . . . 782
How many years is the term of Haiti's president? Describe the president's legislative authority 783
In what year did Honduras revolt against Spain? 783
What influence did Russia have on Hungary following World War II? Discuss the Hungarian government's policy concerning ownership of property 783
How may the term of Iceland's president be cut short by political action? 783

What position in India has the authority to form government policy and establish an administrative cabinet? Who was the first person to occupy this position? 784
Name the six organs of the Indonesian government 784
What is the former name of Iran? Iran's modern history was a record of decay until what discovery? 784
Summarize Iraq's political history since World War I. What form of government exists in Iraq? 785
Israel's government is patterned after the government of what country? How are the president, prime minister, and Knesset chosen? 785

Italy—Morocco

How is the president of Italy elected? By whom, other than legislators, may bills be introduced into parliament? What subject is excluded from possible amendments to the Italian constitution? 786
In the Ivory Coast how do bills become law? Who succeeds the president in the event of the president's death? 787
When did Jamaica become independent? How is the prime minister chosen? 787
Describe the role of the emperor and the elder statesmen under the Japanese constitution prior to World War II. Specify two striking innovations in the Japanese constitution as adopted after World War II 787
Detail several powers of the king of Jordan 788
How are the nonelected members of Kenya's house of representatives chosen? 788
Compare the procedure of electing government officials in North Korea with the procedure in South Korea 788
How many members comprise the national assembly of Kuwait? What is the title of Kuwait's ruler? 788
Who controls the government of Laos? 788
How does the Lebanese constitution seek to keep in check the rivalry between religious sects? 788
Lesotho was the protectorate of what country? What was its former name? 788
The constitution of Liberia is modeled on that of what country? Name two requirements for voting 788
What is the major ruling body in Libya? 789
Can women succeed to the throne of Liechtenstein? 789
Can women succeed to the throne of Luxembourg? How is the constitution amended? 789
What form of government exists in Malagasy? 789
How many major political parties are there in Malawi? What was Malawi's name while a British protectorate? 789
Who is the supreme head of Malaysia? What is the official religion? 790
When did Mali become independent? 790
Who is the head of state in Malta? Who is the head of government? 790
The president of Mauritania must be of what religion? Who can initiate bills in the legislature? 790
How many chambers comprise the legislature of Mauritius? 790
Characterize the Mexican constitution of 1917. What are the qualifications for voting? In what way is land ownership restricted? 790
What is unusual about the ownership of land and public revenue in Monaco? 791
What are Mongolia's ties with the U.S.S.R.? 791
From 1912 to 1956 Morocco was divided into two protectorates of what two nations? What kind of federal government rules in Morocco? 791

Netherlands—Rumania

Describe the system of electing members to the states general of the Netherlands. Outline the authority of a municipal corporation's mayor 792
Nicaragua's president is allowed to serve for how many terms? 793
Describe the federal government of Niger 793
How influential is Nigeria's army in government affairs? 793
Can a bill become law in Norway without the king's approval? How did women's right to vote differ from that of men from 1901 to 1910? 793
What is the basis of Oman's judicial system? Who appoints the judges? 793
Before independence in 1947 Pakistan was under the colonial rule of what country? By what means did Bangladesh become a nation? 793
What role did the United States play in the independence of Panama? 794
Papua New Guinea is governed by an elected assembly of how many members? 794
Summarize the political history of Paraguay preceding the 1967 constitution. Describe how the president is chosen and the authority of the president 794
Peru became an independent republic in what year? 794
The Philippines became a dependency of the United States after what war? How much influence does the United States have in the government of the Philippines? 795
Who interprets Poland's laws and has treaty-making powers? 795
What important event occurred in Portugal in April 1976? 795
Characterize the legislature of Qatar 795
Discuss the relationship between Great Britain and Rhodesia 796
Rumania had what type of government until 1947? Rumania has a foreign policy of alliance with what major country? 796

Russia—Sweden

Describe the system of government in the former imperial Russia. Review the course taken by the Russian Revolution. What is the relationship of the Communist party to the Russian government. Name five rights guaranteed to individuals under the Russian constitution; three duties that are demanded 796
How are Rwanda's president and vice president chosen? 798
El Salvador became an independent republic in 1839 when what federation was dissolved? 798
What authority has the Communist party in San Marino's government? 798
Until 1975 Sao Tome and Principe was under the rule of what country? 798
What is the common law of Saudi Arabia? 798
Is Senegal a member of the French Community? 798
When did Seychelles become independent? 798
In Sierra Leone who is commander of the armed forces? 798
Singapore's parliament has how many chambers? 798
Somali Republic was formed in 1960 from territories formerly under the control of what countries? 798
South Africa is comprised of what areas? 798

How was the Spanish kingdom formed? With what date does the modern constitutional history of Spain begin? 799
What type of government was set up as a result of the Spanish Civil War of 1936–1939? 799
How is the membership of the Cortes chosen?. 799
Indicate the extent of the powers of the king of Sweden. To whom are the ministers responsible? Discuss democratic trends in the government since World War I 800

Switzerland—Zambia

State the outstanding facts about the government of Switzerland 800
Discuss the relation of the Swiss cantons to the central government. Why is the Swiss title of "Confederacy" a misnomer?. . . . 800
Point out the use of referendum and initiative in Switzerland 800
Describe the functions of the Swiss commission executive. How is the Swiss president chosen? What are his functions?. 801
How was Syria's union with Egypt dissolved?. 801
Of what two parts is Tanzania formed? . . . 801
When did Thailand cease to be an unlimited autocracy? 801
How are members of the Senate of Trinidad and Tobago selected? 802
What religious qualification must the president of Tunisia meet? 802
Review the historical events that led up to the establishment of a republic in Turkey. . . 802
What educational qualification must the president of Turkey meet? What is the extent of his veto power over legislation? 802
How is the president of Venezuela elected? . 803
Explain the historical reason for the division of Vietnam into two parts 803
Trace the course of Yugoslavia from its establishment as an independent republic in 1918 to its establishment as a people's republic in 1946 804
Who selects the vice president of Zambia?. . 804

POLITICAL TERMS AND INSTITUTIONS

Define absolutism; admiralty; air zone . . . 805
Indicate two uses of the word allegiance. . . 805
Distinguish between amnesty and pardon . . 805
Enumerate some important examples of international arbitration. 805
Name some states that have passed compulsory arbitration laws 805
Discuss the applications of the term aristocracy; of autocracy 805
State the rules adopted at The Hague in 1899, governing the recognition of belligerent rights 805
What is a bicameral system of legislature? Name an American state having a unicameral legislature. 805
To what English document is the name Bill of Rights applied?. State the rights and liberties of Englishmen that are summarized in this document. Compare this declaration with later similar state papers 805–806
Define the political term bloc. Point out its application in America 806
What is a blockade? State the conditions governing a valid blockade 806
Trace the derivation of the term bolshevism. State the relation of the theory of bolshevism to the doctrines of Karl Marx; its relation to other nations 806
What was the bonus? 806
Describe the "boss" system 807
Define the term budget. Discuss the use of the budget system in England and in the United States 807
State the chief dangers in a bureaucracy. . . 807
Outline the chief features of cabinet government. What other names are applied to this system? 807
Explain the political use of the word caucus. Trace the development of the census as a governmental activity 807
Discuss the granting of charters by the government in England and in the United States . 807
Define citizenship. Show how a person may be a citizen of two different countries at the same time 808
What is the legal status of a city? Discuss the extent of municipal authority, especially in Great Britain and the United States . . . 808
Point out some changes in the relations of American state governments to cities . . . 808
Define city planning. Point out some defects in the American "checkerboard" plan of laying out cities. What is a civic center? . 808
Contrast civil rights with natural rights. Discuss the growth of modern rights. Point out the provisions for the maintenance of civil liberty in America 808–809
State the applications of the term "civil service." From what two theories did public service in the United States long suffer? Describe the general provisions of the Civil Service act of 1883 809
Discuss the parliamentary device known as the closure rule. Describe the procedure known as filibustering 809
Explain the theory of commission government. Distinguish the character of a commission from that of a board 809
What is the meaning of the term "common law"? 809
Describe the chief features of communism. .809–810
Illustrate the meaning of the phrase "concert of powers" 810
Define conscription. Where did compulsory military training originate? When has the United States used conscription? 810
State the purposes of conservation 810
What three parts are necessary to a theoretically complete constitution? Indicate the extent to which the example of the United States in adopting a written constitution has been followed by other states 810
Outline the duties of a consul 810
Define the term contraband. Indicate the effect of the World Wars upon the extent of the list of contraband goods 810
Discuss the American practice of holding political conventions. Summarize the work of a national party convention 810–811
Recite the American's Creed 811
Distinguish between *de facto* and *de jure* government. 811
Differentiate the fundamental meaning of democracy from that of monarchy and that of aristocracy. Discuss the present meaning of democracy 811
Define diplomacy. Enumerate the grades of diplomatic representatives. To what countries does the United States accredit embassies? Explain the uses of the words "embassy" and "legation" 811
To what immunities and privileges is a diplomatic representative entitled? 811
Explain, with examples, the practice of direct legislation 811–812

Explain the purpose of the framers of the Constitution in providing for presidential electors. Outline the procedure of the electors. Contrast their present function with that intended by the Constitution 812
Distinguish two kinds of embargo 812
What is the right of eminent domain? State a limitation upon this right in the United States. For what purposes is the right most frequently exercised? 812
State some limitations that have been placed upon the practice of extradition. Outline the procedure followed in extradition among the states of the Union 812
Discuss extraterritoriality 812–813
Define federalism. Illustrate the nature of this form of government by comparison with other forms 813
What is a franchise tax? 813
Define the franking privilege 813
Describe the free city as it has existed at various periods of history 813
Point out the recent change in political and economic thought with reference to freedom of contract 813
Indicate the provisions of the United States Constitution with respect to freedom of religion and freedom of speech. Point out some limitations of the right of free speech 813–814
Are there any free ports in the United States? If so, where? 814
Define the political term fusion; gerrymander. 814
Discuss the practice of government ownership. 814
What is a writ of habeas corpus? 814
When was the first Hague Peace Conference held? Summarize the results of the conference 814
By whom was the second Hague Peace Conference called? Discuss the acts of this conference 814–815
Outline the history of the establishment and the work of the Hague Tribunal 815
Explain the meanings of the term "home rule" 815
Explain impeachment. State the earliest instance of the process. Outline the procedure in cases of impeachment in the United States. 815
What is the object of the International Labor Organization? 815
What is meant by the phrase "initiative of laws"? 816
Define the term "writ of injunction." Discuss the use of this writ in the United States. . 816
State the nature of intervention. Outline the circumstances under which intervention has been justified 816–817
Tell three ways in which modern lobby practitioners seek to influence legislation . . . 817
Describe the origin and indicate the value of the marine corps 817
Explain the significance of the term "martial law," as used in the United States 817
Define merit system 817
Outline the possible uses of military government under the constitutional system of the United States. Give an illustration of such uses 818
What is meant by the term "military law?" By whom is military law enforced? 818
Discuss modern limitations of monarchy . . 818
Give one reason for the rise of monopoly, two benefits attributed to it, and three dangers inherent in it 818
Outline the history of the application of the Monroe Doctrine 819
Discuss the policy of municipal ownership of public utilities 819
Enumerate the four types of armies relied upon by various states for national defense. Discuss the comparative values of these forces. Analyze the composition of the army of the United States 819–820
Define naturalization. Outline the procedure required for American naturalization 820
Define neutrality. Point out the essential obligations of a state which desires to maintain neutrality 820
Why is oligarchy so universally condemned? . 820
Discuss the significance of the open door policy in international affairs 821
Define pacifism and point out the chief principles of the doctrine 821
In what officials, in the United States, is the pardoning power vested? 821
Explain the phrase *persona non grata* 822
Indicate the nature and the development of the police power 822
Characterize the various forms of primary elections 822
Enumerate several privileges and immunities of citizens of the United States. 822–823
Outline the history of prohibition legislation in the United States 823
Define propaganda 823
State the purpose of the election plans known as proportional representation. Describe the principal plans that are in use 823
Summarize the early history of the public lands policy in the United States. Describe the main features of the policy since 1862 . . 823–824
Explain the meaning of the phrase "recall of judicial decisions" 824
Distinguish between the optional and the obligatory referendum. Discuss the use of the referendum in various countries. . . . 824
Discuss the various historical conceptions of a republic. State an arbitrary general definition of this form of government. Show the modern tendency of republics to supersede monarchies 825
Point out the meanings of the terms "right" and "left" in legislative bodies. 825
Define sabotage. Trace its origin. 825
Discuss the signification of the term self-determination. State some difficulties in the application of the principle 825–826
State the theory upon which the principle of the single tax rests 826
Explain the theory of the state known as the social contract 826
Give a general definition of socialism. What is the distinctive feature of Marxian socialism? 826
Are economic crises looked on by Socialists as advantageous to their cause or disadvantageous? 826
Discuss the rise and progress of modern social legislation 827
Define the term soviet 827
Enumerate the state courts of the lowest grade; of the intermediate grade. What is the purpose of the juvenile court? 828
Summarize the early history of the state rights controversy. Outline the growth of Federal power. What is the present status of the state rights question? 828
What is the purpose of a statute of limitations? 828
Explain the following: steam roller; steering committee; straw vote 828
Explain the program of syndicalism . . . 828–829
State two meanings of the word tariff. What are reciprocal trade agreements? 829
Describe several modern kinds and forms of taxes 829
Explain the phrase "three-mile limit" . . . 829
What is a town meeting? 829
State the general meaning of the expression "trial by jury"; "unwritten law" 829
Outline the principle of the short ballot . . . 831
With whom does the power of declaring war rest in the United States? 832
Review the history of the woman suffrage movement in the United States 832

BIBLIOGRAPHY

Reflecting the wide range of material dealing with politics and government, the following list contains, in addition to encyclopedias and yearbooks, a variety of specific works useful to the student and the general reader. Books in the latter group cover different phases of organic and constitutional law, political philosophy, the evolution of constitutions and party systems, the machinery of government, practical politics.

ENCYCLOPEDIAS, YEARBOOKS, AND OTHER REFERENCE WORKS

Adams, G. B. and Stephens, H. M.—Select Documents of English Constitutional History. *Macmillan*

American Statesman Series (biographies). *Houghton*

Book of the States (annual). *Council of State Governments*

Burchfield, L.—Student's Guide to Materials in Political Science . . . . . *Holt*

Picture Guide: Students at Work in a Library—New Library Buildings—Contemporary Campus Architecture in the U.S.

New Libraries Contribute to Public Education. Top: Scottsdale Public Library Civic and Cultural Center, Scottsdale, Arizona. Lower left: Madison Public Library, Madison, New Jersey. Lower right: San Lorenzo Public Library, Alameda County Library System, California. Each of these recent and varied examples of functional architecture expresses contemporary community-service approaches to continuing public needs for information, education, research, and recreation.

Contemporary Campus Architecture. Top left: The United States Air Force Academy Chapel, Colorado Springs, Colorado—Architects: Skidmore, Owings and Merrill. Top right: The book tower of the library at Emory University, Atlanta, Georgia—essential to library science courses. Bottom: Crown Hall, Illinois Institute of Technology, Chicago, Illinois—Designed by architect Ludwig Mies van der Rohe, who died in 1969. (*Photographs on this page and overleaf courtesy of the particular institutions.*)

Education

"Knowledge is of two kinds. We know a subject ourselves or we know where we can find information upon it."—James Boswell, in *The Life of Samuel Johnson*

Primitive peoples and societies in earlier stages of civilization had no institution such as the school we know today. They did, indeed, give their youth preparation for adult life, but this training was through imitation of the older members of the family or tribe; the process of education was in no way separated from the life of the group.

Specialized Education. The first demand for a definite type of education, which appeared as civilization advanced and as the earlier type of education became inadequate, was the demand for religious training. Primitive tribes often organized rituals at the time the boy became a candidate for admission to adult society, and through these rites initiated him into the secrets of tribal religion. Special education of the girls was never as fully organized as the education of boys.

Secular Education. As civilization became more complex, special bodies of knowledge accumulated, which were not religious in character and could not be transmitted through simple imitation.

Throughout the history of educational systems, the transmission of literary material has been one of the main functions of the school. The result was that the content of the course of study in schools of all grades was largely literary. Training for industry and instruction in the ordinary practices of social life were, even in modern times, left largely to the family or given lower priority in the educational structure. Then, in the 1970s came a movement for greater emphasis on career/vocational education. At the same time, increasing attention was paid to the education of those with learning/behavioral disabilities.

Education and the Government. What originated as the practice of the privileged has gradually come to be the general practice of the community. Schools have been brought together under teachers trained to handle large groups and thus relieve parents of the necessity of individual training or private tutoring.

All modern nations have educational laws of more or less complete scope, and enforce these laws so as to provide, with a high measure of certainty, that no child shall lack training in the fundamentals necessary for social interchange.

For example, it is unacceptable in society that any considerable number of persons be unable to read. Reading is necessary so that there may be ready communication between a government and its citizens.

Likewise, modern society cannot be carried on unless its members can count and perform accurately the simpler calculations needed for commerce and trade. Society has provided by law that every child attend organized school long enough so that it should be possible to learn the basics of common subjects such as reading, writing, and arithmetic.

In the United States, the goals of the schools, what is taught and how, and who teaches it, are all decided by two types of forces: lawfully constituted authorities and informal groups of citizens exercising independent power and influence.

Education is a constitutional responsibility of all fifty states. It is one of the powers reserved for the states, rather than for the federal government. Yet education is not mentioned in the Constitution of the United States. No record can be found in the debates of the Constitutional Convention that education was ever considered to be of little more than remote concern to the federal government at the time the Constitution was written.

Yet by the year 1820, of the twenty-three states in existence, thirteen had constitutional provisions and seventeen had provisions by statute regarding public education. All but two of the states had either constitutional or statutory provisions, and nine of the early states had both. Today, all states of the union have firm mandates in regard to public education. The general note is set in the Illinois constitution: "The General Assembly shall provide a thorough and efficient system of free schools, whereby all children of this State may receive a good common school education."

With the early spread of public education, provisions for compulsory attendance and public tax support of the schools became important. Beginning with Massachusetts in 1852 and including Mississippi in 1918, all forty-eight states had enacted laws for compulsory education. Similarly, Alaska and Hawaii have enacted such provisions.

In 1812 New York was the first of the states to pass a law establishing public schools. In 1820 New Jersey provided for the education of poor children and for all children in 1838. In 1821 Delaware and Ohio authorized taxes for public education; Illinois followed suit in 1825. Then, by about 1850, every state in the North had established publicly supported education. Thus, step by step, tax support and compulsory attendance became essential in the establishment of public schools.

The laws of the states in general came to require the establishment and support of "common schools." Yet there remained areas of doubt that common schools included secondary schools. In 1874 the Michigan Supreme Court noted:

> We content ourselves with the statement that neither in our state policy, in our constitutions, or in our laws, do we find the primary school districts restricted in the branches of knowledge which their officers may cause to be taught, or the grade of instruction that may be given, if their voters consent in regular form to bear the expense and raise the taxes for the purpose.

The keynotes of the passage lie in the concepts of freedom of the school districts and consensus of the voters in favor of such taxes. Decisions of this kind established that local boards of education had the authority to establish schools, to set their levels of instruction, and to apply state minimum standards to all schools. The decisions also authorized the levying of taxes to support schools, even if state law did not provide specifically for such schools and levels of instruction.

Two types of levies are commonly used. Bond issues in considerable amounts provide capital to purchase land, to build new schools, to make additions to existing buildings, or to purchase major plant equipment. Operating levies, when lesser expenditures are called for within a given period, provide funds for administration and for the salaries (or salary increases), as well as the retirement programs and fringe benefits of teachers, secretaries, and other workers. Operating levies also cover funds needed for maintenance and repair of schools, as well as purchase of textbooks, learning-center materials and equipment, and other continuing needs.

Nonpublic School Relations. As the public school system expanded, there came the concept that nonpublic schools should be eliminated. At length, this question brought a United States Supreme Court decision. In the Oregon case of 1925, the court affirmed that the statute requiring all children to attend public schools only was unconstitutional. That is, the state holds the right to examine and regulate private schools in a reasonable manner, but it does not have the right to abolish such nonpublic schools.

There arose further the idea that the states may exercise certain supports of nonpublic schools. The

principle is contained in the "child benefit" theory. In 1947 the United States Supreme Court stated that the use of tax money for transportation of any school pupil, public or private, was constitutional. As time went on, many states have provided textbooks, audiovisual equipment, and other materials and services to nonpublic schools under legal sanctions. Thus, it can be stated that while schools may not require pupils to take part in religious observances on the basis of separation of church and state, yet some cooperation between religious groups and the public schools is constitutional.

Continuing Issues. In 1955 the Brown Case brought the decision that racially segregated schools were unconstitutional. This ended the long-held doctrine of "separate but equal" schools. The decision did not bring an immediate end to the problems of civil-rights issues in the schools. In the years that followed, busing, or the transportation of white and nonwhite children across district boundaries, was used to promote social integration.

With growing inflation in the 1970s, a further problem was the financial support of schools. The issue was: What part of the public resources—federal, state, and local—should be allotted to education. The chief concern lay in the sources, control, and allocation of such funds. The forthcoming responses were threefold. First came a flow of federal revenues, depending chiefly on individual and corporate income taxes, and increasingly, but not totally, directed to areas of dense population and low income. There were also changes in the allotment of state funds, dependent largely on income and sales taxes. The principle underlying both changes was that of "revenue sharing" on the basis of need. At local levels—to cover increased costs of buildings, school supplies, and teacher salaries—real estate taxes were increased across the United States. Since such taxes are subject to public approval in most cases, there came a reluctance to approve such measures by vote. The results were that in some parts of the nation deficit financing, or the use of funds borrowed against future revenues, had to be undertaken for the operation of public schools. By 1977 the issue came to a head in Cleveland, Ohio, when local courts approved the closing of schools for lack of funds. In response, federal courts ordered that the schools remain open and that deficit financing be applied.

The social and individual need for adequate education is clear. The relative powers of the levels of government—federal, state, and local—are generally resolved and are also subject to legal recourse, ending with the United States Supreme Court. Equality of education remains a problem, as does the issue of financial support and its control. The solutions remain to be found in the two houses of the national Congress, the fifty legislatures of the states, and the varying structures of hundreds of thousands of local communities and school districts.

U.S. and European Schools. A study of the schools of the United States will bring out characteristics that most Americans do not know to be unique. It is thus proper to note the major fact that the schools of the United States have factors that could appear only in a democratic system.

European Universities. The schools of Europe began to take on their present forms during the late medieval period. In Spain the Moors had established a system that included universities as early as A.D. 715. These served as models for other universities established in other parts of Europe.

The first of such institutions was a law school at Bologna, Italy, chartered in 1158. The scholar Irnerius had succeeded in translating the codes of law of the northern Italian cities. He lectured on these codes to students who came from all parts of Europe to prepare to maintain their places as members of the ruling classes of their nations. This was the beginning of the medieval universities.

Preparatory Schools. In connection with these centers of learning, there grew up in the provinces preparatory schools, where boys who would attend the universities learned the Latin language, necessary to understand the university lectures. These lower schools had to get their teachers from the only educated class then in existence, the clergy. The Church, therefore, exercised an overall influence throughout the educational scheme.

The preparatory schools, like the universities, received only boys from the upper classes of society. They were schools for the aristocracy, not for the common people.

Common Schools. Schools for the ordinary working people were not organized until much later. Such schools grew up in part under the control of the Church. There were so-called cathedral schools, gradually organized at the great centers of population, within the cathedrals themselves, for the training of boys who were to serve in the choir. The boys assigned to such service were the sons of the common families. They had to be trained in reading and music to take part in the Church services. A little arithmetic was often added to other areas of teaching. The catechism was also taught. Indeed, the clergy commonly taught the catechism to all the people in connection with Church services. Catechism classes became the nuclei of schools that were in no way related to the higher schools.

These religious schools were gradually extended, and at the time of the Reformation, the Protestant leaders saw the importance of religious instruction for all children. They therefore organized schools in connection with their religious centers.

Dual European System. From the sources described, it can be seen why Europe developed two distinct types of schools—one for the aristocracy and one for the ordinary people.

Early Division in America. American practice differed from that of Europe. Originally, the schools of the United States were so organized that there was a common school for the ordinary people and a higher school for the clergy. When Harvard College was first organized in Massachusetts, it was intended for the upper classes, that is, for boys who were to enter the ministry. A preparatory school in connection with Harvard was organized as the Boston Latin School. Like Harvard, it was not meant for the ordinary boys (or girls) of Boston, but was a classical school of preparation for college.

The common schools that grew up in Massachusetts and the other colonies were semireligious institutions with much simpler courses than that of the Latin school. The reading matter used in the common schools consisted of the catechism and extracts from the Bible. As described in the early statutes of the Massachusetts colony, the schools were for training children in reading, so that they might come into direct contact with the Scriptures.

The dual system thus begun in early colonial days broke down in time, because the small groups of migrating families that moved westward toward the frontier were becoming more and more democratic in spirit and organization and did not want to maintain the distinctions common in Europe between privileged classes and the ordinary people. The villages that grew up in Massachusetts and Connecticut maintained only a single school. In part, this was due to the direct expense of maintaining schools. In larger measure, it came about through the absence of distinction between the different classes of people in these small communities.

After the single school system was begun in the villages of the colonies, it was natural that it should expand along lines that would maintain the democratic character of the original organization. When the communities prospered and were able to set up higher schools, these also were open to all classes of young people. The result has been that in the United States both the common schools and the higher schools have been organized with a unit plan of education—for all the people.

HISTORY OF EDUCATION

The practices of modern schools can be understood only in the light of history. Enough has been said in the introductory section to make it clear that the administrative units of modern American and European schools are descended directly from earlier forms of organization which grew up in various nations in response to the needs of the special types of civilization cultivated by these nations. But we may go much further than was indicated in the introduction. The details of instruction, including the materials in the course of study and the methods of classroom instruction, are dependent in all educational systems on the traditions which have come down from earlier times. Striking examples of this fact can be seen in the high respect in which the classics are held in American higher schools. This pre-eminence of the classics can be understood only when reference is had to the educational traditions of Europe. Furthermore, the methods of teaching in American and European schools are alike while the methods of Oriental schools are of a wholly different order.

In treating the history of education, it becomes necessary to draw a distinction between the school as an institution and certain personal influences which from time to time have appeared and have operated to reform institutional practices. The school as an institution tends to be conservative. Once its practices are established, it is natural for each succeeding generation of teachers to follow the examples of those who trained them. Progress or change in methods of teaching and in the courses of study usually depends on the vigorous efforts of some reformer who sees the inappropriateness for a later period of the educational procedures which have been brought down from an earlier age.

Reformers are seldom able to overcome altogether the conservatism of established institutions. The history of education is accordingly the account of a series of compromises between new ideas of what ought to be done and traditional practices which are thoroughly established.

For the purposes of our treatment, it is legitimate to treat in separate subdivisions first the institutions which have appeared in various countries at different times, and second the reformers who have labored to improve these institutions.

EDUCATIONAL INSTITUTIONS

Ancient systems of education must be understood as parts of the religious and governmental organization of the nations to which they belonged. Numerous glimpses into the educational system of Egypt are given by passages in the Old Testament. It is recorded that Moses was trained in all of the wisdom of the Pharaohs. This means that Moses, as a member of the royal family, was given the benefit of such knowledge as the governmental officials and priests of the day were able to accumulate and transmit.

Egyptian Education. Moses was in this respect absolutely separated from the other Hebrews, who, as slaves, enjoyed no privileges of education whatsoever. Moses was a member of the ruling class. His associates were the priests and princes. The priests had a body of knowledge which the common people did not possess. A curious and striking illustration of this can be given in the fact that these priests apparently knew enough about the science of optics to project from concave reflectors images of people on the walls of their temples and on the columns of smoke which rose from their altars. The projected images appeared to the common people like apparitions of their gods. The priests who knew how to make these projections are not to be charged with insincerity. They, undoubtedly, regarded these scientific secrets as gifts from the Deity, given them for the purpose of maintaining their control over the common people. They transmitted their knowledge of optics and other sciences, such as astronomy and architecture, to the rulers of the nation and to the members of their own priestly class, the training of princes and of novices for the priesthood being an important part of the work of every clerical community.

The educational system of Egypt was thus strictly a religious and royal institution carried on through the priests. The records show that schools for the young noblemen were organized in the palaces. Here discipline was severe and flogging was common. Instruction dealt largely with good manners, with ethical and political principles, and with such sciences as the priests and other teachers could command. The measurement of land was one subject taught. This was especially important in view of the necessity of relocating property after the inundations of the Nile. The boys were also taught swimming and gymnastics.

Greek Education. Greek education was of a somewhat different type. There had been developed in the Greek states a form of government which called for participation on the part of all the members of the aristocracy. Public debates among the members of the aristocracy were the common form of procedure in arriving at public decisions. Anyone who wanted to be a leader in the state must accordingly be prepared to speak in public and to maintain himself in an argument with his contemporaries. Training in rhetoric was, therefore, essential to the youth of the Greek states, and we find that special teachers of this subject exercised great influence in public affairs. Socrates (469–399 B. C.) was charged with having corrupted the youth of the land by the special form of logic and debate which he inaugurated. He was a philosopher and a teacher. He gathered about him a group of the younger men, taught them morals, and prepared them for participation in public life. Following his example, Plato (429–347 B. C.) and Aristotle (384–322 B. C.) conducted training classes for the young men of the aristocracy. The records of the sayings and teachings of these philosophers constitute a major contribution to European intellectual life. Again we must recognize the fact that these teachers were not connected with any public institution, but were influential because they gave a special type of training which was needed by the upper classes to maintain their social and political positions.

There was another important aspect of Greek education; it consisted in physical training in preparation for participation in the great national Olympic games. The Greeks prized perfection of bodily development most highly. They celebrated this perfection in the plastic art which still remains the wonder of the world. The youth of Greece were trained to run and to participate in other forms of physical exercise, and thus to perfect their bodies. In this way they were prepared to become formidable soldiers when they grew to be men. The prizes awarded at the Olympic games were regarded as great civic honors and were eagerly contested for by the young men fr m all the Grecian states.

Although the institutions which grew up among the Greeks were not perpetuated in the later periods of European education, the writings and teachings of the Greek philosophers exercised an enormous influence, furnishing in no small measure the materials which were used in all the higher schools of medieval and modern Europe. Thus the writings of Aristotle were the basis of scholastic education. The system of logic laid down by him was perfected until it became the chief subject of attention on the part of scholars.

The University of Alexandria. A part of the Greek influence came into Europe indirectly through the University of Alexandria where many great scholars worked. It was here that Euclid formulated about 300 B. C. the system of geometry which set forth in the form of strict Aristotelian syllogisms the

principles of land measurement which had been developed in Egypt and Greece. The Euclidean geometry which is still taught in our modern schools is a combined product of Greek and Egyptian education.

In theology as well as in the mathematical sciences, the influence of the University of Alexandria and the Greek schools was strong. Plato as well as Aristotle was accepted by many of the medieval scholars as an authority on matters of government and philosophy. His theory of the state which included a definition of education has been cited even in modern times as a proper basis for social organization. Plato was one of the authorities much studied in Alexandria and his doctrines were there worked over into a system of religious dogma.

Chinese Education. If we go to the Orient and consider the development of education in China, we find something which is a cross between the type of education found in Egypt and that which appeared in Greece. The great philosopher and teacher of China, Confucius (551–478 B. C.), laid the foundation for the political system of the Chinese state. His writings came to be of the greatest importance to anyone who intended to share in the government of China. Hence, the educational system of China centered about the writings of Confucius, and the young men of the country sought to make themselves masters by a process of merely memorizing all the maxims laid down by the great teacher.

There was a peculiar difficulty in the transmission of the maxims of Confucius, because the written language of the Chinese is clumsy and requires the very highest degree of specialization in order that the student may learn to read. Chinese written symbols were never simplified into a single alphabet, as were the written symbols of the Greeks. Each Chinese word is represented by a separate symbol. The labor of learning to read is, therefore, very considerable.

In recent years the Chinese schools have undergone a radical change through the stimulus of European and American models. The old formal scholastic training in Confucianism has rapidly given way. Since the People's Republic of China was formed, education has been designated as a responsibility of the provisional government under the general control of a Ministry of Education and Culture in the central government. Schools are organized at three levels: primary, secondary, and the University. In 1952 a standard five-year primary school was introduced. Children enter this school at seven years of age. Secondary education covers a period of six years and is divided into junior and senior secondary education with three years in each section. Technical and vocational schools are organized also. A 5-3-3-4 plan of organization is in effect with all students completing secondary education, eligible for the University. However, only a few of the secondary school graduates attend the University. In 1952 there were approximately 49 million children in primary schools, 3 million in secondary schools, and 220 thousand students enrolled in institutes of higher education.

Education in India. There has been a long tradition for education in India. When Europe was in the infancy of its culture, the Universities of India were flourishing and their scholars were respected throughout the then-known world.

In the past two hundred years English schools served as models for the schools of India, and Western ideas permeated education. After 1947 India engaged in a nation-wide attempt to develop education. There now is a central ministry whose main function is to plan, guide, and co-ordinate education for the entire country. An attempt is made to provide free schools at the primary and secondary levels for all children who want to attend them. At present, more than 24 million pupils are enrolled in primary and secondary schools, and approximately 400,000 students attend institutions of higher education. Education at the primary and secondary levels is financed by the State government, local bodies, and private organizations. Higher education is financed by private groups, the state, and the central government.

The entering age for primary schools is usually six years. The medium of instruction in the primary school is usually the mother tongue or the regional language. Secondary education has two stages: the middle school and the high school. The middle school follows the primary school and the length varies from two to four years. Subjects of the middle school, generally, are: the mother tongue, English, mathematics, geography, history, hygiene, nature study, classics, drawing, music, modern Indian languages, and physical training. The medium of instruction in some states is English and in others hindi or the regional language. The medium of instruction in most universities is English. Arts are most common in the University although science, technology, and professional subjects are gradually becoming more popular.

Roman Schools. The Roman boy of the earliest period was educated by his father. After 300 B. C. he was generally educated by a Greek slave. When the Roman state came into ascendancy and conquered the European provinces, Greece was gradually breaking up, and in 146 B. C. she became a conquered state. Learned Greeks came to Rome, in many instances as slaves of rich families. These learned Greeks were able to read; they knew the ancient literature of their race, and had some equipment in scientific knowledge. The Roman aristocracy was made up chiefly of warriors. There was, at the outset, no Roman literature to compare with the perfection of the writings of Homer and the other Greeks. The Greek slave was, therefore, a great asset in the Roman home. He took the boy in hand and gave him a type of knowledge which the father did not possess. From time to time, groups of families united in employing some especially competent Greek to instruct their boys.

Apparently, from the records, the boys in the Roman state were not especially eager to take on the training which the learned Greeks were prepared to offer them. Like the boys of all generations—but it seems in an unusual degree—the Roman boys were unruly and disorderly. Furthermore, from the conditions that have been described, it will be seen that the course of study which could be offered by the Greek was hardly suited to the taste and the future activities of most of the Roman boys. We have here one of the first examples of an imported education.

There were other forms of education in Rome, especially the military types of training. The boys were prepared for the army by strenuous physical exercises and by games, through which they were made vigorous in body and skillful in the use of all sorts of weapons. Physical education was, therefore, an important part of the training of the Roman youth. As contrasted with the Greek physical education, it aimed less at æsthetic development, and sought more to produce powers of resistance.

Charlemagne's Palace School. With the disintegration of the Roman state, Europe broke up into a number of half-civilized nations and tribes. As any one of the rulers in the early medieval period succeeded in enlarging his state and solidifying his government, he was compelled to set up some of the institutions of civilization. The most notable example of the establishment of a school in these early days is to be found in the Palace School of Charlemagne. Charlemagne had conquered a very large part of the western countries of Europe. He employed an English monk named Alcuin (735–804) to conduct a school which was attended by his sons and by the other princes of the royal group.

Alcuin prepared material for this school, and we have some curious examples of the textbooks which were used at that time. One of these is an arithmetic. The numbers were all expressed in Roman

numerals. It is not easy to carry on the more complex arithmetical operations if one uses Roman numerals. For example, if one tries to state a problem in multiplication in these numerals, one will readily see the difficulty that was encountered by Alcuin and his pupils. Take the problem, XXVII multiplied by XLIV; the multiplication thus expressed suggests no regularity of relations between the different numbers. As a matter of fact, Alcuin found it necessary to devise an elaborate system of addition which would give the results that the modern boy, who has the advantage of the Arabic numerals, can readily work out according to the modern multiplication tables. Alcuin gave the princes of Charlemagne's court, in spite of the difficulties which he encountered, the best training in arithmetic and in letters that his broad knowledge could command.

It is probably true also that at about this period some of the art and wisdom of the Arabs, who came into Europe by way of Spain, began to influence the intellectual life of the European nations. At all events, it is certainly true that, after the withdrawal of the Moors from Spain, literature and the sciences of mathematics and medicine developed more rapidly than they had in earlier years, and that schools of the higher type, referred to in the introduction as medieval universities, began to develop.

MEDIEVAL AND MODERN EUROPEAN SCHOOLS

The latter period of medieval education in Europe exhibits a number of different kinds of schools. There were the schools for knights, in which the younger members of the aristocracy learned to ride and hunt and to carry on the arts of war; there were medieval universities, which were schools of law, medicine, and theology. Later, various reform movements arose within and without the Church, yielding in many cases organized systems of education.

Jesuit Schools. Notable among the later systems of this type were the Jesuit colleges which flourished for centuries and are influential even in modern times, especially in Roman Catholic countries. These schools were maintained by the religious order established by Loyola, who was born in 1491. They were highly organized, with a carefully planned course of study designed not only for the training of novices who were to enter the religious order but also for the training of boys of the better families, who were to be governors and military leaders. The course of study always included liberal quantities of the Latin language, which was in universal use among the educated classes in the medieval period.

Latin. The Latin language had a unique place in medieval Europe, and the whole history of European education revolves around this subject. Not only was Latin taught because of its utility as a medium of communication, but it was the bearer to the medieval world of the older and vastly influential Roman civilization, which dominated the religious, legal, and military organization of every European state. The great cultural movement known as the Renaissance can be understood only when it is remembered that the nations of northern Europe were very dependent for their culture upon the art and literature of an earlier age.

The enthusiasm for the study of Greek and Latin during the 14th and 15th centuries reflects the dependence of the northern European nations upon the culture of the South. There are many indications that the intellectual awakening of the northern nations was accomplished by devoted study on the part of the clergy, as well as on the part of those who had literary tastes and who were not satisfied with the intellectual life provided by the Church. In a poem entitled "The Grammarian's Funeral," Browning has given a picture of the enthusiasm of the Renaissance for knowledge of Greek and Latin. The Grammarian is pictured as an old man who has devoted himself in his later years to the arduous studies necessary to master the Greek language. He had gathered about him a group of enthusiastic students, who, in the poem, are represented as following their master to his grave and celebrating in this ceremony their appreciation of the intellectual world which his studies had opened up to them.

The Classical Traditions. Classical and theological subjects were the chief studies in the higher schools of Europe. The establishment of the classical course was so complete that, throughout all of the later generations of European civilization, this course has been the characteristic feature of the higher schools. For example, in England it is only within recent years that the modern languages have had any adequate attention. In Germany, it required the personal influence of the former kaiser Wilhelm II to give standing in the higher schools to subjects other than the classical languages. The best higher schools of Europe today are still devoted to the classical traditions, and the classical languages have been brought over to the United States as important elements of the high school and college curriculum.

Secondary Education and the Classics. What is true of the universities is true of the schools which prepare students for the universities. Such schools are commonly called, following the French terminology, secondary schools. This term has come to have very general use. We speak of the American high school as a secondary school. In like fashion we speak of the French *lycée* and the German *Gymnasium* as secondary schools.

The development of secondary schools in Europe was first a succession of efforts to organize instruction in the classical languages, afterwards a slow growth of additional subjects, such as mathematics, and, at length, science and the modern languages. The various periods of this development are characterized by recurrences of enthusiasm for the content of Greek and Roman culture. The enthusiasm for the classics degenerated from time to time into mere attention to the grammatical and rhetorical forms of Latin authors. The periods of devotion to the content of classical culture are called periods of humanism.

There was a period, for example, during which the teachers of Latin were more interested in the use of a vocabulary and a style copied from Cicero than in the facts of Roman life or the facts of Greek culture. Formalism in expression dominated this period. It made very little difference what were the subjects of discourse so long as most of the phrases were of the Ciceronian type.

After each period of interest in form, there came a period of interest in the content of that which was read. For example, in Germany in the latter part of the 18th century the intellectual leaders of the nation, such as Goethe (1749–1832), Herder (1744–1803), and their contemporaries, rebelled against instruction in the mere forms of expression and inaugurated a reform which is known as "neo-humanism." This neo-humanism sought to find serenity and balance of life in a revival of Greek art and an imitation of Greek literature.

Similar alternations of interest in form and content have marked the whole history of the study of the classics. Even in modern times this same contrast appears. There are some teachers who defend Latin today on the ground that it is a perfected form of expression; while there are others who point out that a study of the classics is justified only in the degree in which it makes students acquainted with the experiences of earlier and highly developed nations.

New Secondary Subjects of Instruction. The later periods of secondary education have been complicated by the fact that many new subjects have been developed and are demanding a place in the scheme of education. The natural sciences developed rapidly after the 17th century, and it has

become increasingly important in modern times for every student who is going to be a leader in social and political life to know something of the natural sciences. Within the last century, the scope of scientific inquiry has vastly increased through the development of the biological as well as of the physical sciences. Commercial and industrial life have been modified and reorganized through the influence of these sciences, with the result that a higher education is altogether incomplete if it does not include a generous amount of training in natural science. Moreover, within the last two generations, the social sciences have been added to the natural sciences, and it has become apparent that in a complex society, such as that in which we live, it will be necessary, even in the lower schools, to give instruction in economics and the theory of government.

Among the purely literary subjects, also, there has been competition. Modern languages and the culture of modern nations, as well as the earlier civilizations of Rome and Greece, have come to be important for students. Secondary schools have accordingly adopted modern languages into their curriculum, and in some instances the effort has been made to substitute the modern for the ancient languages.

Slow Change in Traditions. Whatever have been the changes in the curriculum and in the organization of the secondary schools, these institutions have maintained their place in Europe as entirely separate from the schools for the common people. Thus, in England there are a number of famous and ancient endowed schools which still continue to train the aristocracy and still maintain the traditions of the medieval educational system. These schools are called "public schools." This name was adopted in the early history of such institutions as Rugby, Winchester, and Eton, because these schools differed from the tutorial system that was practiced in many of the homes of the aristocracy. Furthermore, it was common for the patrons who endowed these schools to give certain scholarships and to permit bright boys from among the common people to enjoy the advantages of a special education without cost to themselves. The institutions are not public in the sense in which free schools are public. Indeed, all European secondary schools charge a tuition. Furthermore, the so-called public schools of England continue to give a formal, classical course of study. It is the traditional theory of these English schools that, by studying Greek and Latin, boys can acquire the type of mental concentration and moral discipline necessary to make them competent officers in the army and satisfactory members of the civil service corps.

It has been the contention of many reformers, on the other hand, that the same ends could be much more advantageously attained if science and modern literature were substituted for the classics. Such a substitution, it is argued, would provide mental discipline and, at the same time, give the information necessary for intelligent participation in the activities of modern society. One writer whose essays have been a very large influence in promoting reform in English and American education in the direction of science and modern literature is the philosopher Herbert Spencer (1820–1903). His essays on education, published in 1861, were a vigorous attack upon the traditional classical system and a powerful plea in favor of science in secondary education.

The English municipalities have in recent years contributed to the reorganization of secondary education by establishing a new type of higher schools. These schools are known as municipal secondary schools. They are maintained by the industrial cities of England, such as Liverpool, Leeds, Birmingham, and Sheffield, and they give instruction in the sciences that are necessary for the maintenance of the industries in these various centers. They are open also, on a much more liberal scale than are the traditional schools, to the boys of the cities who are going into the industries and commercial life.

European Universities and Scholasticism. The European university has been from the first typically a professional school. At the outset, as was indicated in the introduction, each university center had its characteristic course. It was a school of theology or a school of medicine or a school of law. Later each institution set up a number of branches. The branches which were most common were those which have been mentioned, namely, theology, law, and medicine. There was also a general branch, known as the philosophy division of the university, in which a miscellaneous collection of literary and scientific subjects was provided. In this division of the university most of the new developments have taken place.

The universities of the medieval period were the homes of so-called "scholasticism." This word is often used as a term of reproach, from the point of view of modern educational thinking. It is commonly implied that scholasticism means mere formalism in thinking, as a substitute for productive originality.

There is ground for this notion that scholasticism was altogether formal. The common type of instruction was that which emphasized logical forms. The Aristotelian syllogism was the pattern which was adopted for all thinking. A science of logic was cultivated to the exclusion of interest in any real facts. The scholastics often debated purely artificial questions with a view to increasing their critical knowledge of the possible uses of the syllogism. Given certain premises for an argument, it made no difference to them whether the argument was practically productive or not. They merely wanted to make sure that the consequences of the premises assumed were carefully worked out. History tells of debates, between great leaders in this scholastic period, which continued day after day, and the debater who received the highest academic awards after one of these debates was the logician who was most competent in the use of syllogistic forms and in the exercise of criticism which attached to these forms.

While, however, there is ample ground for the statement that scholasticism was excessively formal, it should not be overlooked that this period devoted to the study of logic was of great significance in the development of the power to think in fine distinctions. The scholastics created, in the languages which they developed, an instrument for a later type of discriminating scientific thinking.

They also established the practice of research, that is, they set aside a group of people whom society was prepared to support for the purpose of developing an intellectual life which had no immediate practical bearings. There has always been some prejudice on the part of practical people against university organization, because it has been felt that the universities are in many instances remote from practical life; but the later history of higher institutions has shown that it is altogether to the advantage of society that science be cultivated for its own sake. The scholastics furnished the example which has been followed in later academic organization, and developed communities where intellectual life was pursued, first of all for its own sake and secondarily for the applications of science and letters to the needs of civilization.

Academic Freedom. One of the great struggles carried on in the universities of Europe was the contest for academic freedom. The patrons who supplied resources for the maintenance of universities tried from time to time to dominate the thinking of the teachers in these institutions. Great theological controversies sometimes arose in the universities. It will be remembered that Luther was in the University of Wittenberg when he first made his attack upon the theological doctrines which became the issues of the Reformation. Political issues also arose from time to time when some ruler objected to the teachings of those who were connected with the universities. But from the earliest

periods it was the contention of the universities that the teacher must be entirely free to follow the truth wherever he sees it, and the tradition has finally come to be thoroughly established that universities are to be free from any outside control.

English Academic Social Life. The English universities, in addition to the establishment of the right of the teacher to think freely, developed a social life of the most intense sort. One of the reasons why American students under the Rhodes scholarships find it advantageous to go to Oxford in England is that they are brought into close contact with a group of students who, during their university lives, are intimately associated in the dining halls and living quarters of the colleges of that university.

The English universities go so far in their emphasis on social life that they are hospitable to students who pursue their studies with such leisure that they are called mere "pass students." It is not uncommon for members of the wealthier classes to look upon the university life chiefly as a social opportunity. As distinguished from the "pass students" there are "honor students" who are looking forward to professional or academic careers which require rigorous scholarly preparation. It has been suggested by students of American higher institutions that a similar distinction to that made in English universities might advantageously be adopted in this country. It is asserted that there would then be a frank recognition of what is now in fact the true condition. It would relieve college authorities also of the necessity of living under the shadow of the pretense that all American students are hard-working scholars.

American Colleges. As compared with the European universities, the American college is a somewhat detached institution. It does not aim to give professional training, but is higher in its scholastic requirements than the secondary schools. We shall have occasion later to discuss more fully the development of this unique American institution, but it is to be noted here that the American college is in part borrowed from the English university. It is the social life of the American college which is frequently emphasized when one attempts to describe its relation to its students and its importance in our educational system.

Common Schools as Missionary Enterprises. The European school for the common people was in all of its earlier stages a missionary enterprise. As indicated in the introduction, the common school began as a result of the desire on the part of the Church authorities to train choir boys or to give general religious instruction to the common people. Luther and his colleagues in the Reformation recognized the importance of making the common people independent in their religious faith. Luther's translation of the Bible is a clear indication of his desire that they should have access to the means of religious independence. The training of the people to read the Bible was quite as important as the making of the translation. We find, therefore, that the leaders of the Reformation were in favor of schools and exercised their influence in the direction of the development of schools on a large scale for the common people.

What is true of the Reformation applies also to the efforts of later religious sects which developed in Europe and England, and it is true also in the Roman Catholic Church from which these various bodies separated. A few illustrations will serve to indicate the character of these movements for the establishment of mission schools for the common people. One of the most noted of these institutions was the school established at Halle by Francke (1663–1727). In 1695, Francke, who had had a broad academic and theological training, established in a suburb of the city in which he lived an evangelical organization which conducted as one of its major enterprises an orphan asylum and training school for teachers.

Francke was a member of the sect known as the Pietists. This religious group held to certain austere doctrines with regard to human nature, not unlike the doctrines held later by the Puritans. They believed that all children are born with an evil nature inherited from Adam and Eve and that it is necessary to change this nature by the most rigorous discipline, if the child is to be saved from eternal damnation. The rigor of Francke's discipline is illustrated in the following statement which he makes about children's play:

"Play must be forbidden in any and all of its forms. The children shall be instructed in this matter in such a way as to show them, through the presentation of religious principles, the wastefulness and folly of all play. They shall be led to see that play will distract their hearts and minds from God, the eternal Good, and will work nothing but harm to their spiritual lives. Their true joy and hearty devotion should be given to their blessed and holy Savior and not to earthly things, for the reward of those who seek earthly things is tears and sorrow."

In France, the common school was promoted by the activities of the religious order known as the Christian Brothers. This was an order of monks, founded in 1684 by Jean Baptiste de la Salle (1651–1719), which devoted itself to the betterment of the poor children of the country by giving training in the rudiments of knowledge to the boys and girls of the common people. The rule of the schools conducted by this order was that both pupils and teachers should keep silent throughout all of the day. Corporal punishment was common. The curriculum consisted in the rudiments of reading, writing, arithmetic, and religion.

In England, similar movements were carried forward, and led to the organization of schools which were, as will be seen by their very name, efforts on the part of philanthropic organizations to provide for the poorer people. The common schools of England were known as "pauper schools" or as "ragged schools." They were supported by various societies, such as the British and Foreign Missionary Society, and the Society for Bettering the Conditions and Increasing the Comforts of the Poor. A number of interesting experiments in the conduct of cheap schools were made under the auspices of these societies.

The so-called "monitorial" system was developed under the auspices of the society first mentioned above. In 1797, Dr. Andrew Bell (1753–1832) had suggested that the older boys in the orphan asylums could be used as instructors for the younger boys. At about the same time, Joseph Lancaster (1778–1838) organized a school in which a series of gradations was introduced, by which the teacher could come into direct contact with the older pupils, who in turn carried to the lower classes the instruction which they received from their teacher. Each child was provided with a knapsack in which he kept such books and material as he needed. A huge room was fitted with benches on which the children could sit, and in this way the teacher sometimes was able to take care of 1000 children.

The Lancastrian movement, as it is called, is of special interest because it was brought to New York and contributed to the early stages of development in American education. It provided one great advantage over schools which had preceded it. It compelled the grading of the children. The older groups, who were more mature and able to take instruction directly from the teacher, constituted the upper grades, and the younger children were organized in groups of different levels to receive instruction from these monitors.

Common Schools under Civil Patronage. A second type of development, acquaintance with which is of the greatest importance for an understanding of the history of common schools in Europe, is that which flourished first in Germany. Here, the rulers of political states very frequently united with the Church authorities in maintaining schools for

the training of the common people. The advantages of this combined action soon began to make themselves apparent in both the economic and the political life of the state. The taking over of the function of education by the political government was an innovation which ultimately exercised very great influence in the life of the nation.

In 1763, at the close of the Seven Years' war, Frederick the Great (1712–86) gave this general movement of state education a great impetus by issuing what is known as *The General School Regulation.* This order established for the first time the principle of compulsory attendance on the part of the children. It also provided that the teachers who conducted the schools should be specially trained for their duties and adequately compensated, and that the state would assume responsibility for this compensation. A policy of religious tolerance also was proclaimed in the *Regulation.* It is to be noted that religious instruction was not eliminated from the school curriculum by this proclamation of tolerance, but it was provided that families of different types of religious affiliation should be allowed to receive in public institutions the type of religious training which conformed to their beliefs.

The *Regulation* of Frederick drew the most violent opposition from the clergy and from many people who had come to think of the schools as strictly religious institutions, but it marked the beginning of a new era in educational matters. Because of their adequate support and strong organization, the Prussian schools have been the model for all other European school systems; and in many respects they furnish also the pattern for American schools.

The Influence of Prussian Schools. The direct influence of these Prussian schools on the other systems of Europe can be traced through a report which was prepared in 1833 by a French commissioner named Cousin (1792–1867). The French schools, as indicated in an earlier paragraph, were first maintained by religious orders, but at the time Cousin made his report there was great interest in the organization of public support for schools which should admit children of all classes. Cousin went to Prussia, and made an exhaustive report on the organization and course of study of the common schools. This report was widely distributed in France. It was translated into English, and had a large influence in England and the United States in bringing about a new type of organization of public schools.

The Prussian school for the common people had at this time come to be a school which took charge of the children from six to fourteen years of age. It is interesting to comment on the reason for the adoption of fourteen years of age as the upper limit for school attendance. The original practice in German schools was to leave to the pastors the decision as to when children were mature enough to leave the school and be confirmed in the Church. Pastors gradually found that the age of fourteen was approximately the age at which they could approve the conclusion of the training course in the schools and could admit children to the Church. Throughout the civilized world, compulsory education laws have been passed, following the example of these German pastors in setting the age of fourteen years as that at which common school training is regarded as completed. Many of the reforms which are being suggested at the present time in American school organization will be more clearly understood if it is remembered that the upper limit of the common school was thus determined through a European organization which is in fact wholly different in character from the common school of the United States.

The secular organization of education in Germany prepared the way for a modern development which has been of great importance. These schools were among the first to be supplemented by a system of industrial education. The secular ruler was naturally much interested in the economic welfare of his people. Accordingly, he was willing to provide for the training of children in the trades.

The tendency to provide practical education was further powerfully re-enforced by the writings of some of the educational reformers who will be discussed in another section.

EDUCATION IN AMERICA

The educational system of America, during the Colonial period, was in part an imitation of the European system. Three grades of schools were to be found in the American colonies. There was, first of all, the highest institution, or college. The three institutions of this type which have exercised the greatest influence in American education are Harvard (founded in 1636), Yale (founded in 1701), and Princeton (founded in 1746). These institutions were organized by the clergy for the purpose of training boys to become members of their own profession. Closely connected with the colleges were the Latin grammar schools. These were modeled on the European secondary schools which administered a classical course of study and accepted pupils of the better social grades from the families which could afford to pay tuition. Finally, there was a common school which in its organization was influenced from the beginning by the European people's school.

Local Control of American Schools. The American common school differed from the European school in that it was from the outset an expression of the desire on the part of the American colonies to develop a type of intellectual freedom not prevalent in Europe. There are two further characteristics of the American common school which have distinguished it from its European predecessors. In the first place, the school was, from the beginning, controlled by local authority. Communities were indeed compelled by early legislation in the colonies to maintain an educational institution of some kind for the young people, but the details of organization were left to the communities.

We find that there was the greatest variety in the method of controlling these schools. In New England the town meeting determined the policy of the school. It set the salary of the teacher, and very frequently went so far as to select the teacher, although it commonly delegated supervision of the school to a trustee or to a committee. This committee often included the pastor of the church and one or more of the leading citizens.

The southern colonies differed from the New England colonies in their attitude toward education. To these southern colonies, especially to Virginia, had come Englishmen who brought with them the traditions of the English aristocracy. They usually lived on plantations so large that their neighbors were far removed, and the demand for any community life was, accordingly, much reduced. Virginia, therefore, did not have any town meeting which could control the school, and, because of the great distances between families having children of the same social level, schools were not organized. The young people were sent from the Virginia plantations back to England for their education, or they were trained by tutors at home.

In New York, the Dutch company which had large concessions sometimes provided schools as part of the inducement to immigrants to settle its lands. In Pennsylvania, William Penn (1644–1718) saw the importance of providing education for the children as a part of the general scheme of social organization. In these cases, however, the schools were left to the control of the community to a degree unknown in the European countries.

American Schools, Reading Schools. A second distinguishing fact about American schools is that they were reading schools. Instruction in the European schools was given orally by a teacher who was professionally trained and authorized to instruct the children. The colonies, unprovided with skilled teachers and unable to equip these teachers

This Bicentennial exhibit at the Center of Science and Industry in Columbus, Ohio, features talking wax replicas of all the **American Presidents.** A recorded message with a biographical sketch and a famous quote by each president is heard on pressing a button on the panel directly in front of the exhibit. *(Photo courtesy COSI, Columbus, Ohio)*

This antique doll display at COSI features **dolls of early America.** The first dolls were brought to America by William Penn in 1699, although they were not called *dolls* until around 1750. In the American Colonies they were called "little ladies." Early American dolls were made of wood, china, wax, or bisque, a type of earthenware. The dolls pictured here are made of bisque. *(Photo courtesy COSI, Columbus, Ohio)*

These exhibits show the early American **spinning wheel** being used. The spinning wheel, used for making thread from cotton, flax, and wool fibers, was introduced to Europe from India in the 14th century. The spinning wheel arrived in America in the 17th century. Spinning was usually done by young women and from this comes the word "spinster." *(Photo courtesy Center of Science and Industry, Columbus, Ohio)*

with any technical preparation for their work, were satisfied to conduct schools as best they could, employing anyone to teach who could be secured for the relatively small wage which the community was able to provide. But there was one ambition which prompted the organization of the schools, especially in the New England colonies. It is clearly expressed in the preamble of the school laws of these colonies. A quotation from the school law of Connecticut, adopted in 1650, and resembling very closely the early law of Massachusetts, adopted in 1647, will make clear the purpose of the colonies in establishing their first common schools.

"It being one chief project of that old deluder, Satan, to keep men from a knowledge of the Scriptures, as in former times, keeping them in an unknown tongue, so in these latter times, by persuading them from the use of tongues, so that at least, the true sense and meaning of the original might be clouded by false glosses of saint-seeming deceivers; and that learning may not be buried in the grave of our forefathers," (the court decreed that whenever a township increased to fifty householders they should employ some one) "to teach all such children as shall resort to him, to write and read."

The influence of this legislation has been of great importance in the American schools. Throughout our history, emphasis on reading has controlled the form of organization of all classroom instruction. Reading books have been provided, in contrast to the oral instruction which is typical of European schools. The method of instruction has included preparation of lessons at home out of books, and the recitation has been from the first the typical form of classroom exercise in these schools.

Industrial Training. There was one further ambition in the minds of the New England colonists as to the training of their young people. It is expressed in the statute adopted at about the same time as that quoted above. This second statute aimed to provide training in industry for all of the children. The statute is as follows:

"All parents and masters do breed and bring up their children and apprentices in some honest lawful labor, or employment, either in husbandry or some other trade profitable for themselves and the commonwealth, if they will not nor cannot train them up in learning, to fit them for higher employment, and if any of the selectmen, after admonition by them given to such masters of families, shall find them still negligent of their duty . . . the said selectmen, with the help of two magistrates, shall take such children or apprentices from them, and place them with some masters for years, boys until they come to be twenty-one, and girls to eighteen years of age complete."

This statute did not exercise any large influence, because it did not provide adequate administrative machinery for enforcement. It is not until a relatively late period in the history of American education that industrial training reappears as an important part of the system.

Early Methods of Paying for Schools. In the matter of support, there was great variety of practice in the different colonies and in the different grades of schools. In the main, it may be said that higher education was never free, and in many instances the elementary schools were supported in part by payments made by the pupils. There was practically no full community support of schools until long after the establishment of the present Federal government of the United States. Indeed, as late as 1873, the last of the Northern states to abandon pupil payment was still receiving some support for the teacher from so-called "rate bills" paid by the pupil. Even in colonial times, however, partial support of the school out of the community treasury had begun. Accordingly, common schools have been from the first, so far as the public could make them so, free schools.

Early Schools and Lack of Organization. By way of negative statement, it may be pointed out that the early colonial schools were not graded. They were one-teacher schools, and in the form of their organization were of the type known even in modern times as "the district school." The teacher organized such classes as he or she was able to conduct, and the pupils were distributed according to their various abilities in the different subjects. The school term was often very short. Sometimes, the school year was divided into a winter term and a summer term; the latter was attended by the younger children, and the former by the older children. The original school laws of the northern colonies very frequently prescribed 4 to 21 as the ages for attendance on school. Later the European model of closing the elementary schools to students at about 14 years of age came to be adopted, but the original plan of American school organization was at once loose and comprehensive.

Early Schools, Religious but Secular. The schools of the American colonies were secular; that is, they were set up by the law of the colonies and were governed by the community rather than by the church. They were at first, however, religious in the content of their teaching. The reading books were full of quotations from the Bible and the catechism. The religious content of instruction reflects the main interest of the community. Nevertheless, the control and organization were secular. The consequence of this has been that, in modern times, the separation of the public school and the Church has been complete, and religious teaching has gradually disappeared.

The development of parochial schools in this country reflects the desire on the part of certain religious bodies to control, more completely than is possible in the public schools, the religious and moral education of their children.

Schools in the Early National Period. Between the Colonial period and the present, there is a pronounced break in the history of American schools. The Revolutionary War left the colonies in many cases financially weak and detached from the sources of their earlier social life and traditions. The Constitutional Convention, which established the national government, did not include education as one of the matters to be dealt with by the new Federal government. There was in fact so much disagreement between the practices of the northern and the southern colonies in matters of school organization that it was deemed wiser to leave schools to local control. The tendencies toward decentralized organization which appeared in the colonies thus became a part of the national policy. It was not until the middle of the last century that the Federal government made any provision for the consideration of educational problems. In 1867 an office of education was established, first as an independent department and in 1868 as an office of the department of the interior. This office, however, has no authority of any kind whatsoever over the schools in the different states. It is merely an agency for collecting information. The fact that the Federal Constitution does not mention education leaves the control of public schools to the states.

Since, during the early years of American history, the states were busily engaged in developing the material resources necessary for the life of the people, education was carried on in a somewhat irregular fashion, in accordance with the plans which had been set up during the Colonial period; but it was very meager. The United States office of education has estimated that in 1800 the average American citizen was not receiving more than 82 days of schooling in his lifetime. Many communities had no schools, sometimes because families were so isolated, and sometimes because teachers could not be found. The educational situation during the first decades of American national life was wholly chaotic.

A Typical Report. A report prepared by the committee which visited the schools of Taunton, Massachusetts, in 1801 throws so much light on the general situation early in the last century that parts of it may be quoted as exhibiting the conditions common at that time:

"The committee chosen by the town to inspect the schools beg leave to report their situation and examination . . . " January 6th, 1801. Your committee visited a school kept in Rueben Richmond's house instructed by Mrs. Nabby Williams of 32 scholars. This school appeared in an uncultivated state the greater part of the scholars.

"On the 26 of Feb. visited Mrs. Nabby Williams' school the second time and found that the scholars had made great proficiency in reading, spelling, writing and some in the grammar of the English language.
